Geology. *Geology.*—In a geological point of view France may be divided into three great regions, which comprehend a nearly complete series of the different kinds of soils.

1. *Mountains.*

(*a.*) Granite and Schist.

Alpes.—Part of Isère (S.E.); Drôme; Hautes-Alpes; part of Basses-Alpes (E.); Savoie; Haute-Savoie.
Pyrénées.—Part of Aude (S.E.); Pyrénées-Orientales; part of Ariége (S.), of Haute-Garonne (S.), of Hautes-Pyrénées (S.), and of Basses-Pyrénées (S.W.).
Vosges.—Part of Vosges (E.).
Maures.—Part of Var (S.E.).

(*b.*) Limestone.

Jura.—Doubs; Jura; part of Ain (E.).
Provence.—Part of Basses-Alpes (W.) and of Var (N.W.); Vaucluse; Bouches-du-Rhône.

2. *Plateaus.*

(*a.*) Granite and Schist.

Central Plateau.—Part of Nièvre (E.) and of Saône-et-Loire (W.); Rhône; Loire; Ardèche; part of Gard (W.), of Allier, and of Puy-de-Dôme (E. and W.); Haute-Loire; part of Lozère (N.); Creuse; Haute-Vienne; Corrèze; Cantal; part of Aveyron (N.) and of Tarn (E.).
Ardennes.—Part of Ardennes (N.).
Bretagne.—Part of Orne (W.); Mayenne; part of Maine-et-Loire (W.) and of Deux-Sèvres (N.W.); Manche; Ille-et-Vilaine; Loire-Inférieure; Vendée; Côtes-du-Nord; Morbihan; Finistère.

(*b.*) Limestone.

Causses.—Part of Lozère (S.) and of Aveyron (S.).
Languedoc.—Part of Gard (E.); Hérault.
Quercy.—Lot.
Haut Poitou.—Part of Vienne (S.), of Charente (N.), and of Deux-Sèvres (N.).
Bourgogne.—Haute-Saône; Haute-Marne; Côte-d'Or; part of Yonne (S.E.) and of Nièvre (W.).
Lorraine.—Moselle; Muerthe; part of Vosges (W.); Meuse.

3. *Level Tracts.*

Champagne.—Aube; Marne; Ardennes.
Neustrie.—Nord; Aisne; Seine-et-Marne; part of Yonne (N.W.); Pas-de-Calais; Somme; Oise; Seine-et-Oise; Seine; Loiret; Cher; Seine-Inférieure; Eure; Eure-et-Loire; Loir-et-Cher; Indre; Calvados; part of Orne (E.); Sarthe; Indre-et-Loire; part of Vienne (N.) and of Maine-et-Loire (E.).
Aquitaine.—Part of Tarn (W.) and of Aude (N.W.); Tarn-et-Garonne; part of Haute-Garonne (N.), of Ariége (N.) and of Charente (S.); Dordogne; Lot-et-Garonne; part of Hautes-Pyrénées (N.); Charente-Inférieure; Landes; part of Basses-Pyrénées (N.E.).
Limagne.—Part of Allier (W.) and of Puy-de-Dôme (central part).
Bresse.—Part of Côte-d'Or (E.), of Saône-et-Loire (E.), of Ain (W.) and of Isère (N.W.).

The following table shows the same districts classified according to the nature of their soils. It will be remarked that the Tertiary rock forms nearly the third part of France, whilst the coal-fields are scarcely the two-hundredth part of it.

Primitive rock.—Vendée, part of Brittany, part of the Maures, the Vosges, and the Alps—10,416,000 hectares (40,217 square miles).
Transition rock.—Pyrenees, central part of Brittany, Cotentin, Ardenne, part of the Vosges—5,200,000 hectares (20,077 square miles).
Porphyritic and Carboniferous rocks.—North of Ardenne; north-west of the central plateau; the Maures; small portions of the surface in the Corbières, Brittany, and the Vosges—520,000 hectares (2007 square miles).
Triassic and Permian rock.—East of Lorraine, and a small part of the Vosges—3,480,000 hectares (12,436 square miles).
Jurassic rock.—The Causses, Quercy, and Haut-Poitou; Lorraine and Burgundy; part of the Alps—10,371,000 hectares (39,943 square miles).
Chalk.—Champagne, west of Neustrie, and some places in Aquitaine and the Pyrenees—6,245,700 hectares (24,115 square miles).
Tertiary rock.—The greater part of Neustrie, Limagne, Aquitaine, Bresse, part of Languedoc, Provence, and some places in Brittany and Vendée—14,853,500 hectares (57,350 square miles).
Volcanic rock.—Several masses in the central plateau, and various places in the Causses, Languedoc, Provence, the Maures, and Lorraine—520,000 hectares (2007 square miles).
Alluvial soils.—These are to be found in all valleys, but chiefly near Dunkirk and Niort, and on the Mediterranean coasts—520,000 hectares (2007 square miles).

The *Statisque générale* of France divides the soil thus:—

	Hectares.	Square miles.
Mountainous tracts	4,268,750	16,481
Heaths and moors (landes)	5,670,089	21,892
Soil of rich moulds	7,276,369	28,094
Chalk or limestone	9,788,197	37,793
Gravel	3,417,893	13,196
Stony soil	6,612,348	25,530
Sandy soil	5,921,377	22,863
Clay	2,232,885	8,611
Marshy and swampy soil	284,454	1,098
Miscellaneous	7,290,238	28,148

Or, considering the use rather than the nature of the soil, the surface of France may be divided thus:—

	Hectares.	Square miles.
Arable land	25,500,675	98,460
Forests, woods, and parks	8,800,399	33,978
Heaths and moors (landes)	7,138,282	27,551
Meadowland	5,159,179	19,920
Vineyards	2,088,048	8,062
Roads, streets, public walks, and built lands	1,361,757	5,157
Water	737,587	2,837
Orchards and gardens	627,704	2,423
Chestnut plantations	559,029	2,158
Olive, almond, and mulberry plantations	109,262	421
Miscellaneous	775,753	2,955

II. *Population.*

The population of France, which in 1801 was 27,349,003, was 36,905,788 in 1876, of whom 11,405,000 were living in towns. The following table shows the extent of each department and the population in 1861 and 1876.[1]

	Surface in Square Miles.	Population in 1861.	Population in 1876.
Ain	2,239	369,767	365,462
Aisne	2,839	564,597	560,427
Allier	2,822	356,432	405,783
Alpes (Basses-)	2,685	146,368	136,166
Alpes (Hautes-)	2,158	125,100	119,094
Alpes-Maritimes	1,512	194,578	203,604
Ardèche	2,134	388,529	384,378
Ardennes	2,020	329,111	326,782
Ariége	1,890	251,850	244,795
Aube	2,317	262,785	255,217
Aude	2,438	283,606	300,065
Aveyron	3,376	396,025	413,826
Belfort (territory of)	235	.....	68,600
Bouches-du-Rhône	1,971	507,112	556,379
Calvados	2,132	480,992	450,220
Cantal	2,217	240,523	231,086
Charente	2,294	379,081	373,950
Charente-Inférieure	2,636	481,060	465,628
Cher	2,779	323,393	345,613
Corrèze	2,265	310,118	311,535
Corse	3,377	252,889	262,701
Côte-d'Or	3,383	384,140	377,663
Côtes-du-Nord	2,652	628,676	630,957
Creuse	2,150	270,055	278,423
Dordogne	3,545	501,687	489,848
Doubs	2,019	296,280	306,094
Drôme	2,518	326,684	321,756
Eure	2,300	398,661	373,629
Eure-et-Loir	2,268	290,455	283,075
Finistère	2,595	627,304	666,106
Gard	2,253	422,107	423,804
Garonne (Haute-)	2,429	484,081	477,730
Gers	2,425	298,931	283,546
Gironde	3,761	667,193	735,242

[1] After the cession of territory to Germany in 1871, a single department (Meurthe-et-Moselle) takes the place of two (Meurthe and Moselle), the Bas-Rhin disappears, and of the Haut-Rhin there remains only the territory of Belfort.

	Surface in Square Miles.	Population in 1861.	Population in 1876.
Hérault	2,393	409,391	445,053
Ille-et-Vilaine	2,597	584,930	602,702
Indre	2,624	270,054	281,248
Indre-et-Loire	2,360	323,572	324,875
Isère	3,201	577,748	581,099
Jura	1,928	298,053	288,823
Landes	3,597	300,839	303,508

Vienne	2,691	322,028	330,916
Vienne (Haute-)	2,130	319,595	336,061
Vosges	2,259	415,485	407,082
Yonne	2,868	370,305	359,070
Total	204,147	37,472,732	36,905,788

The annual increase of population in France between 1801 and 1876 has been very small. Allowing for the alterations in extent of territory which took place in 1860 and in 1871, it amounts to about 0·43 per cent.; so that while in England the population during the same period has been doubling in about 53 years, it would require 161 years to bring about a similar result in France. The census of 1876 returned 18,373,639 males and 18,532,149 females, of whom 9,805,761 males and 8,944,386 females were single. In 1874 there were 954,652 births, 981,709 deaths, and 303,113 marriages; of the births 69,294 were illegitimate, and 44,613 were children stillborn. Population is not so dense in France as in the United Kingdom, the proportions being about 181 and 270 inhabitants respectively to the square mile.

	Men.	Women.	Total Number.
Agriculture	4,664,855	1,305,316	5,970,171
Manufactures	2,673,997	1,308,873	3,982,870
Commerce	1,181,514	308,754	1,490,268
Liberal professions	832,692	161,740	994,432
Persons living on their income	545,050	425,534	980,584
Without profession, or profession unknown	.....	.....	980,939

The preceding table of the population arranged according to employments (exclusive of children and servants) is taken from the census of 1872.

The first of the following tables shows the population for 1832, 1851, and 1876 of the towns in France that had upwards of 50,000 inhabitants in the last-mentioned year:—

	1832.	1851.	1876.
Paris	774,338	1,053,262	1,988,806
Lyons (*Fr.* Lyon)	133,715	156,169	322,612
Marseilles (*Fr.* Marseille)	145,115	185,082	234,690
Bordeaux	99,062	123,935	212,111
Lille	69,073	68,463	137,150
Toulouse	59,630	85,554	120,208
St. Étienne	.....	53,741	117,537
Nantes	77,992	91,303	116,093
Rouen	88,086	91,512	104,893
Havre-de-Grâce	23,816	26,410	85,407
Rheims (*Fr.* Reims)	35,971	43,643	80,098
Roubaix	.....	31,038	74,946
Brest	29,860	36,492	66,828
Nancy	29,783	40,289	66,303
Amiens	45,001	49,139	61,606
Toulon	28,419	45,510	61,382
Nîmes	41,266	49,480	60,804
Angers	32,743	43,088	55,366
Limoges	27,070	37,010	55,097
Rennes	29,680	33,066	53,598
Montpellier	35,825	40,222	51,838

Towns with from 20,000 to 50,000 Inhabitants in 1876.

Orléans	49,896	Arras	26,764
Versailles	49,552	Rochefort	25,454
Tours	48,325	Laval	25,110
Nice	46,683	Perpignan	24,379
Le Mans	45,709	Carcassonne	23,517
Dijon	45,607	Aix	23,407
Grenoble	43,054	Douai	23,348
Besançon	42,808	Périgueux	23,290
Troyes	41,275	Vienne	22,950
Boulogne (Pas de Calais)	40,075	Levallois-Perret	22,733
St. Quentin	37,980	Valenciennes	22,686
Clermont-Ferrand	37,074	St. Pierre-lès-Calais	22,349
Béziers	36,928	Bayonne	22,307
Cherbourg	36,338	Elbeuf	21,935
Dunkirk (*Fr.* Dunkerque)	35,012	Montluçon	21,904
Avignon	33,189	Boulogne (Seine)	21,556
Caen	33,072	Roanne	21,472

Angoulême	28,625	Armentières	20,565
Cette	28,152	Castres	20,520
Pau	27,553	Valence	20,476
		Niort	20,336
		Châlons-sur-Marne	20,215

III. *Government and Administration.*

The Government.

The governments and constitutions which have ruled France since 1789 have been many, and have presented wide differences. We have not, however, to consider here those frequent changes, which belong to history; we have merely to state from a geographical and statistical point of view how France is now governed and administered. The law of the 25th February, 1875, confirmed in France the republican government which had existed from the fall of the empire; but the institutions of the country still bear strong evidence of their monarchical origin and tendency. The sovereignty of the people, acknowledged and proclaimed since 1789, is now represented by three powers,—the chamber of deputies, the senate, and the president of the republic.

Chamber of deputies.

The deputies are elected by universal suffrage; each district or "arrondissement" sends one deputy to the chamber, if its population does not exceed 100,000, and an additional deputy for every additional 100,000 inhabitants, or fraction of that number.

Senate.

The senate consists of 300 members, the fourth part of whom were at first elected by the national assembly, and hold office for life, each vacancy being filled up by a vote of the senate. The others are elected by special bodies formed, in each department and in the colonies, by the deputies, the general councillors, the councillors of arrondissement, and a delegate of each municipal council. They are in office for nine years,

Departments.	Capital Towns.	Arrondissements.	Ancient Provinces.
Ain	Bourg	5. Bourg; Belley; Gex; Nantua; Trévoux	Bourgogne (Bresse, Bugey, Dombes).
Aisne	Laon	5. Laon; Château-Thierry; Soissons; St. Quentin; Vervins	Ile-de-France; Picardie; Champagne (Brie).
Allier	Moulins	4. Moulius; Gannat; La Palisse; Montluçon	Bourbonnais.
Alpes (Basses-)	Digne	5. Digne; Barcelonnette; Castellane; Forcalquier; Sisteron	Haute-Provence.
Alpes (Hautes-)	Gap	3. Gap; Briaucon; Embrun	Haute-Dauphiné; Provence.
Alpes-Maritimes	Nice	3. Nice; Grasse; Puget-Théniers.	
Ardèche	Privas	3. Privas; Largentière; Tournon	Languedoc (Vivarais).
Ardennes	Mézières	5. Mézières; Rethel; Rocroi; Sedan; Vouziers	Champagne (Réthelais, Rémois).
Ariége	Foix	3. Foix; Pamiers; St. Girons	Foix; Gascogne (Conserans).
Aube	Troyes	5. Troyes; Nogent-sur-Seine; Arcis-sur-Aube; Bar-sur-Aube; Bar-sur-Seine	Champagne; Bourgogne.
Aude	Carcassonne	4. Carcassonne; Castelnaudary; Limoux; Narbonne	Bas Languedoc.
Aveyron	Rodez	5. Rodez; Espalion; Millau; St. Affrique; Villefranche	Guyenne (Rouergue).
Belfort	Belfort	1. Belfort	Alsace.
Bouches-du-Rhône	Marseille	3. Marseille; Aix; Arles	Basse-Provence.
Calvados	Caen	6. Caen; Bayeux; Falaise; Lisieux; Pont-L'Evêque; Vire	Basse-Normandie (Bessin, Bocage).
Cantal	Aurillac	4. Aurillac; Mauriac; Murat; St. Flour	Haute-Auvergne.
Charente	Angoulême	5. Angoulême; Barbezieux; Cognac; Confolens; Ruffec	Angoumois; Charente; Poitou.
Charente-Inférieure	La Rochelle	6. La Rochelle; Jonzac; Marennes; Rochefort; St.-Jean-d'Angely; Saintes	Aunis; Saintonge.
Cher	Bourges	3. Bourges; St. Amand-Mont-Rond; Sancerre	Haut-Berry; Bas-Bourbonnais.
Corrèze	Tulle	3. Tulle; Brive; Ussel	Bas-Limousin.
Côte-d'Or	Dijon	4. Dijon; Beaune; Châtillon-sur-Seine; Semur	Bourgogne (Dijonais, Auxerrois).
Côtes-du-Nord	St. Brieuc	5. St. Brieuc; Dinan; Guingamp; Lannion; Loudéac	Haute-Bretagne.
Creuse	Guéret	4. Guéret; Aubusson; Bourganeuf; Boussac	Haute-Marche.
Dordogne	Périgueux	5. Périgueux; Bergerac; Nontron; Ribérac; Sarlat	Guyenne (Périgord).
Doubs	Besançon	4. Besançon; Baume-les-Dames; Montbéliard; Pontarlier	Franche-Comté; Montbéliard.
Drôme	Valence	4. Valence; Die; Montélimart; Nyons	Bas-Dauphiné.
Eure	Evreux	5. Evreux; Les Andelys; Bernay; Lonviers; Pont-Audemer	Haute-Normandie (Evreux, Vexin Normand).
Eure-et-Loir	Chartres	4. Chartres; Châteaudun; Dreux; Nogent-le-Rotrou	Orléanais (Pays chartrain); Perche.
Finistère	Quimper	5. Quimper; Brest; Châteaulin; Morlaix; Quimperlé	Basse-Bretagne.
Gard	Nîmes	4. Nîmes; Alais; Le Vigan; Uzès	Bas-Languedoc.
Garonne (Haute-)	Toulouse	4. Toulouse; Muret; St. Gaudens; Villefranche	Haute-Languedoc; Gascogne (Comminges).
Gers	Auch	5. Auch; Condom; Lectoure; Lombez; Mirande	Gascogne (Astarac, Armagnac).
Gironde	Bordeaux	6. Bordeaux; Bazas; Blaye; La Réole; Lesparre; Libourne	Guyenne (Bordelais, Médoc, Bazadais).
Hérault	Montpellier	4. Montpellier; Béziers; Lodève; St. Pons	Bas-Languedoc.
Ille-et-Vilaine	Rennes	6. Rennes; Fougères; Montfort; Redon; St. Malo; Vitré	Haute-Bretagne.
Indre	Châteauroux	4. Châteauronx; Le Blanc; La Châtre; Issoudun	Bas-Berry; Touralne.
Indre-et-Loire	Tours	3. Tours; Chinon; Loches	Touraine; Anjou; Orléanais; Poitou.
Isère	Grenoble	4. Grenoble; La-Tour-du-Pin; St. Marcellin; Vienne	Haut-Dauphiné (Graisivaudan); Bas-Dauphiné (Viennois).
Jura	Lons-le-Saulnier	4. Lons-le-Saulnier; Dôle; Poligny; St. Claude	Franche-Comté (Aval).
Landes	Mont-de-Marsan	3. Mont-de-Marsan; Dax; St. Sever	Gascogne (Landes, Chalosse).
Loire	St. Etienne	3. St. Etienne; Montbrison; Roanne	Lyonnais (Forez, Beaujolais).
Loire (Haute-)	Le Puy	3. Le Puy; Brioude; Yssingeaux	Languedoc (Velay, Haute-Auvergne).
Loire-Inférieure	Nantes	5. Nantes; Ancenis; Châteaubriant; Paimbœuf; St. Nazaire	Haute-Bretagne.
Loiret	Orléans	4. Orléans; Gien; Montargis; Pithiviers	Orléanais (Sologne, Gâtinais).
Loir-et-Cher	Blois	3. Blois; Romorantin; Vendôme	Orléanais (Blaisois, Beauce).
Lot	Cahors	3. Cahors; Figeac; Gourdon	Guyenne (Quercy).
Lot-et-Garonne	Agen	4. Agen; Marmande; Nérac; Villeneuve-d'Agen	Guyenne (Agénois, Gascogne).
Lozère	Mende	3. Mende; Florac; Marjevols	Languedoc (Gévandan).
Maine-et-Loire	Angers	5. Angers; Baugé; Cholet; Saumur; Segré	Anjou.
Manche	St. Lô	6. St. Lô; Avranches; Cherbourg; Coutances; Mortain; Valognes	Basse-Normandie (Cotentin).
Marne	Châlons	5. Châlons; Epernay; Rheims; Ste. Menehould; Vitry-le-François	Champagne (Brie, Perthois, Rémois).
Haute-Marne	Chaumont	3. Chaumont; Langres; Vassy	Champagne (Bastigny, Vallage).
Mayenne	Laval	3. Laval; Château-Gontier; Mayenne	Haut-Maine; Haut-Anjou.
Meurthe-et-Moselle	Nancy	4. Nancy; Briey; Lunéville; Toul	Lorraine (Toulois).
Meuse	Bar-le-Duc	4. Bar-le-Duc; Commercy; Montmédy; Verdun	Lorraine (Bar, Verdunois).
Morbihan	Vannes	4. Vannes; Lorient; Ploërmel; Pontivy	Basse-Bretagne.
Nièvre	Nevers	4. Nevers; Château-Chinon; Clamecy; Cosne	Nivernais; Orléanais; Bourgogne.
Nord	Lille	7. Lille; Avesnes; Cambrai; Douai; Dunkirk; Hazebrouck; Valenciennes	Flandre; Hainaut (Cambrésis).
Oise	Beauvais	4. Beauvais; Clermont; Compiègne; Senlis	Ile-de-France; Beauvaisis (Vexin); Haute-Picardie.
Orne	Alençon	4. Alençon; Argentan; Domfront; Mortagne	Normandie (Marches, Houlme); Maine (Perche).
Pas-de-Calais	Arras	6. Arras; Béthune; Boulogne; Montreuil-sur-Mer; St.-Omer; St.-Pol	Artois; Picardie; Boulonnois.
Puy-de-Dôme	Clermont-Ferrand	5. Clermont-Ferrand; Ambert; Issoire; Riom; Thiers	Basse-Auvergne (Limagne).
Pyrénées (Basses-)	Pau	5. Pau; Bayonne; Mauléon; Oloron; Orthez	Béarn; Basse-Navarre; Gascogne (Soule, Labour).
Pyrénées (Hautes-)	Tarbes	3. Tarbes; Argèles; Bagnères	Gascogne (Bigorre, les Quatre-Vallées).
Pyrénées-Orientales	Perpignan	3. Perpignan; Céret; Prades	Roussillon (Cerdagne); Bas-Languedoc.
Rhône	Lyon	2. Lyon; Villefranche	Lyonnais; Beaujolais.
Saône (Haute-)	Vesoul	3. Vesoul; Gray; Lure	Franche-Comté (Amont).
Saône-et-Loire	Mâcon	5. Mâcon; Autun; Châlon-sur-Saône; Charolles; Louhans	Bourgogne (Mâconnais, Charolais).
Sarthe	Le Mans	4. Le Mans; La Flèche; Mamers; St. Calais	Bas-Maine; Haut-Anjou.
Savoie	Chambéry	4. Chambéry; Albertville; Moutiers; St.-Jean-de-Maurienne.	
Savoie (Haute-)	Annecy	4. Annecy; Bonneville; St. Julien; Thonon.	
Seine	Paris	3. Paris; St. Denis; Sceaux	Ile-de-France.
Seine-et-Marne	Melun	5. Melun; Coulommiers; Fontainebleau; Meaux; Provins	Ile-de-France (Gâtinais, Brie); Champagne.
Seine-et-Oise	Versailles	6. Versailles; Corbeil; Etampes; Mantes; Pontoise; Rambouillet	Ile-de-France (Hurepoix, Mantais, Vexin Gâtinais).
Seine-Inférieure	Rouen	5. Rouen; Dieppe; Le Havre; Neufchâtel; Yvetot.	Haute-Normandie (Roumois, Caux, Bray).
Sèvres (Deux)	Niort	4. Niort; Bressuire; Melle; Parthenay	Haut-Poitou.
Somme	Amiens	5. Amiens; Abbeville; Doullens; Montdidier; Péronne	Picardie.

Departments.	Capital Towns.	Arrondissements.	Ancient Provinces.
Tarn	Alby	4. Alby; Castres; Gaillac; Lavaur	Haut-Languedoc (Albigeois).
Tarn-et-Garonne	Montauban	3. Montauban; Castel-Sarrasin; Moissac	Guyenne; Gascogne; Languedoc.
Var	Draguignan	3. Draguignan; Brignoles; Toulon	Basse-Provence.
Vaucluse	Avignon	4. Avignon; Apt; Carpentras; Orange	Comtat; Haute-Provence.
Vendée	La Roche-sur-Yon	3. La Roche-sur-Yon; Fontenay-le-Comte; Les Sables-d'Olonne	Bas-Poitou.
Vienne	Poitiers	5. Poitiers; Châtellerault; Civray; Loudun; Montmorillon	Haut-Poitou.
Vienne (Haute-)	Limoges	4. Limoges; Bellac; Rochechouart; St. Yrieix	Haut-Limousin; Basse-Marche.
Vosges	Épinal	5. Épinal; Mirecourt; Neuchâteau; Remiremont; St. Dié	Lorraine (Vosges).
Yonne	Auxerre	5. Auxerre; Avallon; Joigny; Sens; Tonnerre	Bourgogne (Auxerrois); Champagne (Sénonais).
Corse	Ajaccio	5. Ajaccio; Bastia; Calvi; Corte; Sartène	Corse.

Prior to 1790 France was divided into thirty-two great and eight small military governments, often called provinces, which are, however, to be distinguished from the provinces formed under the feudal system. The great governments were—Alsace, Angoumois, Anjou, Artois, Aunis and Saintonge, Auvergne, Béarn and Navarre, Berri, Bourbonnais, Bourgogne (Burgundy), Bretagne (Brittany), Champagne, Dauphiné, Flandres, Foix, Franche-Comté, Guyenne and Gascogne (Gascony), Ile-de-France, Languedoc, Limousin, Lorraine, Lyonnais, Maine, Marche, Nivernais, Normandie, Orléanais, Picardie, Poitou, Provence, Roussillon, and Touraine. The eight small governments were—Paris, Boulogne and Boulonnais, Le Havre, Sedan, Toulois, Pays Messin and Verdunois, Saumurois, and Corse. See Plate XIII.

President. and every third year are partly renewed. The president of the republic is chosen for seven years by the senate and chamber of deputies voting together. He promulgates the laws passed by the parliament; he has the command of the land and sea forces, but cannot declare war without the advice of the chambers; he makes treaties of peace, alliance, and commerce, nominates to all Government offices, and has power to dissolve the chamber of deputies, with the sanction of the senate. He receives a yearly salary of 600,000 francs, with an allowance of 162,400 francs for household expenses. Senators and deputies have an allowance of 9000 francs each per annum. It may here be interesting to compare the salary now paid to the president of the republic with the civil list or revenue of the various dynasties which have successively ruled France since the beginning of the century. Louis XVIII. had 15,510,000 francs per annum, and 4,000,000 were allowed to the royal family. Charles X. got 25,000,000 for himself and 7,000,000 for the princes. Louis Philippe was satisfied with 12,000,000 francs a year, and adequate allowances to his children. And lastly, the second empire cost 25,000,000 francs a year, not including the pensions to the members of the imperial family, the revenues of the palaces, castles, and forests, and those mysterious resources which have become known by the name of *virements*.

Civil list.

Council of state. Next to these three great powers must be mentioned the council of state, presided over by the minister of justice, and composed of a vice-president, 22 councillors in ordinary service, 15 councillors in extraordinary service, representing the different ministers, 24 *maîtres des requêtes*, 20 auditors of first class, 10 auditors of second class, a general secretary having the title and rank of a *maître des requêtes*, and a *secrétaire du contentieux*. The auditors are appointed after a competitive examination; the councillors in ordinary service are elected by the chamber, and the other members of the council of state are nominated by the president of the republic. The business of the council is to give its advice on the projects of law which the parliament or the Government wish to submit to it, and on administrative regulations and by-laws. All disputes arising in matters of administration, and all claims or complaints against administrative officials, are brought before the council of state, whose decision is final. The vice-president receives a salary of 25,000 francs, the presidents of sections or committees 18,000 francs, the councillors 16,000, the *maîtres des requêtes* 8000 francs, and the auditors of first class 4000 francs; auditors of second class have no remuneration.

Ministers. The executive department of the Government is administered by the president of the republic and his cabinet council, consisting of nine ministers, viz.:—the minister of justice and keeper of the seals; the minister of foreign affairs; the minister of the interior; the minister of finance; the minister of war; the minister of marine and colonies; the minister of public instruction, ecclesiastical affairs, and the fine arts; the minister of agriculture and commerce; and the minister of public works. They are appointed by the president of the republic, and are reponsible to the chamber. They receive a salary which has been reduced from 100,000 to 60,000 francs, and may live, if they choose, in the "hôtels" where the duties of their ministry are discharged.

Administrative divisions. Administratively, France is divided into 87 departments cut rather arbitrarily out of the territory of the ancient provinces. These departments are subdivided into 362 "arrondissements," 2865 "cantons," and about 36,000 "communes." The table on pages 449–50 contains a list of the departments, with their capital towns and arrondissements, and also a reference to the old division into provinces.

Departmental administration. Each department is administered by a prefect appointed by the president of the republic, and each arrondissement by a sub-prefect. The prefects are divided into three classes, the salary being 35,000 francs for the first class, 24,000 for the second class, and 18,000 for the third class. The prefect of the Seine has 50,000 francs a year. The authority of each prefect is great in his own department: he can issue local decrees; he appoints and dismisses a number of agents who depend directly on him; he is at the head of the police to maintain public order, and for this purpose can summon the military forces; he superintends the collection of taxes; he is in correspondence with all the subordinate functionaries in his department, to whom he transmits the orders and instructions of the ministers; in one word, he is the general agent of Government, and the principal instrument of centralization in the state. He is assisted in his work by two bodies, the general council (*conseil général*), which is elected by universal suffrage, and the council of prefecture, which is nominated by the head of the executive power. The business of the council of prefecture is to decide all legal questions and to advise the prefect, when asked to do so. The general councils assess the taxes, authorize the purchase, sale, or exchange of departmental property, superintend the management of the same, decide about new roads, railways, or canals, vote the budget for sanitary and charitable institutions belonging to the department, and give advice on every matter of local interest, political questions being strictly excluded. The law of the 23d February, 1872, however, has invested them with great political importance; in case of the parliament being violently dissolved by a *coup d'état*, they must immediately assemble, and form a new parliament with their delegates, in order to oppose by all means the criminal attempt.

Arrondissement As the prefect in the department, so the sub-prefect, with a more limited authority, is the representative of the central power in the arrondissement. He is assisted, and to a certain extent controlled, in his work by the council of arrondissement—an elective body to which each canton of the arrondissement sends one member. Except in that case, the canton is not an administrative division. It will be noticed again in connection with the judicial system of the country.

Commune. The commune is the administrative unit in France. At its head is a mayor assisted by deputy-mayors (*adjoints*), the number of whom varies according to the population; communes of 2500 inhabitants have one deputy-mayor; up to 10,000 inhabitants they have two, from 10,000 to 30,000 three, and one additional for every 20,000. The mayor has a double part to perform, as he represents both the central power and the commune; and often it is a difficult matter to avoid a conflict of duties. He is besides *officier de l'état civil*, or official registrar of births, marriages, and deaths. The mayor and deputy-

mayor are not salaried officials. In the large towns they are nominated by Government, but they must always be chosen out of the municipal council, which is elected on the principle of universal suffrage, and has with regard to the commune much the same power and duties as the general council with regard to the department.

Every canton must have a commissary of police, who is under the direct control of the mayor. This police-officer is appointed by the prefect in towns having not more than 6000 inhabitants, and by the president of the republic in the others. He has rather complex duties, being at the same time a governmental, judicial, and municipal agent.

Paris and Lyons have in some respects a special and exceptional administration, the consideration of which belongs to the articles devoted to these cities.

IV. *Law and Administration of Justice.*

Judicial proceedings may be classed under civil, commercial, and criminal jurisdictions; there are besides some special departments, such as military and maritime tribunals, councils of discipline, and the *cour des comptes*.

Juge de paix.

In civil matters, every canton has a *juge de paix*, whose decision is final when the amount in dispute does not exceed 100 francs (£4); up to 200 francs, he only can give a sentence subject to appeal. His principal business is, however, one of conciliation; and no suit can be brought before the tribunal of first instance till he has endeavored without success to bring the parties to agreement.

Primary and appeal courts.

A tribunal of first instance, or primary court, is established in every arrondissement. Its decision may be appealed against for sums above 1500 francs. The *cours d'appel* decide the actions when the sentence of the first court has been appealed from. They are 26 in number, established in the following towns:—

Cours d'Appel.	Departments depending on them.
PARIS	Seine, Aube, Eure-et-Loir, Marne, Seine-et-Marne, Seine-et-Oise, Yonne.
AGEN	Gers, Lot, Lot-et-Garonne.
AIX	Basses-Alpes, Alpes-Maritimes, Bouches-du-Rhône, Var.
AMIENS	Aisne, Oise, Somme.
ANGERS	Maine-et-Loire, Mayenne, Sarthe.
BASTIA	Corse.
BESANÇON	Doubs, Jura, Haute-Saône, Belfort.
BORDEAUX	Charente, Dordogne, Gironde.
BOURGES	Cher, Indre, Nièvre.
CAEN	Calvados, Manche, Orne.
CHAMBÉRY	Savoie, Haute-Savoie.
DIJON	Côte-d'Or, Haute-Marne, Saône-et-Loire.
DOUAI	Nord, Pas-de-Calais.
GRENOBLE	Hautes-Alpes, Drôme, Isère.
LIMOGES	Corrèze, Creuse, Haute-Vienne.
LYONS	Ain, Loire, Rhône.
MONTPELLIER	Aude, Aveyron, Hérault, Pyrénées-Orientales.
NANCY	Meurthe-et-Moselle, Meuse, Vosges, Ardennes.
NÎMES	Ardèche, Gard, Lozère, Vaucluse.
ORLÉANS	Indre-et-Loire, Loir-et Cher, Loiret.
PAU	Landes, Basses-Pyrénées, Hautes-Pyrénées.
POITIERS	Charente-Inférieure, Deux-Sèvres, Vendée, Vienne.
RENNES	Côtes-du-Nord, Finistère, Ille-et-Vilaine, Loire-Inférieure, Morbihan.
RIOM	Allier, Cantal, Haute-Loire, Puy-de-Dôme.
ROUEN	Eure, Seine-Inférieure.
TOULOUSE	Ariége, Haute-Garonne, Tarn, Tarn-et-Garonne.

Tribunals of commerce.

Tribunals of commerce to decide disputed points arising out of business transactions are instituted in all the more important commercial towns, and consist of judges chosen from among the leading merchants, and elected by their fellows. For sums above 1500 francs there can be appeal from their decision. In small towns, the judges of the civil tribunal decide such commercial cases.

Criminal courts.

The courts of criminal jurisdiction are of three kinds. The tribunals of ordinary police (that is, the justice of the peace court in each canton) have the cognizance of small offences, which are punishable by a fine not exceeding 15 francs (12s.), or by imprisonment not exceeding 5 days. Offences of a more serious character, which French law calls *délits*, are judged by a special section of the tribunals of first instance, bearing the name of *tribunal correctionnel*. This tribunal can be appealed to from the sentences pronounced by tribunals of police; but its judgments are also subject to the revision of the *cours d'appel*. Offences which rank as crimes are judged by the *cour d'assises*, consisting of three magistrates and twelve jurors. The jury, as in England, decides only on the facts of the case, leaving the application of the law to the judges. The assizes are the only courts that are not stationary. They are held in the chief towns of the departments once in three months. In all criminal suits, the first inquiry is confided to a special magistrate attached to the tribunal, called *juge d'instruction*. He conducts the necessary investigations privately and with almost absolute power. An order of *non-lieu* issued by this magistrate at once puts an end to any prosecution. But if he finds that the case should go to trial, he hands it over to the court, before which a public prosecutor, with the title of *procureur*, or *procureur-général de la république*, maintains and endeavors to prove the accusation.

Court of cassation.

Above these various tribunals the court of cassation stands supreme. It is held at Paris, and is composed of three chambers, the *chambre des requêtes*, the *chambre civile*, and the *chambre criminelle*. Its province is to decide in all appeals from the other courts, investigating, not the facts of the case, but the forms of law, and ordering, wherever these have been infringed or deviated from, a new trial before such other tribunal as it thinks fit.

Special courts.

Among the special jurisdictions may be mentioned the military tribunals or councils of war, which sit in judgment on crimes and offences committed by soldiers, or by civilians in a town or district proclaimed by the Government as in a state of siege; the maritime tribunals, which are to the navy what the councils of war are to the land forces; and the councils of discipline for lawyers and other professional corporations. The *cour des comptes* deserves special notice. It consists of three chambers, with a president in chief over the whole court, and three presidents (one for each chamber), a general procurator, a chief *greffier*, 102 councillors, 20 auditors, and 81 clerks. This important institution, which costs 1,554,500 francs a year, was created in 1807 in order to control all the accounts of the Government officials. Certain agents who are not magistrates are, however, connected with the administration of justice. Such are the *greffiers* (clerks of the court), who keep the archives, and receive a salary from the Government; the *huissers* (sheriff-officers), who give notice of summonses and sentences; and the *avoués* (solicitors) and the public notaries (*notaires*).

Statistics of justice (1874.)

Statistics of Justice (1874).—In 1874 the *juges de paix* had before their bar, with a view to private settlement, a total of 2,160,116 cases, and brought the parties to an agreement in 856,340, a result which is hardly satisfactory. As judges they had on their rolls 391,129 cases, to which 5166 electorial disputes must be added. Their decisions were appealed from in 4460 cases. There were 125,248 cases on the rolls of the civil tribunals of first instance. The commercial courts had 255,333 cases before them, 5596 of which were cases of failure or bankruptcy. In 1850 the number was only 138,027. The decisions of the various courts above mentioned were followed by 10,555 appeals, which were brought before the *cours d'appel*. In about 67 per cent. of these the original sentences were confirmed. Of offences 168,835 were brought under the consideration of the *tribunaux correctionnels*, 171,431 males, and 31,678 females being implicated in them. Of these 7509 were under sixteen years of age, and 146,588 above twenty-one. The tribunals acquitted 13,506. Out of 7949 appeals the *cours d'appel* confirmed about three-fourths of the original sentences, and in 1206 cases increased the punishment awarded by the *tribunaux correctionnels*. The jury and judges of assize courts tried 4084 cases, affecting 5228 prisoners, 4368 being males and 860 females; 55 were under sixteen years of age, 799 under twenty-one, and 284 above sixty; 2818 were unmarried; and nearly the half of the number consisted of people living in towns; 170 only had received a good education; 1810 could not read, and 2160 could read and write but imperfectly. The jurors found 1056 prisoners not guilty; 31 were condemned to death, 151 to hard labor for life, 972 to hard labor for a limited time, 1 to transportation; 29, who were under 16 years of age, were sent to houses of correction; sentences of imprisonment for various periods were passed on the others, except two, who were fined. Four women were among the prisoners condemned to death; the sentence was carried out in the case of 13 of the convicts; the others, including one of the women, had their sentences commuted. Besides these criminal cases, the *cours d'assise* had to decide on 20 alleged infringements of the laws and regulations affecting the liberty of the press, and on 10 political offences, consisting

of speeches, cries, or displaying of emblems considered as seditious. The accused were 52 in number, of whom 28 were acquitted, 4 fined, and 20 sent to prison. There were 1100 criminal cases brought before the *cour de cassation*, which has the same jurisdiction in criminal matters as in civil. In a large majority of cases it confirmed the decrees of the tribunals, only 103 having been sent back for a new trial.

Prisons.

Prisons.—Although the prisons are attached to the ministry of the interior, it is impossible to treat of the administration of justice without saying a word about them. The convicts who have to serve more than one year are distributed into 24 central prisons (*maisons centrales*). Departmental prisons receive those whose sentence does not exceed one year. Political convicts are kept in custody in the two *maisons de détention* of Doullens (Somme) and Belle-Ile (Morbihan). Two places of transportation, Cayenne and New Caledonia, receive those who were formerly confined in *bagnes*, or convict prisons. The population of these penal colonies is considerably increased by the victims of internal discord; for in France it seems as if the victorious party thought that by banishing its opponents from their native land it could eradicate the ideas for which they unsuccessfully fought. The expenses of these different penitentiary establishments amount to about 18,500,000 francs. On the other hand, the produce of prison labor has a value of 2,800,000 francs.

Police.

Police.—The public peace is maintained by an armed police or *gendarmerie*, partly on foot and partly mounted; and in all emergencies, when this force is found insufficient for the preservation or execution of the laws, the troops may be called in to assist, subject, however, to the orders of the police. About 7000 *gardiens de la paix*, formerly *sergents de ville* (policemen), under the orders of the prefect of police, form in Paris an additional police force; and similar organizations exist in all the larger towns.

V. *Religion.*

Three churches are recognized and supported by the state in France,—the Roman Catholic, the Protestant (subdivided into Calvinist and Lutheran), and the Hebrew. In Algeria the Mussulman creed is equally recognized.

Roman Catholics.

Roman Catholic.—The Roman Catholic Church is much stronger than the others. It may perhaps be said that France is the country where this church is the most powerful; at any rate, it has there its most perfect organization, and raises the largest sums of money; and it is to France that, directly or indirectly, the Holy See appeals in all its difficulties. Most of the provisions of the "concordat" concluded in 1801 between the first consul Bonaparte and Pope Pius VII. are still in force. France is divided into dioceses, each governed by an archbishop or a bishop, and the dioceses into parishes, each of which has at its head a *curé*, or parish priest. Archbishops and bishops are appointed by the head of the Government and confirmed by the pope; the archbishop of Paris receives a salary of 50,000 francs, and the others are paid 20,000 francs a year. The stipend of the bishops is 15,000 francs per annum. In 1789 France contained 135 dioceses, 18 of which were archbishoprics. The Constituent Assembly made the dioceses correspond exactly with the departments; but this was changed by the concordat of 1815. The archbishoprics and bishoprics now existing in France are as follows:—

Archbishoprics.	Bishoprics.
Paris	Chartres, Meaux, Orléans, Blois, Versailles.
Aix, Arles, and Embrun	Marseilles, Fréjus and Toulon, Digne, Gap, Nice, Ajaccio.
Albi	Rodez, Cahors, Mende, Perpignan.
Auch	Aire and Dax, Tarbes, Bayonne.
Avignon	Nîmes, Valence, Viviers, Montpellier.
Besançon	Verdun, Belley, St. Dié, Nancy.
Bordeaux	Agen, Angoulême, Poitiers, Périgueux, La Rochelle, Luçon.
Bourges	Clermont, Limoges, Le Puy, Tulle, St. Flour.
Cambrai	Arras.
Chambéry	Annecy, Tarentaise, Maurienne.
Lyons and Vienne	Autun, Langres, Dijon, St. Claude, Grenoble.
Rheims	Soissons, Châlons-sur-Marne, Beauvais, Amiens.
Rennes	Quimper, Vannes, St. Brieuc.
Rouen	Bayeux, Evreux, Sées, Coutances.
Sens and Auxerre	Troyes, Nevers, Moulins.
Toulouse and Narbonne	Montauban, Pamiers, Carcassonne.
Tours	Le Mans, Angers, Nantes, Laval.

Every archbishop has three vicars-general, and every bishop two, making a total of 190. They are assisted by a chapter attached to each cathedral church, and presided over by the bishop. The *curés* have a minimum salary which varies from 1500 to 1200 francs, but additional money may be allowed by the municipal councils. They also receive the fees charged for baptisms, marriages, funerals, and extra masses, and have the benefit of a free house called a *presbytère*. The *curés* are about 3500 in number, and are assisted by curates (*vicaires*), and by *desservants*, the latter being priests attached to *succursales* or chapels-of-ease in large parishes. In 1873 the sums paid to the prelates and priests of France by the Government amounted to 39,382,495 francs—about two and a half millions more than in 1859.

The Roman Catholic Church possesses in France 89 *grands séminaires*, in which special instruction is given to young men who intend to enter the church, and 150 *petits séminaires*, or establishments of secondary education, by which the clergy endeavor to rival the *lycées* of Government. There are besides a number of schools and colleges kept by the Jesuits and other religious bodies. A recent law has even allowed the clergy to found independent universities, which will be noticed in the chapter on education. Convents are very numerous in France, especially for females. They are inhabited by about 140,000 persons (including 120,000 women), whose property is worth more than a thousand millions of francs.

Protestants.

Protestants.—The *Église Réformée* (Calvinist Church) has about one million of members in France, distributed into parishes, which form 103 consistories, and 21 synodal districts, including Algeria. The Lutheran Church (*Église de la Confession d'Augsbourg*) is far inferior in number. It is ruled by a directory, now sitting in Paris, instead of Strasburg as formerly. Sixty-one pastors compose the staff of this Church, whilst the Calvinist Church has 600. The seminary of the latter is at Montauban, and that of the former at Paris since the loss of Strasburg.

Jews.

Jews.—The Hebrew Church is administered by a central consistory presided over by the chief rabbi. It is subdivided into eight provincial consistories, sitting respectively at Paris, Lyons, Bordeaux, Nancy, Marseilles, Bayonne, Lille, and Vesoul. Their seminary used to be at Metz, but has been transferred to Paris.

VI. *Education.*

Ministry of instruction.

The National Convention laid the foundation of the system of public instruction that is still in force in France; the Government of the first Napoleon developed and completed it. At the head of public instruction is a minister, who has the title of grand-master of the university, this term describing not an institution for liberal education as in Great Britain and Germany, but the branch of administration under which public instruction in its universality is placed. The minister appoints all the officers of university administration, and fills up all the vacancies in colleges and schools. He is assisted by the superior council of public instruction, which has to examine the books adopted in schools and colleges, to judge and remove incompetent teachers,—in short, to watch over the concerns and interests of public instruction in all its branches. Attached to this council are 19 inspectors-general, who visit the principal establishments in the country for the purpose of inquiring into their management and the way in which instruction is conducted.

Academies.

Académies.—The whole territory of France is divided into 16 *académies*, or districts of educational jurisdiction, a list of which is appended.

Académies.	Departments included in them.
Paris	Seine, Cher, Eure-et-Loir, Loir-et-Cher, Loiret, Marne, Oise, Seine-et-Marne, Seine-et-Oise.
Aix	Bouches-du-Rhône, Basses-Alpes, Alpes-Maritimes, Corse, Var, Vaucluse.
Besançon	Doubs, Jura, Haute-Saône.
Bordeaux	Gironde, Dordogne, Landes, Lot-et-Garonne, Basses-Pyrénées.
Caen	Calvados, Eure, Manche, Orne, Sarthe, Seine-Inférieure.

Chambéry	Savoie, Haute-Savoie.
Clermont-Ferrand	Puy-de-Dôme, Allier, Cantal, Corrèze, Creuse, Haute-Loire.
Dijon	Côte-d'Or, Aube, Haute-Marne, Nièvre, Yonne.
Douai	Nord, Aisne, Ardennes, Pas-de-Calais, Somme.
Grenoble	Isère, Hautes-Alpes, Ardèche, Drôme.
Lyons	Rhône, Ain, Loire, Saône-et-Loire.
Montpellier	Hérault,, Aude, Gard, Lozère, Pyrénées-Orientales.
Nancy	Meurthe-et-Moselle, Meuse, Vosges.
Poitiers	Vienne, Charente, Charente-Inférieure, Indre, Indre-et-Loire, Deux-Sèvres, Vendée, Haute-Vienne.
Rennes	Ille-et-Vilaine, Côtes-du-Nord, Finistère, Loire-Inférieure, Maine-et-Loire, Mayenne, Morbihan.
Toulouse	Haute-Garonne, Ariége, Aveyron, Gers, Lot, Hautes-Pyrénées, Tarn, Tarn-et-Garonne.

At the head of each *académie* is a rector, assisted by an academical council, and by the inspectors of the district. His business is to superintend all the schools, colleges, and faculties within the bounds of his educational province, and to serve as the organ of communication between the inferior officials and the minister of public instruction. In the *académie* of Paris the rector is the minister himself, who is represented by a vice-rector. The rectors have not, however, the entire management of all educational matters, for primary schools are mostly under the superintendence of the perfect and of a departmental council.

Higher education.

Superior education is given by faculties of theology, law, medicine, sciences, and literature. The faculties of theology are established at Paris, Aix, Bordeaux, Lyons, Rouen, Montauban; those of law at Paris, Toulouse, Aix, Caen, Dijon, Poitiers, Rheims, Bordeaux, Grenoble, Douai, Nancy; those of medicine at Paris, Montpellier, Nancy; those of sciences at Paris, Besançon, Rennes, Caen, Bordeaux, Clermont, Poitiers, Dijon, Grenoble, Lille, Nancy, Lyons, Marseilles, Montpellier, Toulouse; and those of literature at Paris, Aix, Besançon, Bordeaux, Caen, Clermont, Dijon, Douai, Grenoble, Lyons, Montpellier, Poitiers, Rennes, Toulouse, Nancy. The faculties not only impart superior teaching, but are also examining bodies, which confer the degrees of bachelor, licentiate, and doctor.

The teaching work of the faculties is in some measure shared by 3 superior schools of pharmacy established in the same towns as the faculties of medicine, 22 preparatory schools of medicine and pharmacy, 5 preparatory schools of science and literature (at Angers, Lyons, Nantes, Chambéry, Rouen), and by the *École pratique des Hautes Études*, founded in 1868 at Paris.

Secondary education.

Secondary education is given in 80 *lycées*, attended by about 37,000 pupils, and 244 *colléges communaux*, with an attendance which is not much inferior in number to that of the *lycées;* but the organization of many of them is still in an imperfect state.

Primary schools.

The third and lowest stage of national instruction is that of the *écoles primaires* or primary schools. Every commune of 500 inhabitants has to maintain a boys' and a girls' school. The law is not yet very strictly observed; in 1871 the total number of schools was 51,881, of which 20,374 were boys' schools, 14,837 schools for girls, and 16,670 schools attended by girls and boys together. Primary instruction steadily gains ground in France, although it is neither gratuitous—except when parents cannot pay for it—nor obligatory by law. In 1827 only 420 out of 1000 could read; in 1857 this average had risen to 675, and in 1867 to 775. The following table was published in 1873 by the general bureau of statistics:—

Age.	Can neither write nor read.	Can read.	Can read and write.	Instruction not ascertained.	Total.
Under 6 years.....	3,540,101	292,348	151,595	38,042	4,022,086
From 6 to 20 years	2,082,338	1,175,125	5,458,097	70,721	8,786,281
Above 20 years...	7,702,362	2,305,130	13,073,057	214,005	23,294,554
	13,324,801	3,772,603	18,682,749	322,768	36,102,921

Training schools

To provide the staff of teachers necessary for these educational establishments, training schools (*écoles normales*) have been instituted. The *écoles normales primaires* are now 90 in number,—79 for the training of male and 11 for the training of female teachers. The *école normale supérieure*, founded by the decree of the 9th Brumaire, year III. (30th October, 1794), provides for the education of professors for the *lycées* or *facultés;* it maintains 100 students, who, during a course of three years, not only attain considerable proficiency in literature and science, but are trained to the art of communicating their knowledge to others in an attractive and interesting form. It is not, however, necessary to have gone through the course of study of the *école normale* to become a secondary teacher or a faculty professor; the condition required of students of the *école normale*, as of others, is to pass a series of examinations, and to acquire the degrees of *bachelier*, *licencié*, and *agrégé*, the last being the only one conferring rights of membership in the university.

The law of the 21st June, 1865, has laid down in the lycées and communal colleges a special course of teaching, more especially intended to prepare pupils for commercial and industrial pursuits; it is called *enseignement secondaire spécial*. A normal school, for the training of teachers who choose this line, was founded at Cluny (Saône-et-Loire) in 1868.

Private and special schools.

Private Educational Establishments.—The systematic provision thus made by the state for public instruction in France is supplemented in various ways. Not only may any one who possesses the diploma of bachelor engage in the work of primary and secondary education on his own account, but recently by a special law sanction has been given to the existence of institutions for superior instruction distinct from those of the state. The Roman Catholic clergy have not been slow to take advantage of this new state of things, and have established universities in which students may get their degrees, as in the old university of France. In 1872 there were, besides the governmental schools, 657 establishments for secondary education directed by laymen, and 278 by priests, the latter giving instruction to 34,000 pupils, whilst the 657 others were only attended by 43,000. There are other high class schools devoted to various special purposes, and not in all cases depending on the minister of public instruction. Such are the *École des chartes*, in which twenty students are trained during a three years' course to study the documents and historical remains of the Middle Ages; the *École des langues orientales;* the *École des beaux-arts*, which every year sends to Rome its best pupil in each of the departments of painting, sculpture, and architecture; the *École de Rome et Athènes*, where young *savants* find the opportunity of studying antiquities in the two great capitals of the ancient world; several special schools for the teaching of drawing and mathematics applied to the industrial arts at Paris, Lyons, and Dijon; the *École polytechnique*, in which the highest scientific education is imparted to young men who have passed a very difficult preliminary examination, and who wish to prepare themselves for the ordnance office, for engineering, or for high positions in the different branches of administration; the *École spéciale militaire*, established at St. Cyr for officers; the *École de cavalerie*, at Saumur; the *Prytanée militaire*, at La Flèche, in which gratuitious instruction is given to sons of officers, and non-commissioned officers; the *École d'application d'état-major*, for the training of staff officers; the *École d'application de l'artillerie et du génie*, at Fontainebleau, formerly at Metz, where old students of the polytechnic school receive a more special and developed instruction; the naval school at Brest; the *École d'application du génie maritime*, for students of the polytechnic school who are intended for maritime engineering; the *École d'hydrographie*, for sea-captains; the *École des ponts et chaussées*, which is under the minister of public works and prepares the old students of the polytechnic school for civil engineering; the *École des mines*, towards which a stage in the polytechnic school is also a first and necessary step; the *Conservatoire des arts et métiers*, under the control of the minister of agriculture and commerce; the *École centrale des arts et manufactures*, for the training of private engineers and manufacturers; the schools of *arts et métiers*, established at Châlons-sur-Marne, Angers, and Aix; the *École forestière*, at Nancy, which trains the administrators of the forests belonging to the state and to the communes; the agricultural schools of Grignon (Seine-et-Oise), Grandjouan (Loire-Inférieure), and Montpellier (Hérault); the veterinary schools of Alfort (Seine), Toulouse, and Lyons; the *Maisons d'éducation de la légion d'honneur* at St. Denis, Ecouen, and Les Loges, for daughters of knights of the Legion of Honor in straitened circumstances.

Notice must also be taken of the *Collége de France*, in which 34 professors deliver lectures to the public on almost every branch of human knowledge; the *Muséum d'histoire naturelle*, with 16 lecturers; and the chair of archæology attached to the national library of Paris. Government supports three

great establishments devoted to astronomical study—the *Bureau des Longitudes* and the observatories of Paris and Marseilles.

The Institute.

The highest institution founded and kept up by the French Government on behalf of science and literature is the *Institut de France*, composed of five Academies as follows:—

Academies.	Sections.	Members.	Honorary Members.	Foreign Members.
Académie Française	...	40	...	...
Académie des Inscriptions et Belles-lettres	11	40	10	8
Académie des Sciences	11	63	10	8
Académie des Beaux-Arts	5	40	10	10
Académie des Sciences morales et politiques	6	40	5	5

The *Académie de Médecine* is a separate body, divided into 11 sections; it is composed of 100 resident members, and a number of fellows and correspondents, chosen from among the medical celebrities of the world.

VII. *Charitable Institutions.*

Although there is no poor law in France, charitable establishments, either private or created and managed by the state, are very numerous, and, on the whole, efficient. *Orphelinats* (orphans' houses) receive infants which have neither parents nor friends to care for them; *crèches* and *salles d'asile* (infant schools) gratuitously give shelter and the first elements of education to poor children whose mothers must earn their daily bread by out-door work; young girls of the destitute class may learn a trade in the *ouvroirs* or workshops freely open to them in many towns; whilst lads find employment and agricultural training in such establishments as the *colonies agricoles* of Mesnil-St.-Firmin (Oise), St. Jean, Petit-Mettray (Somme), Lesparre (Gironde), Montmorillon (Vienne), etc. There are also other charitable institutions, analogous to those which exist in other countries. Besides these private charities, more or less supported by Government grants, there is a special department, called *assistance publique*, a branch of the minister of the interior, established to superintend, and in some cases organize, the *bureaux de bienfaisance* and hospitals. The *bureaux de bienfaisance* give out-door relief to the poor when it is deemed necessary. They are 12,989 in number, or about 36 *bureaux* for every 100 communes, a proportion quite inadequate—there should be one for each commune.

In 1873 these bureaux assisted 1,312,847 people, or an average of 3·61 per cent.; but this help is still very unequally distributed, the average being 18 per 100 in the department of the North, and under 0·35 per 100 in the departments of Corsica, Ardèche, and Pyrénées-Orientales. The total amount of their disbursements, covered by foundations, grants, a tax on the theatres, and private gifts, is about 12,500,000 francs, which gives an average of less than 17 francs (13s. 8d.) for each pauper assisted. The same inequality appears here; for, whilst in the department of the Seine the average is 26·95 francs (£1, 1s. 7d.) per head, it falls as low as 6·45 francs (5s. 2d.) in less favored districts.

Hospitals.

The number of hospitals, in addition to the *Maison Municipale de Santé* and the seven great establishments of Paris, is 1481, furnished with 161,520 beds, and employing 2673 physicians and surgeons, 3212 officials, 11,032 nuns, and 11,534 servants. In 1873 the number of patients received was 410,441,—that is, 1 patient for 88 inhabitants. Out of 100 patients, 79 were discharged cured, at least for a time, and the death average was not above 9 per cent. Besides the patients who only pass through the wards (37 days is the average duration of their stay), 69,786 infirm, incurable, or old people live as inmates in some of the hospitals, which are specially designated by the name *hospice;* this number is divided into 27,256 men, 31,037 women, and 11,493 children. This population of invalids, both in *hôpitals* and *hospices*, was maintained at a cost of 93,269,886 francs.

It must be confessed that all these means of relief, good as they are, provide but very insufficiently for the wants of the million of poor which France reckons among her 36 millions of inhabitants. Pauperism is, there as elsewhere, a sore which civilization has been as yet quite unable to heal.

Lunatic asylums.

The census of 1872 shows that there were at that time 87,968 lunatics in France, an average of 2·44 for 1000 inhabitants. Of these 51,004 were kept at home, and 36,964 in asylums, public or private. In 1873 the number of asylums in France was 102, of which 61 were public; of the 41 private asylums 17 received the poor gratuitously. These asylums, at the end of the year, contained 41,064 inmates, of whom only about 8000 were able to pay for board and attendance; the rest were paupers. The average number of cures was 6 per cent., and of these part only would be permanent.

VIII. *Finance.*

Ministry of finance.

All the agents who have the charge of collecting taxes are under the minister of finance, who, besides, distributes to the other departments the sums necessary for their expenses. In each department a *trésorier payeur général* receives the taxes raised in his district, and is accountable for them to the central office of the treasury at Paris. These *trésoriers payeurs généraux* have a salary of 6000 francs a year, but they also get a percentage on the amount of taxes collected, and are allowed to transact private banking business with the funds of the state, as well as with their own. As security they have, before entering on their duties, to deposit with the treasury a sum which varies with the importance of their situation, but on an average amounts to 800,000 francs. A part of their business is to pay the creditors of the state in their respective departments. They are assisted in their work by *receveurs particuliers* in each arrondissement, except that in which the *trésorier payeur général* resides. These officials have a salary of 2400 francs a year, and a percentage on the amount that they collect. The security which they are bound to give is five times their total income.

Direct taxes.

The taxes that pass through the hands first of the *receveurs particuliers*, then of the *trésoriers payeurs généraux*, and finally into the treasury, are of two kinds, direct and indirect. The land tax, the poll and rent-tax, the tax on doors and windows, the license tax, and the tax on money invested in public funds or in bonds of private companies (*valeurs mobilières*) are now the chief sources of the direct revenue of the French treasury. The land-tax or *contribution foncière* is assessed on the net revenue of landed property. In order to obtain as correct a valuation as possible, a land register book was commenced in 1821, in which every piece of ground has to be described, with its extent and value, and the name of the owner. This work is not yet quite completed, and the continual changes which occur in the ownership of holdings, as well as in value or size, will always prevent it from being perfect. As it is, this gives the average net revenue of assessed land in France as amounting to 1,053,907,113 francs 56 centimes. In 1874 this yielded to the treasury a revenue of 169,905,814 francs. Each citizen owes to the state the value of three days' work; this is the *contribution personnelle* (poll tax). The value of a day's work varies with the districts; but it cannot exceed 1 franc 50 centimes (1s. 2½d.) or be less than 50 centimes (5d.). Every proprietor or tenant, except paupers, soldiers in service, and foreign diplomatic or consular agents, is assessed in proportion to the rent of the house he lives in. This tax, which is collected along with the preceding one, is distinctively called *contribution mobilière*. In 1875 the *contribution personnelle mobilière* gave a return of about 56 millions of francs.

The tax on doors and windows rises in proportion to the population of the communes or towns, the average being 30 centimes (3d.) for one aperture in communes having under 5000 inhabitants, and 1 franc (10d.) in those of 100,000 inhabitants and upwards. In 1871 the 8,467,483 houses in France were divided thus:

Houses with one aperture	276,384
" two apertures	1,883,924
" three apertures	1,601,050
" four apertures	1,112,024
" five apertures	793,551
" six and upwards	2,800,550

The value of the assessment was 43,275,000 francs in 1875; but the enormous number of houses having only one door, and of those having two doors without a window, or one door and one window, tells strongly against the wisdom of such a tax.

The license tax is imposed on every person carrying on

any business whatever; physicians, bankers, and manufacturers are subject to this tax, as well as the humblest shopkeeper. On the 1st January, 1873, 1,529,363 names were on the rolls as *patentés*, and the amount produced by the tax was for the same year 73,726,331 francs.

A law of the 29th June, 1872, has established a tax of 3 per cent. on the income derived from money invested in the public funds and from bonds and shares in commercial or industrial companies. This tax, added to other duties previously established, as the stamp and the duty of *transmission*, raises to 7½ per cent. the charges that this kind of property has to bear.

Tax collectors.

These various taxes are collected by agents called *percepteurs*, under the orders of the *receveurs particuliers* or *trésoriers payeurs généraux*. Their number is 7000,—hardly enough for the amount and intricacy of the work they have to do. They are paid, not by a salary, but by a percentage on the money they raise. The collecting of other less important taxes, as the tax on mortmain, on mines, on weights and measures, on houses and carriages, on billiards and clubs, is also entrusted to them.

Excise.

The excise revenue, or *contributions indirectes*, is managed by a central office at Paris, with a *directeur général*, three *administrateurs*, and 94 other officials and clerks of various ranks. Each department has a *directeur*, assisted by *inspecteurs*, *sous-directeurs*, and *contrôleurs*. Under this head are comprised the taxes on intoxicating drinks, salt, tobacco, gunpowder, on public coaches and railways, on gold and silver work, on sugar, paper, matches, soap, stearine, salad oil, receipt stamps; also the navigation dues, bridge tolls, and a few other special taxes of little importance. The excise appears on the budget of 1877 for a sum of 1,039,293,800 francs. The taxes on paper, soap, stearine, oil, matches, etc., have been established in consequence of the war of 1870–71. A numerous staff is employed to collect these duties. Besides the high functionaries mentioned above and their clerks, there are 1795 *receveurs ambulants*, with 4637 *commis;* alcohol, matches, paper, salt, etc., require 218 officials; 200 are employed to collect the navigation tax; 2038 are attached to the manufactures of sugar, etc. The total number is above 19,000.

Customs.

For a long time the customs (*douane*) were only a branch of the administration of the *contributions indirectes*, but since 1869 they have formed a special office, at the head of which is a *directeur général*, with a salary of 25,000 francs, assisted by two *administrateurs* and 93 clerks. As far as this office is concerned, France is divided into 26 districts, administered by 26 *directeurs*, residing at Dunkirk, Lille, Valenciennes, Charleville, Nancy, Épinal, Besançon, Bourg, Lyons, Chambéry, Nice, Marseilles, Montpellier, Perpignan, Bayonne, Bordeaux, La Rochelle, Nantes, Vannes, Brest, St. Brieuc, Caen, Rouen, Le Havre, Boulogne, and Bastia. These directors have under them 81 inspectors, 71 sub-inspectors, and 130 clerks of all ranks. An armed force, composed of 245 captains, 469 lieutenants, 4056 non-commissioned officers, and 14,207 privates (*préposés*), is distributed along the frontiers to prevent smuggling; for the same purpose 1257 sailors, commanded by 371 *patrons* and *sous-patrons*, keep guard along the coasts. The customs contributed to the budget of 1877 a sum of 268,355,800 francs, and their collection cost 30,362,105 francs.

Other sources of revenue.

There are still other sources from which money flows into the treasury. The administration of the *enregistrement, timbre, et domaines* yielded 634,605,451 francs in 1877. This sum is made up—(1) by the fees charged for the registration of all legal documents and deeds; (2) by shooting and hunting licenses; (3) by the sale of stamps; (4) by the revenues and sales of state property; and (5) by fines of various sorts and the cost to the public of legal proceedings. From this amount 19,038,400 francs must be deducted, being the expenditure required to pay the expense of collection. The public forests and those managed by the state gave a return of 38,548,680 francs, and cost 12,995,732 francs. For all purposes connected with these taxes the country is divided into 32 districts, administered by as many *conservateurs*, whose residences are Paris, Rouen, Dijon, Nancy, Amiens, Troyes, Épinal, Châlons-sur-Marne, Besançon, Lons-le-Saulnier, Grenoble, Alençon, Bar-le-Duc, Macon, Toulouse, Tours, Bourges, Moulins, Pau, Rennes, Niort, Carcassonne Aix, Nîmes, Aurillac, Bordeaux, Ajaccio, Chaumont, Vesoul, Chambéry, Nice, and Valence. The post-office department employs about 32,000 officials, at a cost of about 71,500,000 francs, and yielded 116,126,000 francs in 1877. The telegraph service is under the minister of the interior. In 1872, 123,000 kilometres (76,430 miles) of wires were laid along distances of 44,965 kilometres (27,940 miles). In 1877 the total income from this source amounted to 16,600,000 francs. The income from other less important resources, which cannot here be noticed in detail, may be estimated at not much less than 2 millions of francs.

National debt.

The total income of the public treasury in France, including the revenues of the departments and communes, is above 3,000,000,000 francs (£120,000,000), which is more than any other nation has to pay for the expenses of its government; and yet this enormous sum has not been sufficient to meet the wants of the state, for repeated loans have constantly increased the public debt. Not taking into account the petty payments of all sorts that Government has always to make, the public debt is divided into funded (*dette consolidée*) and floating debt (*dette flottante*). The funded debt is not subject to reimbursement, but only to the payment of a certain interest fixed by law. This debt, which was arranged by the law of the 9th of Vendémiaire, year VI. (27th September, 1797), to liquidate the old debts of the monarchy, then amounted to 40,216,000 francs of interest to be paid yearly to the creditors. From 1800 to 1814 it increased by 23,091,635 francs; and the Government of the Restoration added 101,260,463 francs, making a total of 164,568,100 francs in interest. Louis Philippe carried it to 176,845,367 francs, and at the time of the *coup d'état* it amounted to 230,768,863 francs. The second empire, during a period of eighteen years, created 168,187,663 francs of consols, thus charging France with an annual payment of 398,956,526 francs. As an unavoidable consequence of the Prussian war, the funded debt has been still further increased, so that the interest was 748,593,642 francs in 1874, and 747,571,030 francs in 1877, which gives an average of about 21 francs per head of the population.

The floating debt, which the Government contracts either by receiving private deposits and using them for its needs or by issuing bills of exchange called *bons du trésor*, amounted in 1872 to 761,000,000 francs. This part of the public debt, including some other items under the name of *capitaux remboursables à divers titres*, appears in the budget of 1877 for the much lower figure of 300,226,686 francs.

Budget for 1877.

The following table gives a summary of the budget proposed for 1877:—

Expenditure.	Francs.
Ministry of justice and religion	87,960,485
" foreign affairs	12,720,500
" interior	81,528,386
" finance	1,497,042,632
" war	531,148,836
" marine and colonies	186,622,116
" public instruction and the fine arts	56,628,762
" agriculture and commerce	19,762,388
" public works	238,246,535
Government of Algeria	24,587,322
	2,736,247,962
Receipts.	
Direct taxes	412,470,600
Indirect taxes (excise)	1,039,293,800
Enregistrement, timbre, et domaines	634,605,451
Forests	38,548,680
Customs	268,355,800
Post-office	116,126,000
Miscellaneous revenues	227,600,481
	2,737,003,812

IX. *Army and Navy.*

Army.

The principle that every citizen is a soldier is the foundation of the military system of France; but it has received a new force and a more complete application from the law of the 27th July, 1872.

Compulsory service.

According to this law, every young man of twenty years of age, free from bodily defects, owes to the country five years of active service, five years in the territorial army, and six years in the reserve of the territorial army. The chief causes of exemption are physical infirmities and diminutive stature (the standard of height being 1 metre 54 centimetres or 60·631 inches). In a family of orphans, or of a widow, or

of a septuagenarian, or of blind parents, the eldest son is also exempt. If the eldest son is himself blind or invalid, the next one enjoys the privilege. Exemptions are likewise granted to brothers of soldiers on active service, or that have died when so engaged, or that have been pensioned, and to the elder of two brothers who should, on account of their age, be included in the same levy. Men serving in the navy, students of the Polytechnic school, of the *École forestière École des Langues orientales vivantes*, and *École des Chartes*, public teachers, and ministers of any of the religions recognized by the state are not called upon, but must serve the public in their respective capacities during a period which varies from five to ten years. In 1875, out of a total number of 283,768, 72,065 were exempted. 29,797 of them because of unfitness to serve, and 30,073 were deducted from the contingent as serving the state in some of the ways mentioned above. The law authorizes young men who hold the diploma of *bachelier*, or a certificate bearing that their studies have been carried on at a public school to a certain fixed standard (*certificat d'études*), and those who pass a special examination held for the purpose, to engage for one year as voluntary recruits, at the end of which they are sent home, provided they can give evidence of having received a good military training; but they are always, as long as they have not served for the time fixed by law, subject to be called out again in case of need. In 1875, 9804 men took advantage of this partial exemption. Voluntary enlistments are also permitted in the French army, which are binding for a period of not less than two years and not more than five. Many soldiers who have completed their legal time of service contract a re-engagement. Such *engagés volontaires* receive extra pay, but no bounty as formerly. They numbered 24,091 in 1875.

Military organization.

The minister of war is assisted at Paris by 2 general directors, a brigade major (*chef d'état major*), a historiographer, a law agent, and 434 other functionaries of various ranks, attended by 108 servants; the whole costs 1,895,350 francs a year.

Under the control of this central office, the army is divided into 19 corps, quartered in 19 territorial districts, Algeria being one of them. The infantry is composed of 144 regiments (three battalions of six companies each forming a regiment), numbering in all 225,111 men; 30 battalions of *chasseurs à pied* (light infantry), with 8 companies in each battalion, giving a total of 18,889 men; 4 regiments of *zouaves*, 12,000 men; 3 African battalions of light infantry, 3000 men; 5 *compagnies de discipline*, 1000 men; 1 foreign regiment, 3000 men; and 3 regiments of natives (Algerians), 9000 men. The cavalry consists of 75 regiments, viz., 12 cuirassiers, 26 dragoons, 19 *chasseurs* and 11 hussars,—numbering 47,498 men; 4 regiments of *chasseurs d'Afrique*, 3812 men; and 3 regiments of spahis, 2134 men. The ordnance comprises 38 regiments, each of them having 3 batteries served by foot soldiers, and 6 mounted batteries,—in all 42,500 men; 1 regiment of pontoon soldiers, 1877 men; 15 companies of workmen (*ouvriers*) and pyrotechnists (*artificiers*), in all 2215 men; 50 *compagnies du train*, 3870 men. There are 3 regiments of engineers, numbering 9000 men. Finally, 8000 men, distributed into 64 companies, are specially charged with the *équipages militaires*. The *gendarmerie* and the republican guard of Paris (mounted police) are also, for all military duties, under the orders of the minister of war, and now form a corps of about 40,000 men. France has thus in time of peace an effective force of about 440,000 men.

The French army is commanded by a staff of 5 marshals, 121 generals of division, and 200 generals of brigade. There are besides 81 generals of division and 107 generals of brigade on the rolls of the reserve.

The following table shows the division of France into 19 military districts:—

ALGERIA.	
AMIENS	Aisne, Oise, Somme, part of Seine-et-Oise, and Seine.
BESANÇON	Ain, Doubs, Jura, Haute-Marne, Belfort, Haute-Saône, part of Rhône.
BORDEAUX	Charente-Inférieure, Gironde, Landes, Basses-Pyrénées, Hautes-Pyrénées.
BOURGES	Cher, Côte-d'Or, Nièvre, Saône-et-Loire, part of Rhône.
CHÂLONS-SUR-MARNE	Ardennes, Aube, Marne, Meuse, Vosges, Meurthe-et-Moselle
CLERMONT-FERRAND	Allier, Loire, Puy-de-Dôme, Haute-Loire, Cantal, part of Rhône.
GRENOBLE	Hautes-Alpes, Drôme, Isère, Savoie, Haute-Savoie, part of Rhône.
LE MANS	Eure-et-Loir, Mayenne, Orne, Sarthe, part of Seine-et-Oise, and Seine.
LILLE	Nord, Pas-de-Calais.
LIMOGES	Charente, Corrèze, Creuse, Dordogne, Haute-Vienne.
MARSEILLES	Basses-Alpes, Alpes-Maritimes, Corse, Bouches-du-Rhône, Gard, Ardèche, Var, Vaucluse.
MONTPELLIER	Aude, Aveyron, Hérault, Lozère, Tarn, Pyrénées-Orientales.
NANTES	Finistère, Loire-Inférieure, Morbihan, Vendée.
ORLÉANS	Loiret, Loir-et-Cher, Seine-et-Marne, Yonne, part of Seine-et-Oise and of Seine.
RENNES	Côtes-du-Nord, Manche, Ille-et-Vilaine.
ROUEN	Calvados, Eure, Seine-Inférieure, part of Seine-et-Oise and of Seine.
TOULOUSE	Ariége, Haute-Garonne, Gers, Lot, Lot-et-Garonne, Tarn-et-Garonne.
TOURS	Maine-et-Loire, Indre-et-Loire, Deux-Sèvres, Vienne.

National guard.

The national guard no longer exists; one of the first measures of the Government of M. Thiers, after crushing the Parisian insurrection of 1871, was to suppress it.

Hôtel des Invalides.

Some institutions must be mentioned here as attached to the war department, and completing the military organization of France. The Hôtel des Invalides was founded by Louis XIV. as a house of refuge for old infirm soldiers of all grades; but the number of the inmates is always decreasing, as old soldiers now generally prefer to live at home on their pensions and private resources, rather than to live in common apart from their families and under military discipline. In 1875 the *Invalides* numbered only 642; but the same year the maintenance of the Hôtel cost the state 1,123,053 francs. The order of the Legion of Honor, founded by Bonaparte in 1802, embraces both soldiers and civilians among its members. It is composed of knights (*chevaliers*), officers, commanders, grand-officers, and grand-crosses. The chief of the government of France has the title of grand master, and is the head of the order, which is managed by a grand chancellor and a council, the members of which are appointed by the president of the republic, as well as all the *légionnaires*, whose number is now about 38,500. A military medal, with a yearly pension of 100 francs, has been awarded, since 1852, to private soldiers and non-commissioned officers who have distinguished themselves in the service or on the field.

Legion of Honor.

Navy.

Under the minister of the navy and the control office at Paris, which employs 260 officials, there are five maritime prefects, one in each of the maritime arrondissements of France. These are—Cherbourg, with the subdivisions of Dunkirk and Le Havre; Brest, with St. Servan; Lorient, with Nantes; Rochefort, with Bordeaux; and Toulon, with Marseilles, Nice, and Bastia.

The naval officers in active service are—2 admirals, 18 vice-admirals, 30 rear-admirals, 343 captains of ships or frigates, and about 1377 lieutenants and officers of inferior rank. There are besides 14 vice-admirals and 20 rear-admirals on the rolls of the reserve.

The recruiting of sailors for the navy is secured by the *inscription maritime*, established by Colbert in 1681, and regulated since by various decrees and laws. According to the law as it now stands, all fishermen and men employed on board merchant ships must have their names inscribed in a special register, and are bound to give, whenever required, a minimum of three years' service in the navy. In 1873 this register contained 151,830 names. A special body of ordnance, called *artillerie de marine*, is composed of 243 officers and 4216 soldiers, part of whom are in garrison in the colonies. The general staff of the naval ordnance at Paris is composed of a general of division, 2 generals of brigade in active service and 2 in the reserve, 1 colonel, 2 lieutenant-colonels, and a few subaltern officers. The administration is divided into 6 directions, the seats of which are Cherbourg, Brest, Rochefort, Toulon, Lorient, and La Villeneuve.

The marines in the fleet number about 15,000, divided into 4 regiments with 780 officers, and a staff consisting of

Rail Roads.....

Longitude West 2 from Greenwich

Longitude East 2 from Greenwich

2 generals of division, 4 generals of brigade, 1 chief of battalion, and 3 aides-de-camp.

The fleet consisted in 1876 of 110 vessels of all sizes (10 of them iron-clads of first and second rank), armed with 529 guns, and of a reserve comprising 18 iron-clads and 60 other vessels.

X. *Roads.—Railways.—Navigable Rivers and Canals.—Harbors.*

Before referring to the state of agriculture, manufactures, and commerce in France, it is important to have an idea of the means of communication by which the different productive districts are connected with one another. The minister of public works has the superintendence of all roads and ways, natural or artificial, by land or by water. A special department, called *Administration des Ponts et Chaussées*, assisted by a council with the minister as its president, is charged with the management of that important branch of public business; 569 engineers and inspectors, and 2153 inferior officials form the administrative staff.

Roads.

Roads are either national, departmental, military, or *vicinal* (cross roads). National roads are kept up entirely at the expense of the public treasury. The departments have to provide for departmental roads and a portion of the military roads, the rest being charged on the state. As to cross roads, or *chemins vicinaux*, they depend, by an awkward anomaly, on the ministry of the interior, and are kept up by the communes, or, when of a higher importance, by the departments. At the end of 1811, 229 roads were classified as imperial roads. They extended over a length of 46,500 kilometres (28,894 miles). In 1815, after the territory of France had been brought back to its ancient limits, the length was only 27,200 kilometres (16,901 miles); in 1873 there were 223 national roads, giving a total of 37,304 kilometres (23,180 miles), 2627 kilometres (1632 miles) of which are still paved like a street. The average breadth of that class of road is 16 metres (52 feet 6 inches), 6 metres for the causeway, 6 for the sideways, and 4 for the ditches and embankment. Although the great extension of railways has somewhat reduced the importance of high roads, it has been calculated that the traffic has changed very little during the last twenty years. The departmental roads are not quite so wide as the national ones, their average breadth being 12 metres (39 feet). In 1872 their length was 46,939 kilometres (29,167 miles). Military roads were made in the west of France, after the last insurrection of Vendée. They are 28 in number, distributed in the departments of Charente-Inférieure, Ille-et-Vilaine, Loire-Inférieure, Maine-et-Loire, Mayenne, Sarthe, Deux-Sèvres, and Vendée, and extend to a length of about 1500 kilometres (932 miles).

A sum of nearly 34 millions of francs is spent yearly for the purpose of making new roads or repairing old ones. The *chemins vicinaux*, or cross roads establishing a communication between rural places not far distant from each other, are managed by a special branch of the department of the minister of the interior; about 3000 *agents-voyers* and 42,000 *cantonniers* or workmen are specially charged with the duty of keeping them in repair. In 1872 these roads, divided into three classes according to their importance, were 544,390 kilometres (338,273 miles) in length, and covered a surface of about 370,000 hectares (915,000 acres). To the very considerable resources which the communes must apply to the extension and repair of their rural roads the Government used to add a yearly grant of 11,500,000 francs; but this sum has been reduced to 5,750,000 francs since 1873. The *Annales* of the administration of the *Ponts et Chaussées* mention 1982 large bridges, of which 79 are cast iron. The chief are the bridge over the Gironde at Bordeaux, which has 17 arches, is 501 metres (1643 feet) in length, and cost 6,850,000 francs; the bridge of Cubzac, over the river Dordogne; the turning bridge of Penfeld at Brest; the bridge St. Esprit, over the Rhone, with 18 arches on a length of 730 metres (2395 feet); those of Toulouse, Libourne, Tours, and Rouen; the new bridge (*Pont-Neuf*) and the bridge of Iéna at Paris; and the bridge of La Guillotière at Lyons.

Railways.

Although the system of railways in France is far from being so complete as in England and Belgium, the country is now traversed by great lines which connect together all the principal towns; and lines of less importance have been made, or will ere long be established, in every district. The chief lines, which are worked by powerful companies under the superintendence of the state, are—(1) the *Chemins de fer du Nord*, which run between Paris and Soissons, Boulogne, Calais, Rouen, Amiens, etc., traverse the coal districts of Picardy, and reach the Belgian territory at Quiévrain and at Tournay; (2) the *Chemins de fer de l'Est*, from Paris to Strasburg, Mulhouse, and Basel in Switzerland, through Alsace, with branch lines to Sedan, Metz, Luxembourg, Rheims, Sarreguemines, etc., joining Belgian and Prussian railways at several points of the frontier; (3) the *Chemins de fer de l'Ouest*, which traverse Normandy in every direction, and connect Paris with the towns of Brittany; (4) the *Chemins de fer d'Orléans*, which go to Nantes, Bordeaux, Limoges, Bourges, and Toulouse; (5) the *Chemins de fer de Paris à Lyon et à la Méditerranée*, which connect the valley of the Seine with that of the Rhone, and have branch lines to St. Etienne, Clermont-Ferrand, Grenoble, Toulon, Cette, etc., establishing regular and direct communication between France and Switzerland—the railways of Savoy being also worked by the same company. Paris is the starting point and the administrative centre of all these lines. Another great line worked by the *Compagnie du Midi*, starts from Bordeaux, which it connects with Cette and Bayonne, with branches between Bayonne, Toulouse, and Foix, Agen and Tarbes, Toulouse and Auch, Montpellier and Milhau, etc. Through this line Spain is brought into communication with France.

The other lines worthy of mention are—the railways of the Charentes, connecting La Roche-sur-Yon, La Rochelle, Rochefort, Coutras, Angoulême, Saintes, Limoges, and St. Jean d'Angély; the line from Chauny to St. Gobain; the railway of the docks of St. Ouen, Paris; the line from Dunkirk to Fumay (Belgian frontier); those from Épinay to Velars, from Béthune to Lille, from Somain to Anzin and the Belgian territory, from Vitré to Fougères, and from Perpignan to Prades; the Médoc railway; the Vendée railways; and the *Chemin de fer de ceinture*, which encircles Paris.

The capital required for the making of these railways has been calculated at not less than 10,000,000,000 francs—which gives, for a total length of 21,987 kilometres (13,662 miles), an average of 297,000 francs per kilometre, or £19,118 per English mile. The state has granted and still grants large sums to the companies; but in return they are subject to a tax in proportion to their traffic, as well as to other dues, which are a considerable source of revenue to the public treasury, the profit realized by it having been 55,942,330 francs in 1873. The yearly returns of the companies show an average income of 840 millions of francs.

Navigable rivers and canals.

All navigable rivers are state property. A table is subjoined of the navigable rivers arranged by basins, with the length of their navigable course, and also of the canals and the small rivers which have been converted into canals. Owing to the cheap rate of transport by water, canal traffic has been but little injured by the extension of railways, this inexpensive way of conveyance being used for heavy goods

whenever practicable. In 1875, 1,721,070,943 kilometric tons (about 1,748,500,000 tons avoirdupois) were carried by river and canal navigation, besides 176,551,434 cubic metres (230,933,000 cubic yards) of wood or *bois flotté*. The duties levied on these goods amounted to more than 4,177,940 francs.

Harbors.

France is but very inadequately provided with harbors; her long tract of coast washed by the Atlantic and the Bay of Biscay has scarcely three or four good seaports, and those on the southern shore of the channel form a striking contrast to the spacious maritime inlets on the English side. To begin from the north-east, Dunkirk has a small harbor, enlarged, however, by docks, and approached in the Dutch manner by a canal leading from the sea. Calais, one of the best ports on the coast, is not to be compared with Dover. Boulogne has a roadstead, which has been of late greatly deepened and improved. The port of Dieppe is exposed, and of course unsuitable for winter. The best mercantile harbor in the north of France, Le Havre-de-Grâce, at the mouth of the Seine, has large basins and docks, formed at a very great expense. Cherbourg is now a port and arsenal of great utility and importance to the navy; its roadstead, extensive but open, has a sea-wall, affording protection from the swell of the sea; and its spacious dock, excavated since the beginning of this century, at an expense of £3,000,000 sterling, is capable of containing fifty sail of the line. St. Malo, on the north coast of Brittany, possesses a good and large harbor, with quays extending to a length of 2955 metres (3231 yards); its entrance is protected by fortified islets. Brittany also possesses Brest, the great maritime port of the Atlantic for the navy, and, in the south-west, Lorient. Proceeding further to the south, we find Nantes, with its two ports at the mouth of the Loire, Paimbœuf and St. Nazaire; Les Sables d'Olonne, now connected with Liverpool by a regular service of steamers; Rochefort, on the Charente, one of the great dockyards and naval stations; La Rochelle, a small but secure harbor; and Bordeaux, where the Gironde is nearly equal in width to the Thames at London. From this there is no seaport worthy of mention until we reach Bayonne, a place of difficult access. On the Mediterranean, France has the ports of Cette, Marseilles (the most spacious and secure on the coast), Nice, and the great maritime port, arsenal, and dockyard of Toulon.

XI. *Agriculture.*

Agricultural population.

The rural population of France is equal to about a half of the total number of the inhabitants. The census of 1872 gave a return of 18,513,325, or 52·71 per cent. of the whole population. That number was divided thus:—

Landowners living on their estates	9,097,758
Farmers and tenants	4,570,068
Gardeners and nurserymen	378,827
Woodcutters and charcoal burners	270,743
Servants	940,311
Day laborers	3,255,618

Progress in agriculture.

In the general description of the country, some information has been given as to the nature of the soil and its various kinds of produce, which must be supplemented here. The extent of agricultural improvement in France since the first Revolution has certainly been less than in England and Scotland, and it has been repeatedly said that this inferiority had its chief cause in the insignificant size of the occupancies, a feature of French agriculture which Arthur Young observed in his time, but which has been much increased by the law obliging a father to make an almost equal division of his property amongst his children. It would be perhaps nearer the truth to say that generally the more fertile a country is the less care the inhabitants take to cultivate it; if we add to this the influence of the climate, which makes country people more frugal, and at the same time more indolent, we shall be able to account for the difference in the state of agriculture as between the northern and the southern provinces of France. It does not appear, however, that land thus divided produces less in proportion than large estates, and, notwithstanding the great progress that France has still to make, it is in an agricultural point of view as rich as any other country.

Average land value and rent.

The *Statistique Officielle* gives a statement of the average value of land per hectare, and the average rent paid for it, distinguishing in each case three classes of land, thus:—(1) Lands under tillage: value, 3066, 2175, 1355 francs; rent, 96, 69, 45 francs; (2) meadows: value, 4151, 3958, 2022 francs; rent, 152, 104, 72 francs; (3) vineyards: value, 3564, 2638, 1783 francs; rent, 139, 98, 68 francs.

The value of wood varies from 2877 to 1435 francs for the forests, and from 1081 to 569 francs for copsewoods.

Grain crops.

The cultivation of grain has always been the chief business of French agriculturists. In 1873 about 13,000,000 hectares were under this crop, and in 1875 this had increased to about 15,000,000. distributed thus:—

	Hectares.	Average Crop per Hectare.	Total Produce.
		Hectolitres.	Hectolitres.
Wheat	6,961,419	12·04	83,861,193
Meslin	503,178	12·50	6,287,301
Rye	1,912,601	10·86	20,779,367
Barley	1,118,071	16·75	18,732,827
Oats	3,182,456	21·33	67,891,995
Buckwheat	677,626	14·35	9,722,257
Maize	505,993	14·72	8,918,352
Millet	49,984	12·24	612,031

Wheat sells at prices varying from 20 to 26 francs a hectolitre (46s. 6d. to 60s. 5d. a quarter), and costs the agriculturist about 17 francs 50 centimes (40s. 8d. a quarter). The quantity which is produced in France, large as it is, does not meet the wants of the population, and several millions of hectolitres are every year imported from Russia, Prussia, Roumania, Spain, Italy, Egypt, and America.

The cultivation of meslin and rye is on the decline; wherever the progress of agricultural science had succeeded in making a poor soil more rich and fertile, wheat takes their place, as being better and more profitable.

The area allotted to barley has been much the same for a long period, and is likely to remain so. The same may be said of maize, which is especially cultivated in the east and south-west, and of buckwheat, which in Auvergne and Brittany forms no small part of the food of the inhabitants. Oats are extensively cultivated and yield a good return this crop was on the increase from 1815 to 1862, but has since been almost stationary.

Other crops.

Potatoes form a very important article, occupying in 1873 1,176,496 hectares (2,907,290 acres), and yielding 120,410,929 hectolitres (331,274,554 bushels).

The other crops are tabulated here with the results they yielded for 1873:—

	Hectares.	Average Crop.	Total.
		Hectolitres.	Hectolitres.
Pease, beans, etc.	322,681	13·74	4,434,107
Chestnuts	482,247	13·68	6,567,381
Colza and other oleaginous plants	214,808	13·34	2,963,441
Olive trees	148,626	...	4,594,010
		Quintals.	Quintals.[1]
Beet	253,335	306	77,435,100
Hops	3,528	14	50,244
Tobacco	14,858	12	172,522
Hemp	95,521	5·28	503,941
Flax	87,671	5·75	503,917
Miscellaneous	10,900	20	319,898

[1] The *quintal métrique* is 3½ lb less than 2 cwt.

Meadows. Meadows, both natural and artificial, are very numerous in France, and give a higher return than any other kind of land. Artificial meadows, sown with clover or lucerne, have considerably increased in extent, as will be seen from the following comparative table:—

	1842.	1852.	1862.
	Hectares.	Hectares.	Hectares.
Natural meadows	105,103,888	129,290,229	160,095,347
Artificial meadows	47,256,674	84,806,847	103,663,376
Pasturage of various kinds	22,500,000	36,049,858	39,355,398
	174,860,562	250,146,934	303,114,121

Vineyards. The vineyards cover 4·27 per cent of the surface of France, and are one of the chief sources of its agricultural wealth. They are to be found, more or less, in every district, except in ten northern departments, viz., Calvados, Côtes-du-Nord, Creuse, Finistère, Manche, Nord, Orne, Pas-de-Calais, Seine-Inférieure, and Somme. In 1862, according to statistical documents then published by the Government, the departments in which the vine was most extensively cultivated were—Hérault (162,172 hectares), Charente-Inférieure (157,753), Gironde, (126,220), Charente (100,008), Gers (94,790), Gard (94,200), Dordogne (87,252), Aude (81,869), Var (79,040), Lot-et-Garonne (69,166). The vintage of 1876 gave a total of about 41,846,748 hectolitres (921,033,017 gallons).

Live stock. The census taken in 1872 gave 2,882,851 as the total number of horses, comprising 400,454 colts, 351,654 stallions of 4 years and upwards, 872,911 geldings, and 1,257,832 mares. The number of mules was 299,129, and of asses 450,625. The returns for the same year gave 10,023,716 head of cattle and 24,707,496 sheep. The goats, particularly numerous in Corsica and some mountainous parts, were 1,791,725. The addition of 2,500,000 beehives, of a total value of about 32,800,000 francs, 58,300,000 poultry of all kinds, and 2,300,000 dogs completes the enumeration in its principal divisions of the live stock of agricultural France.

Ministry of agriculture. In France the interests of agriculture are entrusted to a special minister. Under him are general inspectors, whose duty it is to visit the different parts of the country, and to report on their respective position and wants. These reports serve to determine the distribution of grants and rewards which the state dispenses every year. In 1869 the sum of money given as relief in cases of fires, cattle disease, and damage caused by storms, frost, or excessive drought, floods, and other accidents, amounted to 2,171,340 francs. As rewards, the state gives premiums to the owners of the best stallions and broodmares (826,000 francs in 1873); it supports by grants riding schools and establishments for training horses (160,500 francs), gives prizes for racehorses (404,500 francs), and distributes about 1,400,000 francs a year for the creation and maintenance of agricultural societies. The principal object of these societies is the organization of provincial shows of cattle, implements, and agricultural produce, under the name of *comices agricoles*. The Government has, besides, founded institutions that are entirely under its management and belong to the state. Such are the sheep-folds of Haut-Tingry (Pas-de-Calais) and Rambouillet (Seine-et-Oise), the cow-house of Corbon (Calvados) for the breeding of Durham cows only, and the *haras* or stallion stables. These stables, containing together about 1085 horses, and kept at an expense of 1,844,000 francs, are established in 22 central towns, and send stallions every year to 340 stations. Two great banking establishments have been founded in order to help those who are engaged in agricultural business. The one, the *crédit foncier*, grants loans on land securities; these loans amounted for the year 1872 to 45,482,242 francs 60 centimes, divided among 1156 borrowers. The other, the *crédit agricole*, which dates from 1860, discounts bills and lends on personal or other security, but always with the object of promoting the progress of agricultural pursuits. In 1872 this company negotiated bills to the value of 248 millions of francs. It paid the same year a dividend of 15 francs for each 500 francs share. The *crédit foncier*, which is an older institution (1852), paid 35 francs for each share of the same value.

XII. *Manufactures, Mines, and Quarries.*

Textile manufactures. One of the foremost branches of manufacture in France is that which has for its object the working up of textile materials. The gross amount of its produce is not less than 3,500,000,000 francs a year, and statistics published in 1873 return it as employing 308,481 men, 306,898 women, 69,948 children, 2777 steam-engines, and about 9,500,000 spindles. These figures relate to the period between 1861 and 1865, and are certainly very much less than if the enumeration had been taken more recently.

Linen. The flax gathered in 1873 weighed 54,874,740 kilogrammes (1,081,276 cwt.), and represented a minimum value of 84 millions of francs; to which must be added 10,188,721 kilogrammes (200,766 cwt.) of hemp, at an average price of one franc a kilogramme. About 800,000 spindles are kept busy with this material. In this branch of trade the department of Nord ranks first; it manufactures more than one-third of the total amount of linen produced. Seine, Sarthe, Maine-et-Loire, Seine Inférieure, Calvados, Ille-et-Vilaine, Lot-et-Garonne, Indre-et-Loire, and Seine-et-Oise are, next to the department of Nord, the chief seats of this industry.

Cotton. The cotton manufacture has its centre in Normandy. More than a third of the total produce of the French cotton looms comes from the department of Seine-Inférieure; Nord, Vosges, Calvados, Aisne, Aube, Orne, Meuse, and Eure have also a large share in the production of cotton yarn and cotton cloth. The department of Rhône is famous for its cotton muslins, the value of which is not less than 28 millions of francs. Meurthe produces a special kind of trimming, valued at about 3 millions of francs a year. French cotton goods cannot cope in cheapness with the English, but they are of fine quality, and on this account command a sale in the markets. In the absence of authentic documents, we may safely estimate the produce of cotton manufacture for 1872 at 500 millions of francs, and the plant engaged in the trade at 6 millions of spindles and 260 millions of looms of various kinds. The loss of Alsace has been a heavy blow to the cotton trade of France.

Woollen. In the woollen factories 3,200,000 spindles are employed, giving work to more than 172,000 people. Wool fabrics amount in value to 1,200,000,000 francs, figures which present a striking contrast to the valuation of Count Chaptal in 1812, which was not above 250 millions of francs. Large manufacturing houses are to be found especially in the departments of Ardennes (Sedan), Nord (Lille, Cambrai, etc.), Marne, Eure (Louviers), Hérault; while Rhône is noted for shawls, Bouches-du-Rhône for washing and combing, Calvados for wool yarns, Aisne for both yarns and tissues, Aude for drapery, etc. The special manufacture of Paris is that of shawls, damasks for furniture, merinos, and lighter fabrics as gauzes, muslins, bareges, etc.

Silk. The rearing of silk-worms and the production of silk can be traced far back in the industrial history of France. The first Avignon pope, Clement V., is said to have introduced the first silk-worms and the first mulberry trees (1305). This branch of industry soon assumed a national character, and all kings who, like Louis XI. and Henry IV., cared for the progress of commerce and manufactures, gave it encouragement and privileges. In 1780 France produced 6,600,000 kilogrammes of cocoons (14,549,194lb), having a value of 15,500,000 francs. The

following table shows the progress made in the rearing of silk-worms from that date:—

Years.	Weight of Cocoons.		Value.
	Kilogrammes.	Cwt.	Francs.
1781–88	6,200,000	122,167	18,600,000
1789–1800	3,000,000	59,113	9,800,000
1801–1807	4,200,000	82,761	13,600,000
1808–12	5,147,800	101,436	17,502,550
1813–20	5,200,000	102,463	21,520,000
1821–30	10,800,000	212,808	44,080,000
1831–40	11,537,000	227,132	42,840,000
1841–45	17,500,000	344,631	66,500,000
1846–52	24,254,000	477,911	91,816,000
1853	26,000,000	512,335	117,000,000
1863	9,578,804	188,745	51,916,837
1867	14,082,942	277,496	98,580,515
1869	8,076,545	159,144	60,170,260
1872	9,871,116	194,505	60,707,363

These 9,871,116 kilogrammes of cocoons gave 636,800 kilogrammes (12,547 cwt.) of raw silk. Twenty-one departments are engaged in the rearing of silk-worms,—those which yield the largest produce being Gard, Drôme, Ardèche, Vaucluse, Bouches-du Rhône, Var, Isère, Hérault, Basses-Alpes, etc. After having undergone the various operations which transform the cocoon into regular yarn, the silk goes to the weaver. Nine-tenths of the silk is woven at Lyons, by 120,000 looms, belonging to 400 firms, with nearly 800,000 workers, who every year produce silk goods to a value of about 460 millions of francs.

Lace and embroidery.

The manufacture of lace gives employment to 240,000 women at Alençon, Bailleul (Valenciennes), Lille, Chantilly, Caen and Bayeux, Mirecourt, Le Puy, and Paris; and there are 150,000 embroiderers spread over Paris, Lyons, Nancy, Épinal, Tours, Mirecourt, Lunéville, Plombières, St. Mihiel, St. Dié, Alençon, Tarare, Caen, Le Puy, Lille, Cambrai, St. Quentin, etc. The two industries contribute to the public wealth about 90 millions of francs every year.

Hosiery.

Cotton hosiery has its central point in the department of the Aube, wool in Picardy, and silk at Nîmes, Lyons, and Paris; the last also manufactures nearly the whole produce of France in linen hosiery. The annual value of this branch of industry may be stated approximately at 200 millions of francs.

Shoemaking.

The number of shoemakers is above 83,000, and they employ about 120,000 workmen and assistants. Shoes of cloth (*chaussons*) are made by 819 firms, employing 5200 workmen and assistants; and wooden shoes, an important branch of the business, are made chiefly in the departments of Cantal, Orne, Sarthe, Vosges, Vaucluse, and Puy-de-Dôme, and in Brittany, by 34,700 makers, assisted by 77,500 workmen. It has been calculated that this article has a value of about

Gloves.

530 millions of francs. Paris, Grenoble, Lunéville, Vendôme, Blois, Béziers, Annonay, and Niort are the chief seats of the manufacture of gloves, which represents a sum of about 70 millions of francs.

Other clothing.

Hats and caps are made every year to the value of 50 millions, by 6200 houses, employing about 24,000 workmen. Millinery, chiefly made in Paris, gives work to about 4000 persons, most of whom are women. It may be valued at 25 millions of francs. Tailors and outfitters of all kinds number about 74,000, and give work to 82,000 workmen, seamstresses, and shop-assistants.

Beet sugar.

Beet sugar is extensively made in the north of France. The manufacture of this sugar in a raw state was thus distributed for the year 1876:—

	Kilogrammes.	Cwt.
Aisne	92,721,965	1,827,034
Nord	111,114,778	2,189,454
Oise	41,367,892	815,131
Pas-de-Calais	60,102,110	1,184,278
Somme	67,747,541	1,334,927
Other departments	75,817,002	1,493,931

These quantities are produced by about 510 manufactories. Ninety establishments are especially engaged in refining the first produce extracted from beetroot, or from the sugar cane; about 180,000 tons of raw sugar are received annually from the colonies, French and foreign, by these refining establishments, which employ 3400 workers. The yearly value of the manufacture amounts to 140 millions of francs.

Liquors.

Wine, treacle, and the juice of the beetroot are the substances from which the largest quantity of the alcohol produced in France is extracted. About 3500 firms are engaged in distillation; the produce for the year 1875–76 was divided thus:—

	Hectolitres.	Gallons.
Alcohol distilled from wine	415,967	9,155,295
" " corn and potatoes	97,467	2,145,217
" " beetroot	315,024	6,933,572
" " treacle	681,734	15,004,739
" " other substances	48,017	1,056,838
	1,558,209	34,295,651

To this 429,648 hectolitres (9,456,409 gallons) are to be added, distilled by small proprietors who do not manufacture much more than for their own consumption, and are known by the name of *bouilleurs de cru*. Normandy and Brittany are the chief centres for the production of cider. In 1876 about 7,035,669 hectolitres (154,845,539 gallons) were manufactured. There are about 3200 brewers, who send out not less than 7,400,000 hectolitres of beer (162,871,543 gallons), worth about 200 millions of francs; but, as hops are but little cultivated in France, 3 millions of francs are spent yearly in importing them. The largest manufactories of vinegar are in the departments of Loiret and Loire-Inférieure; it is made almost exclusively from wine, but malt and some other substances are now beginning to be used. The total value is about 3 millions of francs.

Tanning.

The dressing and tanning of hides and skins have greatly increased of late years; they now represent a sum of 400 millions of francs, or about a million of francs more than in 1852.

Soap.

The principal soap manufactories are at Marseilles, its production being 800,000 quintals (1,576,354 cwt.); Nantes and Paris hold the second rank. It has been calculated that France produces annually 2 millions of quintals (3,940,886 cwt.) of soap.

Candles.

Candles are chiefly made at Paris. This branch of manufacture has a total value of 300 millions of francs, whilst the production of soap amounts to 450 millions.

Perfumery.

French perfumery is appreciated through the world, and gives a yearly return of more than 50 millions of francs.

Pottery and glass.

The departments of Vienne, Seine, Sarthe, and Puy-de-Dôme are the centres of the fabrication of earthenware and bricks; in Haute-Vienne, Var, and Gironde the special manufacture is china. In 1847 official statistics valued at 85,964,000 francs the total produce of that industry; but this value has certainly more than doubled since. A great manufactory kept up by the state at Sèvres forms a school in which artistic workmen are trained, so that the art is maintained in a high degree of perfection. Crystal wares are made in eight works, established in the departments of the Meurthe-et-Moselle, Seine, and Orne, among which special mention must be made of Baccarat, which is to this branch of industry what Sèvres is to the ceramic. Looking-glasses are a very important article of manufacture in France,—that country possessing no fewer than 6 out of the 15 or 16 establishments in Europe. The principal manufactory is at St. Gobain (Aisne), and the value of the produce of the whole is above 14 millions of francs. Glass of a more common kind is made in about 250 establishments, and is valued at 80 millions of francs. The departments of Nord, Haute-Saône, Haute-Loire, Allier, Seine-Inférieure, Seine, Aveyron, and Loire are famed for common window and plate glass; bottles are chiefly manufactured in the department of Nord, and in the basins of the Loire and Rhône; the most ancient works established for this manufacture are at Quiquengrogne (Aisne), and date as far back as 1291.

Paper.

The most important paper-mills are situated in Charente, Pas-de-Calais, Seine-et-Oise, Isère, Vosges, Seine-Inférieure, Seine, Eure, and Seine-et-Marne. Paris is celebrated for its paper-hangings and stained papers. In 1856 Moreau de Jonnès valued the produce of this manufacture at 55 millions of francs. Notwithstanding the special taxes now levied on it, this amount has undoubtedly increased by a large sum.

Books and prints.

In the period between the 1st November, 1811, and the 31st December, 1872, 603,849 works have been published in France, subdivided thus:—

Books and pamphlets in all languages	463,617
Engravings, maps, and plans	85,787
Musical publications	54,445

In 1872 the number of publications of all kinds was 15,744, 3614 of which were musical works, and 1571 engravings, maps, or plans. Proprietors of political newspapers must deposit with the treasury a guarantee that they will pay the fines to which the press law often renders them liable; security to the amount of 24,000 francs is required in the department of Seine, and 12,000 francs in the others. If the paper appears only once or twice a week, the security required is only 18,000 francs in the department of Seine and 6000 in the rest of France. The paper on which political newspapers are printed is charged besides with a tax of 20 francs per 100 kilogrammes (about 8s. 1½d. per cwt.). Notwithstanding this 854 political newspapers, 210 of which were daily, were published in France (54 of them in Paris) in 1873. Non-political periodicals were not fewer than 1220, to which number Paris contributed 718, divided thus:—religious, 81; educational, 21; legal, 42; administration, 18; political economy, insurance, and commerce, 40; stock-exchange interests, 39; medical, 54; natural philosophy, 45; agricultural, 37; military and naval, 23; history and geography, 17; fine arts and architecture, 49; literary and critical, 56; fashion and the amusement of the young, 84; archæological, 14; public works, 26; technology and popular science, 50.

The printing and bookselling trades are carried on by about 7000 persons, who may be classed as follows:—

	Paris.	Departments.	Total.
Printers	88	944	1032
Printers and lithographers	549	911	1460
Copper-plate printers	67	61	128
Booksellers	1034	3354	4388
	1738	5270	7008

Coal. The principal mines which France possesses are coal and iron mines. Coal-pits are almost exclusively confined to the east, south-east, and north of the country. The richest departments are Nord (239 square miles), Pas-de-Calais (201), Gard (187), Saône-et-Loire (165), Hérault (113), Loire (110), and Bouches-du-Rhône (107). The whole area is about 2200 square miles, and comprises 623 separate *concessions*, which, however, are not all being worked. The yield of coal mines in 1876 was 170,477,613 quintals (16,795,824 tons), the following being the most productive districts:—

Names of the Basins.	Departments.	Quintals.
Valenciennes	Nord, Pas de Calais	65,332,909
Loire	Loire, Rhône	34,717,183
Alais	Ardèche, Gard	16,448,387
Creuzot; Blanzy	Saône-et-Loire	9,905,876
Commentry	Allier	9,219,227
Aubin	Aveyron	7,046,129
Aix	Bouches-du-Rhône, Var	3,545,100
Graissessac	Hérault	2,757,831
Carmaux	Tarn	2,571,700
Ahun	Creuse	2,150,828
Brassac	Haute-Loire, Puy-de-Dôme	2,020,896
Ronchamp	Haute-Saône	1,998,332
St. Eloy	Puy-de-Dôme	1,772,765
Decize	Nièvre	1,626,430
Epinac	Saône-et-Loire	1,490,170
Le Maine	Mayenne, Sarthe	1,190,680
Le Drac	Isère	1,086,520
Hardinghem	Pas-de-Calais	942,734
Basse-Loire	Loire-Inférieure, Maine-et-Loire	680,293
Vouvant, Chantonnay	Deux-Sèvres, Vendée	445,819
Buxière-la-Grue	Allier	437,282
Manosque	Basses-Alpes, Vaucluse	388,054
Bert	Allier	358,145
Sainte-Foy-l'Argentière	Rhône	332,103
Maurienne - Tarentaise, Briançon	Hautes-Alpes, Savoie	299,690

Peat. Peat is to be found in 40 departments, but especially in Somme, Pas-de-Calais, Loire-Inférieure, Isère, Oise, Seine-et-Oise, Aisne, Nord, Doubs, Marne, Vosges, and Aube. The cutting of this fuel, so useful to the poorer classes, gives work to from 30,000 to 40,000 men, whose wages amount to a total of about 4 millions of francs. The mines of mineral tar yield about 3 millions of quintals (295,566 tons) annually. Saône-et-Loire, Allier, and Ardèche are the principal centres of its production.

Iron. France is very rich in iron mines; but as these are generally far from the districts which produce coal, the working expenses are considerably increased, and sometimes to such an extent that the metal extracted cannot repay the outlay required for its extraction, and the mines have to be abandoned. The production of iron, however, is on the increase, and reaches 7½ millions of quintals (738,915 tons), which represent about 14,500,000 quintals (1,428,571 tons) of pig-iron. The details in quintals of this production for 1876 are appended:—

Departments.	Pig-Iron.	Iron.	Departments.	Pig-Iron.	Iron.
Allier	947,730	247,990	Marne	29,226	
Ardèche	808,597		Haute-Marne	841,193	822,026
Ardennes	142,700	348,650	Mayenne	20,553	130
Ariége	209,195	87,550	Meurthe-et-Moselle	3,267,959	568,393
Aube	1,200	69,906	Meuse	176,150	125,000
Aveyron	297,230	368,250	Morbihan	25,350	
Bouches-du-Rhône	225,000	13,400	Nièvre		203,137
Charente		6,750	Nord	1,486,525	1,778,343
Cher	351,185	34 596	Oise		166,653
Corse	48,000	12,000	Orne		1,900
Côte-d'Or	110,200	150,450	Pas-de-Calais	602,390	6,000
Côtes-du-Nord	14,750	25,006	Basses-Pyrénées		4,432
Dordogne	54,900	44,823	Pyrénées-Orientales	79,074	
Doubs	30,677	32,412	Haut-Rhin (Belfort)		11,313
Eure	48,520		Rhône	697,737	
Finistère		4,767	Haute-Saône	128,735	20,570
Gard	854,868	255,878	Saône-et-Loire	1,506,927	509,925
Haute-Garonne		17,000	Sarthe	8,422	1,442
Gironde	55,000	9,442	Savoie	2,850	1,255
Ille-et-Vilaine	19,790	1,550	Haute-Savoie		7,960
Indre	39,970	16,925	Seine		240,400
Isère	220,369	73,145	Seine-Inférieure		6,047
Jura	297,310	167,140	Seine-et-Oise		25,085
Landes	152,135	25,566	Somme		8,300
Loir-et-Cher		2,350	Tarn		7,264
Loire	467,895	569,901	Tarn-et-Garonne	53,500	49,750
Loire-Inférieure	83,600	66,500	Vienne		1,600
Lot-et-Garonne	128,000		Vosges		17,075
			Yonne		96,806
				14,495,377	7,332,716

In some iron-works, especially those which are established in the chain of the Pyrenees, wood is still used as fuel; 185,024 quintals (18,266 tons) of iron were made by this process in 1876. The production of steel was for the same year 2,618,767 quintals (258,006 tons), the largest part of which came from the departments of Loire, Saône-et-Loire, Gard, Allier, Nord, and Rhône.

Other metals. In 1864 there were 64 mines from which other metals than iron were extracted, viz., 39 of silver ore (*galène argentifère* and *alquifoux*) in the departments of Hautes-Alpes, Finistère, Gard, Haute-Garonne, Ille-et-Vilaine, Isère, Loire, Haute-Loire, Lozère, and Puy-de-Dôme; 12 of copper (Rhône and Vosges); 8 of antimony (Cantal, Haute-Loire, Lozère, Puy-de-Dôme); 4 of manganese, and 1 of nickel. There were 5066 men employed in working these mines, which gave a return of 4,955,515 francs. But these statistics cannot be relied on, except for the year of their publication, as old mines are constantly closed and new ones opened. In 1869, for example, there is no mention of silver mines, and the mines of manganese are 9 in number instead of 4 as given above.

Quarries. The quarries of France are about 24,000 in number, giving employment to more than 88,000 men. The last valuation of the produce was made in 1846, and amounted to 41,047,519 francs, but it must be much higher now. Marble is abundant, especially in the departments of Pyrénées, Bouches-du-Rhône, Puy-de-Dôme, Hérault, Hautes-Alpes, Corse, Ariége, etc. Alabaster is found in the departments of the Yonne, in the valley of Aspe (Pyrénées), at Lagny (Seine-et-Marne), and at Montmartre (Paris). Lithographic stones are common in the departments of Ain, Indre, and Côte-d'Or. Slates are principally extracted from the quarries of Cherbourg and St. Lô (Manche), Angers (Maine-et-Loire), and Fumay (Ardennes). Limestone is abundant in 50 departments, and 38 yield plaster.

Gold and silver work. Paris is the chief centre of the manufacture of artistic objects in gold or silver; in 1860 the workmen were 18,731 in number, distributed among 3199 establishments, and the business was transacted to the value of not far from 184 millions of francs. Lyons holds the second place, and then Bordeaux, Marseilles, Nîmes, Besançon, Clermont-Ferrand, and Toulouse. The gross value of the various metals used by the

trade at the same period was calculated at 52,625,000 francs, silver forming about a third of the whole.

Watches and clocks.

The manufacture of watches and clocks yields a revenue of 30 millions of francs. Large iron clocks are made at Morez (Jura); time-pieces are constructed in part at St. Nicolas d'Aliermont (Seine-Inférieure) and at Montbéliard, and finished at Paris; watches are begun at Montbéliard and Cluses (Haute-Savoie), and finished at Paris and Besançon. This last town is the central place of the trade, and represents 99½ per cent. of the total manufacture; 15,000 persons, men, women, and children, are employed in this trade, and in 1872 they turned out 135,276 gold and 259,626 silver watches.

XIII. *Commerce and Banking Establishments.*

Inland trade.

Commerce is naturally divided into home and foreign trade, the former being greatly more important than the latter. It is impossible to give a strict and correct valuation of the inland traffic, but, judging of the whole from the few accessible details, we may, without exaggeration estimate its amount at about 35 or 40 thousand millions of francs. The gross weight of goods conveyed through the canals and navigable rivers has been given above (p. 458); these goods principally consist of coals, wood, stones, metals, wines, corn, and other heavy materials. This mode of conveyance is slow, but cheap, the duty levied varying from 1 to 5 centimes per 1000 kilogrammes per kilometre, *i. e.*, the maximum rate is about ¾d. a ton per mile.

The administration of public works published in 1867 a table of the traffic on French railways by goods trains, from which the following is an extract:—

	Metric Tons.		Metric Tons.
Flour and corn	3,233,369	Manures	521,932
Wine, spirits, and vinegar	2,670,424	Coals	11,638,662
Grocery and provisions	1,836,678	Carriages	11,724
Metals	3,298,317	Horses	218,504
Building materials	5,242,354	Cattle	5,929,667
		Miscellaneous	10,124,766

In 1869 the total weight of goods conveyed by *petite vitesse* (goods trains) was 44,013,433 metric tons.[1] Since that time a considerable increase has evidently taken place, the consequence at once of the general progress of commerce and of the great extension of railways.

Coasting trade.

The coasting trade has always been of great importance in France, though it is far inferior to that of England. In 1875 the total weight of goods transported by coasters was 2,022,559 tons, an increase of nearly 7000 tons on the preceding year. These goods were of various kinds,—building materials (258,174 tons), wines (225,595 tons), salt (213,185 tons), wood (207,211 tons), corn and flour (199,461 tons), coals (125,243 tons), being the chief articles in the general traffic. 62,396 vessels, the tonnage of which amounted to 3,207,933 tons, were engaged in this trade, while in 1874 there were only 57,888, of 2,952,414 tons. The harbors most frequented by coasters are Marseilles, Le Havre, Bordeaux, Dunkirk, Rouen, Cettes, Dieppe, Nantes, St. Nazaire, and Boulogne.

Fisheries.

The annual produce of river and pond fishing in the interior of France may be valued at about 10 millions of francs. Coast fishing was carried on in 1871 by 8995 boats, manned by 38,150 men, with a tonnage of 68,517 tons, giving a return of 51,609,200 francs. In 1875 the increase was considerable, the number of the boats being 20,159, the tonnage 101,852 tons, the crews 68,651 hands, and the revenue 61,780,160 francs. The same year 178 vessels, with a tonnage of 30,295 tons, and manned by 7800 men, sailed from French ports to fish for cod on the coasts of Newfoundland; the year before the number of the boats engaged in cod fishing was 188. The average value of the Newfoundland fisheries is estimated at about 17 millions of francs. The rearing of oysters has of late made very great progress in France. Large beds are established on almost every suitable point of the coast, as at Cancale, Auray, Marennes, Oléron, and Arcachon. The last-named place is the most important of all, the beds being not fewer than 2427, which gave for 1876 a return of 3,941,309 francs, represented by 196,885,450 oysters 4,700,000 of which were shipped to England.

[1] The ton here and in what follows (as well as in the table) is the French metric ton of 10 quintals, which is about 33 lb less than the English ton,—the latter in commerce being held equivalent to 1015 kilogrammes.

Octroi.

In 1510 towns a duty is levied on goods, especially upon provisions and liquors, brought to market for public sale, or disposed of privately. In 1871 the total revenue yielded by this tax, which is known by the name of "*octroi*," was 156,490,935 francs, divided as follows:—

	Francs.		Francs.
Wines	48,427,924	Fuel	17,704,919
Cider	2,771,743	Fodder	7,906,196
Spirits	8,997,298	Building materials	7,891,322
Other drinks	15,624,090	Miscellaneous	5,319,968
Provisions	41,847,475		

The following table shows the returns of the octroi tax, in the towns where it yielded more than 1 million of francs for the years 1874 and 1876:—

	1874. Francs.	1876. Francs.
Paris	98,896,890	124,238,118
Lyons	8,570,618	11,138,497
Marseilles	6,228,699	9,782,279
Bordeaux	3,670,979	4,267,331
Lille	2,971,308	1,317,053
Nantes	2,041,361	2,309,377
Toulouse	2,471,514	2,904,121
Rouen	2,883,526	3,499,820
Le Havre	2,309,623	2,484,347
St. Étienne	2,269,951	2,847,545
Rheims	1,002,037	1,072,340
Roubaix	1,138,525	1,350,249
Nîmes	996,914	1,095,857
Amiens	957,925	1,107,082
Angers	870,540	1,096,869
Nancy	1,095,856	1,363,654
Limoges	958,555	1,140,029
Toulon	1,076,139	1,207,100
Nice	1,087,901	1,277,581
Rennes	1,004,110	1,148,469
Tours	778,876	1,023,582
Versailles	1,089,532	1,146,738
Grenoble	896,999	1,049,734

This tax is far from being uniform, the percentage in some places, as Paris, being as low as 4·76 francs for every 100 inhabitants, and in some others, as high as 13·55 (Amiens), 14·15 (Rouen), 14·98 (Bordeaux), and 15·56 (Versailles). It is fixed by a decision of the municipal council, subject to the sanction of the legislative chambers. If the average of the tax be reckoned at 10 per cent. of the value of the goods liable to it, the returns would show that such goods have a value of about 16 millions of francs, not including, of course, the considerable trade which is carried on in places where no octroi has been yet established.

Foreign trade.

Although the principles of free trade are now better understood in France than they were formerly, and are generally considered by French economists and statesmen as most conducive to the interests of a nation, their application is still far from complete, owing to the enormous charges brought upon the country by the late war, but chiefly to the personal influence of M. Thiers, the first president of the republic, who was a determined upholder of protection. This is not the place to enter on any discussion of the merits of the two opposite doctrines; but the fact does not admit of question, that notwithstanding the tax on raw materials and other duties which hamper the commercial intercourse of France with other nations, her foreign trade has been constantly increasing. The imports amounted in 1875 to 3,537,000,000 francs, and the exports to 3,872,000,000 francs (goods in transit not being included in these numbers), which is an increase of 24 millions for imported and 171 millions for exported goods over the year 1874. In 1869 the value of the imports was 3,153,100 francs, and that of the exports 3,074,900 francs. Foreign goods weighing 1,988,770 quintals (195,938 tons) entered and left France in transit during the course of 1875, showing a decrease of 318,745 quintals as compared with 1874. The principal articles of this class are silk goods (value 137 millions of francs), cottons, woollens, jewelry, gold and silver plate, mats, manufactured leather, corn, coffee, etc. The commercial transactions of France with foreign countries and her own colonies are shown in the following table, the returns being those of 1875:—

IMPORTS.

Countries.	Value. Francs.
England	624,300,000
Belgium	439,200,000

Bolivia	400,000
Mayotte, Nossi-Bé, etc	300,000
Siam	200,000
	3,872,600,000

The whole export and import trade, along with the salt tax, brought in the same year to the custom house a return of 267,907,791 francs, divided thus:—

	Francs.
Import duties	228,457,837
Export duties	353,013
Droits de statisque	5,844,999
Navigation duties	4,717,688
Accessory duties	3,985,645
Salt tax	24,907,791

The foreign trade is for a great part carried on by sea. France, however, has a very limited number of trading vessels; and foreign ships, chiefly English, convey about two-thirds of her goods, both imports and exports.

With regard to the nature of the goods, the values of the imports and exports (1875) were as follows:—

IMPORTS.

	Francs.
Silk and floss-silk	330,100,000
Wool	326,500,000
Raw cotton	321,300,000
Hides, skins, and furs	203,300,000
Coals	183,200,000
Common woods	164,100,000
Corn	138,600,000
Cattle	111,600,000
Coffee	105,100,000
Flax	90,500,000
Oleaginous grains	90,500,000
Cotton stuffs	84,400,000
Woollen stuffs	78,100,000
Foreign sugar	58,400,000
French colonial sugar	51,200,000
Cotton yarns	42,600,000
Vegetable oil	42,600,000
Tanned hides	42,200,000

Banks.

Besides the two banking companies especially founded with a view to assist agriculture, of which notice has been taken under that heading (*crédit foncier, crédit mobilier*), there are other establishments of credit which partake of the nature of public institutions, and must not be passed over in silence when speaking of French trade. The first of them is the *Banque de France*, founded in the year VII. (1799), and definitely organized by the law of the 26th April, 1806, which gives the management

of the bank to a governor and two deputy governors appointed by the chief of the state, and assisted by a council of fifteen *régents* and three *censeurs* elected by the shareholders. The capital of the Bank of France is 182,500,000 francs. Besides issuing bank notes, which circulate as freely as gold, the bank has the power to discount bills and letters of exchange at three months, when endorsed by three signatures; to collect bills payable given to it by private persons or commercial houses for that purpose; to receive deposits and open current accounts; and to keep in trust the coupons, deeds, silver and gold bars, bullion, and jewels which may be entrusted to it, at the rate of one per cent. per annum. The Bank of France has now a branch in each department. In the following towns, Bourg, Cahors, Tarbes, Aurillac, Mende, Tulle, Digne, Belfort, Foix, Gap, Mont-de-Marsan, La Roche-sur-Yon, and Meaux, these branches are not yet open; but the law has been passed, and their being opened is only a question of time. This establishment is the great instrument of credit in the country. It has more than once supported the Government by loans in difficult circumstances. The Government, which holds a great number of its shares, is therefore interested in its preservation, and, when money is unusually scarce, gives to its notes the value and privileges of coin, by decreeing what is called the *cours forcé*. This measure was resorted to during the late war, and confidence in the bank remained unshaken. During the year 1876 the quotation of the shares of the Bank of France fluctuated between 3875 and 3470 francs. Of other banks the *Comptoir d'Escompte*, which dates from 1848 and was reorganized in 1854, the *Société générale de Crédit industriel et commerciel*, founded in 1859 after the model of the London joint stock banks, the *Société générale pour favoriser le développement du Commerce et de l'Industrie en France*, established in 1864, whose special feature is to endeavor to make the use of cheques popular in France, and the *Caisse des Dépôts et Comptes courants*, are also worth mentioning. Among the local banks, the *Crédit Lyonnais*, the Colonial Banks, and the Bank of Algeria may be named, as the most important.

Coinage.

The coining of money is carried on by private contractors under the strict superintendence of the state. There are now in France six *hôtels des monnaies* (mints), in Marseilles, Bordeaux, Lille, Lyons, Paris, and Rouen respectively. Paris is the chief centre, and the other mints hardly now issue anything except copper coins. From 1795 till the 1st January, 1874, the quantity of gold and silver moneys coined in France was as stated below:—

GOLD.[1]

	Value, francs.
Coins of 100 francs	44,346,400
" 50 "	46,568,700
" 40 "	204,432,360
" 20 "	6,273,174,360
" 10 "	965,051,690
" 5 "	210,947,190
	7,744,520,700

SILVER.

	1795–1871.	1872.	1873.
	Value, francs.	Value, francs.	Value, francs.
Coins of 5 francs	4,685,641,250	389,190	154,649,045
" 2 "	70,512,344	7,547,588	1,056,152
" 1 "	86,998,118	15,958,333	19,101
" 0·50 centimes.	40,480,856	2,943,258	545,862
" 0·20 "	2,504,728		
	4,886,137,296	26,838,369	156,270,160
Total, 5,069,245,825 francs.			

This amount (with 307,232,889 francs value re-coined) is apportioned thus among the different governments which have ruled France during the period specified:—

	Gold.	Silver.	Total.
	Value, francs.	Value, francs.	Value, francs.
First Republic	.....	106,237,255	106,237,255
Bonaparte and Napoleon I.	528,024,449	887,830,055	1,415,854,495
Louis XVIII.	389,333,060	614,830,110	1,004,163,170
Charles X.	52,918,920	632,511,320	685,430,240
Louis Philippe	215,912,800	1,756,938,333	1,972,851,133
Second Republic	427,282,860	459,248,282	886,531,142
Louis Bonaparte and Napoleon III.	6,151,961,600	626,294,792	6,778,256,392
Third Republic	50,169,880	221,505,707	271,675,587
	7.815,603,560	5,305,395,854	13,120,999,414

[1] It is to be remarked that no gold money was coined in 1872 or 1873.

Measures, Weights, and Money.—The basis of all French measurements is the *mètre*, the length of which is the ten-millionth part of the arc from the pole to the equator. Multiples of this, increasing by tens, are expressed by Greek prefixes (the decametre, hectometre, and kilometre being 10, 100, and 1000 metres respectively), while the subdivisions have Latin prefixes (the decimetre, centimetre, and millimetre being $\frac{1}{10}$, $\frac{1}{100}$, and $\frac{1}{1000}$ of a metre). Similar decimal systems are formed from the other units of measure. The *are* is 100 square metres, and the *litre* the thousandth part of a cubic metre. The *gramme* is the weight of a cubic centimetre of distilled water at 4° C. (its maximum density). The measures in common use are here given, with their English equivalents:— Measures and weights.

Lineal Measure	Metre	= 39·3707904 inches.
	Kilometre	= ·6213824 mile.
Square Measure	Hectare	= 2·471143 acres.
	Kilometre carré (100 hectares)	= ·386116 sq. mile.
Capacity	Litre	= 1·7607734 imp. pints.
	Hectolitre	= 22·0096677 gallons.
Weight	Gramme	= 15·43234 grains troy.
	Kilogramme (or kilo).	= 2·20462 lb avoird.

In commerce 10 kilos = 22 lb, but 1015 kilos = 1 ton.

Money is reckoned by the franc of 100 centimes, in value a little over 9½d. £1 sterling = 25 francs. For recent statistics see Supplements. Money.

XIV. *Colonies.*

Algeria is the most important colonial possession of France. Its extent, between the Mediterranean in the north, Tunis in the east, Morocco in the west, and the Sahara in the south, is about 47,000,000 hectares (181,474 square miles), 4,597,000 hectares of which are peopled by 1,132,414 inhabitants, ruled by the ordinary laws of the mother country. A part of the rest is divided into *douars*, dependent on regularly administered *communes*, 166 in number. This portion extends to 1,511,000 hectares (5834 square miles), with 555,807 inhabitants, 127,321 of whom are French, 32,660 Jews, 113,018 foreigners, and 282,808 Mussulmans. Another portion of the *douars* is administered by French functionaries, either civil or military, assisted by native and European councillors; the territory under civil authorities measures 3,086,000 hectares (11,915 sq. miles), and contains 576,007 inhabitants; 9888 are French or naturalized Jews, 1683 foreigners, and 567,036 Mussulmans. Finally, 32 communes are still directly managed by native chiefs, although their authority is subordinate to that of French officials; the number of inhabitants is 1,219,285, 1747 of whom are French, 93 Jews, 649 foreigners, and 1,216,796 Mussulmans. Algeria.

The European colonists who have settled in Algeria number about 117,175. They have received from the state (1875) 565,000 hectares (2181 square miles); they have bought from the natives 260,000 hectares (1004 sq. m.), and 130,000 hectares (502 sq. m.) have been conceded to the *Société générale Algérienne* and to the *Société génévoise*. The budget of Algeria in 1876 amounted to about 27 millions of francs, of which two-thirds was devoted to public works or works of general interest. In 1869 the surface of ground under tillage was 1,684,000 hectares (6502 sq. m.), which produced 10,676,500 quintals (1,051,871 tons) of grain. In 1874, 2,950,000 hectares (11,390 sq. m.) gave a harvest of 16,676,290 quintals (1,642,984 tons), more than two millions of which were exported, representing a value of about 40 millions of francs. Vineyards occupied a surface of 11,360 hectares (28,072 acres), without taking into account the plantations made by the natives, and yielded 230,000 hectolitres (5,062,236 gallons) of wine; in 1866 this crop did not give more than 99,000 hectolitres (2,178,957 gallons). The importance of the cultivation of flax has doubled during the last five years, this plant covering now about 9000 hectares (22,240 acres) of ground. The same progress is to be noticed everywhere; thus the last census (1874) showed that there were in Algeria about 4,500,000 head of cattle and 10 millions of sheep, double the numbers returned in 1869. Algeria contains mines of iron, copper, lead, and zinc, which give a produce of about 600,000 metric tons, of a value of 7 millions of francs at least,—that is, a fifth part of the production of those metals in France. Alfa (a plant which gives excellent material for the manufacture of paper) and tobacco are the other prod-

ucts of importance. Alfa was exported in 1874 to the extent of 45,000 metric tons, 72 per cent. of this being sent to England. About 9000 planters are engaged in the cultivation of tobacco, which gave in 1875 a crop of more than 4,300,000 kilogrammes (84,629 cwt.), representing a value of about 3,300,000 francs. See ALGERIA.

Other colonies.

The other colonies of France are—in Asia, Pondichéry, Karikal, Mahé, Yanaon, Chandernagor and Surate, and the French Cochin-China; in Africa, Senegal, with the island of Gorée, the island of Réunion or Bourbon, the islands of Sainte-Marie de Madagascar, Mayotte, and Nossi-Bé; in America, Martinique, Guadeloupe, St. Barthélemy, French Guiana, and the islands of St. Pierre and Miquelon; in Oceania, the Marquesas Islands, Tahiti, and New Caledonia. Among these settlements, Martinique, Guadeloupe, La Réunion, and Guiana are, properly speaking, the only colonies, the rest being rather mercantile stations, except perhaps the French possessions near Madagascar and in the Pacific Ocean, which have better prospects, and one of which, New Caledonia, now contains the principal penitentiary establishments maintained abroad by France.

All these colonies submitted, till 1861, to what was called the colonial pact, which bound them to France so closely and jealously that they could trade with no other nation than the mother country. This state of affairs has been greatly changed, chiefly for Martinique, Guadaloupe, and La Réunion; and but for some privileges of navigation and some special taxes, trade with the colonies is almost as free as trade with France itself.

Produce and trade of colonies.

An account of the colonies of France will be found under the particular headings. It is only necessary here to give some statistical information about their produce and trade, so far as it concerns the general state and interests of French commerce.

The island of Martinique specially produces sugar canes; they were cultivated in 1874 on a surface of 19,314 hectares (47,727 acres), more than a third of the entire area of the island, and yielded a return of 38,653,000 francs. Cocoa trees came next, covering 262,000 hectares of ground (647,539 acres), and giving a crop of 284,000 francs; then coffee, planted on 210,000 hectares (518,940 acres), representing a yearly income of 203,000 francs; and lastly, cotton, which occupies only 42,000 hectares (103,788 acres) and does not bring more than 34,000 francs. The foreign trade amounts (1874) to 61,810,481 francs, 28,398,309 francs for imports, and 33,412,172 francs for exports. In these totals the trade with France amounts to 36,700,560 francs.

The large island of Guadeloupe, with its dependencies La Désirade, Les Saintes, and the French part of St. Martin, imported in 1874 goods to the value of 24,526,212 francs, and exported 22,470,302 francs value, making a total of 46,996,414 francs, to which trade with France contributed 27,825,183 francs. The value of the natural produce is as follows:—sugar canes (20,686 hectares or 51,100 acres), 40,775,732 francs; coffee, 676,846 francs; cotton, 35,470 francs; coooa trees, 120,300 francs.

Cod fishing is the principal industry of the islands of St. Pierre and Miquelon. The imports amount to 8,285,416 francs, the exports to 10,825,336 francs, and the trade with France to 9,913,532 francs.

French Guiana (Cayenne), which also contains penitentiary establishments, produces the same articles of trade as Guadeloupe, as follows:—coffee to the value of 48,028 francs; sugar canes, 243,984 francs; cocoa trees 52,430 francs; cotton, 1750. Its trade with France amounts to 4,914,002 francs; its imports to 6,571,067 francs, and its exports to 681,211 francs.

La Réunion or the island of Bourbon produces sugar canes to the value of 34,474,825 francs; coffee, 294,850 francs; tobacco, 494,100 francs; cocoa trees, 43,959 francs. The imports amount to 24,819,421 francs, and the exports to 30,219,829 francs. The trade with France is 34,869,267 francs.

The imports of Senegal (St. Louis and Gorée) amount to 12,134,631 francs, the exports to 16,628,069 francs, and the trade with France to 16,346,032 francs. The chief articles of trade are gum, gold powder, wax, ivory, a kind of vegetable oil, and valuable woods.

For Mayotte, Nossi-Bé, and Sainte-Marie de Madagascar the value of the imports is 4,080,229 francs, and of the exports, 3,773,280 francs. The trade with France amounts to 2,973,941 francs. The principal productions are sugar (5,088,750 francs), rice (1,799,008 francs), rum (334,480 francs), and coffee 11,275 francs).

For the French establishments in India (Pondichéry, Karikal, Yanaon, Mahé, Chandernagor, Surate) the imports are 6,675,583 francs; the exports, 17,671,100 francs; and the trade with France, 7,600,116 francs. Pondichéry and Rarikal are the most important centres of cultivation, the former having 19,835 hectares under culture, which produce 1,494,714 francs, and the latter 9114 hectares yielding 1,122,525 francs.

The imports of French Cochin-China amount to the value of 67,044,022 francs, and the exports to 88,011,123 francs. This settlement comprises extensive cultivated grounds, distributed thus: rice, 279,703 hectares; fruit trees, 32,989; vegetables, 30,938; sugar canes, 8052; water palm trees, 5640.

In Oceania, the returns for the Society Islands, Tahiti and Mouréa, are—imports, 3,458,735 francs; exports, 3,112,989 francs; and trade with France, 562,369 francs.

For New Caledonia the returns are—imports, 12,561,577 francs; and exports, 880,970 francs. This large island might afford an extensive and profitable field to the enterprise of colonists, but it has hitherto been too much neglected by the Government, which considers it almost exclusively as a penal settlement, and has not even taken the necessary steps to secure the few plantations around the town of Nouméa against the inroads of the native tribes, who still possess the greatest part of the country.

France has lately acquired from Sweden the island of St. Barthélemy, in the Antilles. It is an islet of 25 kilometres (16 miles) in circumference, without drinkable water. This acquisition was made, it is reported, with the view of founding there a new penal settlement less distant from the mother country.

PART II.—HISTORY.

I. INTRODUCTORY.

Early inhabitants of Gaul.

The extinct tribes which once thinly peopled the soil of France have left but scanty traces of their existence in the weapons and ornaments dug out of gravel-beds and river-courses. However interesting they may be to the student of ethnology and of the origin of man, they find no place in history; for neither in blood, nor manners, nor speech have they left any mark on the land they inhabited. Very different are those tribes whom Cæsar met when he first entered Gaul. The history of France may well begin with the words which open his famous chronicle—"Gaul is all divided into three parts."

Iberians.

Of the inhabitants of these divisions, the Belgians, Gauls, and Iberians, the third were in all ways different from the others; for the Iberians were a race of other origin, shorter, darker of complexion, less sociable, less bright, of more tenacity, possessed of that power of resistance which those whom stronger races drive out of the plains into the mountains quickly learn. On the northward and southward slopes of the Pyrenees, amid the fastnesses of that great chain, and in the Basque provinces of Spain, this race still dwells, easily discerned by characteristics of speech and appearance, which mark them off alike from Spaniards and Frenchmen.

Belgians and Gauls.

The Belgians and the Gauls were blood-relations. The former, dwelling chiefly in the northern districts of France, were later comers than their kinsmen the Gauls, stronger men and of a finer development. The Gauls, the men of central France, were a bright intelligent people, full of vivacity, frank and open of disposition, brave and scornful of tactics, as though all strategy were a lie and a disgrace. The Belgians seem to have been more staid, less active, less easily cast down, more thoughtful; they were not without a physical and moral resemblance to their neighbors and distant cousins the Germans. From these two tribes has sprung the modern Frenchman, who to this day, according to his part of France, bears the mark and sign of one or other origin.

When Julius Cæsar entered Gaul (58 B.C.), he found these natives in a half-barbarous state, split up into clans, each with its elected chieftain, its Druids or priests, and its body

of warriors or horsemen; while below these was an undistinguished company of servile men, women, and children, who did all works of peace for their idle fighting aristocracy. Each clan lived to itself, with little or no power of combining even with its nearest neighbors. Its home was usually an open village of circular wattled huts, with one family dwelling in each hut. Sometimes, in places of strength and importance, the Gaul built himself a fortified town enclosed by earthworks, perched sometimes, like Alesia, on a strong hill-top, or entrenched in dark recesses of wood and marsh. The more close the tightening of the Celtic clanship, the more completely did each little community live to itself, apart from other clans; so that in spite of the great difficulties of the country, Cæsar found the reduction of it a tolerably easy task.

Before Cæsar's days Gaul had already known something of foreign invasion. On her northern and eastern frontiers were the Germans; in the south stood the Greek city of Massilia, the ancient rival of Carthage; and in 122 B.C. Caius Sextius had founded the town which bore his name, Aquæ Sextiæ, now Aix in Provence, whence, as from a centre, the Roman occupation spread through the district watered by the Rhone and its tributaries, until it received the name of Gallia Braccata, and became a province of the republic. Narbonne (Narbo Martius, founded 118 B.C.) was the new capital of the district, the first Roman municipium on the soil of Gaul. But invasion took an entirely new character when Cæsar was made proconsul (59 B.C.). He entered on his great conquest in the following year, and the reduction of the whole country was complete by 50 B.C. In the course of those years the great Roman penetrated to the utmost limits of Gaul, beat down all opposition, crushed the Helvetians back into their Swiss home; he defeated the Germans who had made secure lodgment in the Sequanian lands, and drove them into the Rhine; broke the resistance of the Nervii, all but exterminating that gallant tribe; severed the connection between Gaul and Britain, on which the Armoricans especially relied, by two expeditions across the Channel, in which he gained a great addition of glory, if little fresh power; the conquest of far-off Britain fired the imaginations of men: finally he brought the long wars to a close by the submission of Vercingetorix under the walls of Alesia.

Cæsar in Gaul.

Thenceforward Cæsar, having conquered the Gauls, became their emperor. He saw what boundless supplies of force, of enthusiasm and intelligence, were now at his disposal; with Gallic support and his own devoted legions, he was now able to give law to Rome herself. Meanwhile, he did all in his power for Gaul,—lightened her tribute, mitigated slavery, forbade human sacrifices, repressed the Druids. The country lost its independence, and became the docile pupil and follower of Roman civilized life.

For more than four hundred years the Roman domination influenced Gaul. At the beginning of the time the natives were savages, dwelling in a wild land of forests and wastes, a thinly scattered company of unsociable clans, without towns or roads or industries; at the end they had fine cities, and much cultivated land, wore the Roman dress, had adopted the Roman law, and had exchanged their own tongue for a new form of the common Latin language.

Augustus.

After the murder of Julius Cæsar, the administrative genius of Augustus found wide scope for its activity in Gaul. Lyons was the new capital, whence his four great roadways and his civilization radiated out in every direction. Several of the later emperors vied with him in their interest in Gallic affairs: Caligula spent much time at Lyons, and, in his grotesque way, encouraged letters there; Claudius was a native of that city, and threw open the senate to the Gallic chiefs; he established schools, emancipated slaves, and taught the Gauls the equality of all men under the law; Nero, with his Greek sympathies, delighted in Provence, though he cared little for the rest of the country—then called "Imperial" Gaul. All through this period new ideas, new pleasures and efforts, characterize the life of Gaul; and after the fall of Civilis in 70 A.D., no one in all the country dreams of any further struggle in behalf of the independence she had finally lost.

Christianity in Gaul.

All things were now preparing for the next great influence which should affect the Gallic race. For nearly a century, though Gaul and Rome seemed together to tread the downward path towards ruin, the Roman ideas as to justice, law, and order, were fitting the Gallic mind for the reception of Christianity. And Christianity soon came. In 160 or 161 A.D. we find a bishop of Lyons, Pothinus, and with him the well-known name of Irenæus. These men ministered at first to Greek and other settlers, for the early church of Lyons long bore marks of a Greek not a Latin origin. Gradually, however, the life-giving ideas and doctrines of Christianity spread abroad among the Gauls, and churches sprang up at Autun, Dijon, Besançon, and other towns within comparatively easy reach of Lyons. Roman Christendom, however, did little for Gaul till the middle of the 3d century (244 A.D.), when seven Latin bishops were sent thither, and formed new centres of Christian life in the land at Limoges, Tours, and even Paris, whither came Dionysius with a little company of brethren in 251. Henceforward Christianity spread swiftly; and though in the next century St. Martin of Tours still found heathen temples to overthrow and multitudes of country pagans to convert, still we may say generally that in three generations from the time of the Roman mission of 244 A.D. all Gaul had embraced the Christian faith.

These were also the days of what is called "the Gallo-Roman empire;" of the provincial emperors who strove to sever the Eastern from the Western world. Along her northern frontier also Gaul saw the establishment of the two Germanies, districts on the left bank of the Rhine, where German warriors held their lands by feudal tenure of the sword. Thus as Gaul herself languished under the loss of her independence and the influence of the moral corruption of Rome, she began to become aware of the two powers which were destined to mould her character—the Christian Church, and the fierce Germans. They advance upon her from south and north; when they meet, the Gaul bows the head before them, and in new union the feudalism of the Teuton and the Christianity of the Latins begin their task of education. The combination of the institutions of Germany with those of the church forms the basis on which the history of France is reared.

The Germans.

The Germans, who now began to overrun the soil of Gaul, were a very different race from those with whom they came into contact. Stronger and larger in frame, they were also more stable and enduring than the Gauls. Far back they claimed the same ancestry; in language and in personal characteristics alike we can trace the connection. Yet, thanks to climate and circumstances, the two races were by this time completely severed, alien in speech, ideas, institutions, and tastes. The German was a hunter, a man of independence of character; the Gaul lived in his clan, and shrank from personal freedom; slaves were unknown in Germany, while they swarmed in Gaul; the Gaul had an organized faith, a regular hierarchy between him and the supernatural; the German worshipped, independent and alone, without human mediator, in the depths of his forests. The fighting-men who grouped themselves round a German chief were his free comrades, connected with him only by a personal tie, each prepared to act independently if his time came, and to build up for himself a lordship of his own. On many sides these men now began to press into Gaul. The Goths, after wandering apparently from Scandinavia to the Black Sea and thence into western Europe, settled down,—the Ostrogoths in Italy, the Visigoths in Spain and southern France. The Burgundian Vandals, from Low Germany about the Elbe and Vistula, now began to stream over into eastern Gaul, giving their name to a large district of the country; the Franks, an aggregate of northern tribes, Low Germans of the centre and the west, were destined to be the chief conquerors of the land, the authors of her modern name.

Church organization.

But before the German had become master of Gaul, the Christian Church had already firmly established itself. Thanks to the support he received from Christianized Gaul, Constantine was enabled (312 A.D.) to enter Rome in triumph, and to assure the victory to the church in her struggle against paganism Henceforth the church, which had always endeavored in her organization to copy the civil power, was officially modelled on the lay institutions of the later empire; her dioceses corresponded in position and extent to those of the civil administration; the chief clergy became important magistrates. The bishop of each city with his clergy took the place of the older curials, the members of the civil municipality; the old relations of church and state were profoundly modified by the rise of the bishop of Rome to

the position of supreme pontiff, a title given up by the emperor. In the downfall of Roman society in the fourth century, the clergy alone retained some power, and showed promise of the future. The lay power struggled hard for a while against the German invasion, specially against the Franks; the church stayed in the cities, secure and growing stronger against the day when she too would have to face the invader, and to convert him from a heathen foe into a firm ally and friend.

In the 5th century the Germans ceased to plunder and ravage, and began to settle; it is the age in which Gaul exchanges her Latin for her Teutonic masters. Early in the century a vast horde crossed the Rhine on the ice in mid-winter, and streamed over northern, central, even southern Gaul, passing thence a little later into Spain.

The Visigoths.

In 412 Ataulf the Visigoth settled down in the valley of the Rhone, and allied himself with Rome; the Burgundians also occupied the Sequanian lands. These two tribes were friendly towards the older inhabitants, and were recognized as peaceable settlers by the imperial power; they showed that they deserved well of the falling empire by the gallant and successful resistance with which in 450 the Visigoths and Gallo-Romans defeated the terrible hordes of Attila at Chalons-sur-Marne. Yet the empire thus saved for a time could not be saved from internal decay; confusion reigned throughout Gaul, the Germans and the Gallo-Romans struggling as it were in the dark for possession; and when in 476 the empire of the West finally went under, Ewarik (or Eurie), the prudent Visigoth, was left as master of all that had belonged to Rome beyond the Alps towards the west. The Arian Goths, with Toulouse as their capital, might have secured their authority over all France if the church had accepted the views of Ewarik, and if that vigorous prince had lived. He died, however, in 485, leaving behind him only a weak boy as his successor; and far to the north the fierce Frankish warriors had already taken as their chief the youthful Hlodowig (Clovis). The Franks, a loose confederation of Germanic tribes, were in existence in the third century on the right bank of the Rhine, and for a long time showed no wish to migrate into Gaul. By degrees one of these tribes, the Salians, headed by a family called the Merewings or Merwings (the Merovingians), began to take the lead; they soon made themselves formidable by their incursions on northern Gaul, and established themselves masters of the left bank of the lower Rhine. As the Roman power declined along that district, their authority increased; early in the 5th century they had spread from the Rhine to the Somme. Another leading tribe of Franks, the Ripuarians, whose home lay on the Rhine about Cologne, less tempted towards Gaul, seemed to hold themselves in reserve for the future.

The Franks.

Hlodowig or Clovis.

In 481 Hilderic, chief of the Salian Franks died, leaving behind him a boy of fifteen, Hlodowig or Clovis. This youth, endowed with unusual vigor and fierceness, soon won a great reputation among the Franks, and in 486 broke in on the only Roman power now left in northern Gaul, the degenerate legions commanded by the patrician Syagrius of Soissons. These were swept away like the autumn leaves before the wind, and Hlodowig settled down in the lands which he had won. Here he at once came into contact with Christianity; Remigius bishop of Rheims becoming his friend and adviser long before he adopted the Christian faith. It was probably through his influence that the young king married Hlotehild, niece of the Burgundian king, a Christian maiden. In the quiet years which followed Hlodowig doubtless became more and more inclined towards his wife's belief; and when, in repelling the invasion of the Allemans in 496, he believed that the "god of Hlotehild" had heard his vow, he at once declared his gratitude and his conversion. Some thousands of his wild warriors followed him to the font, as willingly and with as little thought as they would have followed him to death or victory. From this moment the firm alliance between the church and the Frank began, an alliance which affected both; the church became more warlike and aggressive, the Frank grew more civilized, and learnt the art of ruling.

With their headquarters fixed in northern Gaul, the Franks, under Hlodowig's command, reduced first their cousins, the Burgundians (500 A.D.) and then (507) the Visigoths under Alaric. All France, with exception of a rich strip of land between the mountains and the Gulf of Lyons, afterwards called Septimania, was overrun and plundered. This done, Hlodowig spent the rest of his days securing his dominion by the destruction of all powerful neighbors or competitors; for the grim Frank, vigorous and ambitious, knew neither scruple nor pity, and the clergy round his throne passed over crimes which they were powerless to prevent. When he died in 511 the settlement of the German on the soil of Gaul had been accomplished, and Hlodowig, who has no claim to honor as a man of constructive power, still stands out in history as the founder of a new world in France. To him France owes that feudal relation which has so deeply marked her story; in him the church first made that connection with feudalism which lowered her character, while it strengthened her power and influence. Not without reason does France inscribe on the first page of her history this German conqueror, a robber, a liar, a murderer,—for it is from him that modern France rightly dates her beginning.

Feudalism.

The origins of feudalism are simple enough. When the Franks came in under Hlodowig, they were a host of free and equal Germans under the king of their choice. The belief that he brought with him a graduated hierarchy of chieftains, who at once established a complete "feudal system" on the conquered soil, is no longer tenable. No doubt the most influential and vigorous of Hlodowig's followers got most in the distribution of lands and spoils; still, in theory at least, all free Franks were equal, and in the new settlement of the country each man according to his strength took what he could get. The older conditions of the Germanic peoples had died out of the Salian's life; the institutions which appear in an indistinct form in the *Germania* of Tacitus had already undergone great change; the family of tribes, with common rule of usage and very slight bonds of political union, is, as Professor Stubbs remarks (*Constitutional History*, i. p. 36), "singularly capable of entering into new combinations; singularly liable to be united and dissolved in short-lived confederations." It was one of their late-formed confederacies over which Hlodowig, with the vigor of barbarous youth, had now come to rule. The Salian law, a collection of the customs of Frankish law in the 5th century, gives us a fairly clear view of the condition of those who streamed over into Gaul at this great chieftain's back. We learn from it that among the Franks the kingly office was fully recognized, and though the form of election by the nation is preserved, the choice is limited to the members of a single family, so that hereditary succession partly prevails. The king, once chosen, is the real head of the nation; he has not as yet run any risk of becoming a *fainéant*; he appoints the rulers of provinces, if we may use this Roman term,—that is, the grafs who are set over certain aggregations of hundreds; and the graf or reeve, to take the English form of the word, is an administrative officer, who carries out the sentences of the courts of justice. The king also appoints the officers who collect the royal dues in the "vills" which had succeeded in the place of the primitive "marks" of the Germanic peoples. Round the king's person is his "comitatus," his aggregate of immediate followers, who form his guard, and are the germ of the later feudal nobility. The nation in arms forms the equal council, in which all men give voice and vote alike; justice is administered by a hundred-court or mall, composed of qualified landowners; if any one is aggrieved by their decision, he can appeal directly to the king. It is round this "hundred" that the Frankish system really moves, for it is out of a group of hundreds that a district with its graf is formed; and there seems to be no court of law superior to that of the hundred. All political questions are of course the affair of the national council. There is in the Salian law no trace of a primitive nobility; though the old system of common land has disappeared, giving place to separate ownership, the land does not carry with it any special honor; the Franks are still very far from any ideas as to a territorial nobility.

These were the institutions which Hlodowig transplanted out of the districts of the lower Rhine into Gaul. They came into contact with the tenacious Gallic temper, and the masterful organization of the Romans. The Franks, with singular energy and success, adapted themselves to their new place as conquerors; and, giving and taking, laid the foundations of modern French life. Their settlement was slow and unsystematic; the king, receiving a large portion

511-558. of the soil as his domain, granted out of it benefices for his immediate friends and followers. These gifts were at first held on pleasure, and were liable to be resumed at any time; after a while this precarious tenure suited neither party; these fiefs became first life-holdings, and finally hereditary possessions, held on tenure of service of some kind. The greater chiefs, with the king, took their share of conquered lands, asserting their rights to an alodial holding, and, if they chose to do so, granting out benefices from these districts to their followers. The common sort of Franks, who were neither king's friends nor independent chiefs and their friends, took what they could get, their share of the spoil as it fell to them; and as their strong arms were useful and marketable possessions, we may be sure that many of them grouped themselves round the king, and, if they were fortunate, were rewarded with small benefices. A considerable part of the land was left in the hands of the Gallo-Romans undisturbed, and became tributary—the tribute being a kind of rent paid by the old owners to their new masters.

Thus the Franks were spread over the whole surface of the soil; they were at home in the country, and shunned the cities; civic life was distasteful to them; the air of the streets too confined for those who loved the forest and the chase as all Germans did. Consequently, in the towns the Gallo-Roman bishops retained sole authority, ruling by the Roman law, and preserving the last remains of the civilization of the past. The church, however, was far from confining herself within these civic limits; though she stood aloof from feudalism at first, deeming her own ways better, she soon showed a consciousness that the centre of power no longer lay in the cities, and that her influence must be felt at the king's court. Consequently, we soon find the bishops grouping themselves round the king, acting as his advisers, modifying the Germanic ideas, and in turn receiving new ambitions from their masters. Ere long the bishops will begin to take place in the feudal hierarchy, and will form a recognized part of the new nobility of the realm; though for a very long time the Franks clearly regarded the clerical life as unsuited to their character, and left the influence and fortunes of the church entirely in Gallo-Roman hands.

Before Hlodowig died (511) he had destroyed all the old chieftains and knights who ruled in Gaul. He took the place of Roman and Goth; the Visigoth shrank away southward; the Burgundian became tributary; the Frank was recognized as undisputed master of all the country; the northern barrier lines between Gaul and Germany perished; as fresh bands of Franks poured into northern France from time to time, the Austrasian princes renewed the Germanic influence over Gaul; and for five centuries the history of France must be regarded as in most respects subordinate to that of Germany.

Partition of the Frank kingdom.

Germanic use prevailed in the new kingdom, and when Hlodowig was gone, his four sons all became kings, each representing one of the divisions of the original invasion. Theodorik, the eldest, took the north-eastern part, and became king of what ere long began to be called Austrasia; he lay on both banks of the Rhine, and was almost entirely German, with his capital at Metz. Hildebert, eldest son of Hlotchild, had the central district, the country round Paris, with Paris as his capital. Hlodomir, the next, was king of Orleans, and had western Gaul along the Loire. The youngest, Hlothar, was king over the old Salian land, the north-western corner of Gaul, with his capital at Soissons. The partition was a division of estates rather than of governments; the four kings regarded the country north of the Loire as their home, and divided out all beyond that river at will by arbitrary lines. As yet a king was little more than a leader in war, and his free men, his "leudes," looked to him to give them plentiful employment in that way, even compelling him at times to go on expeditions against his own better judgment. Thus it fell out that this first partition did not weaken the Franks; they attacked their neighbors on every hand. In one of these wars (in 524) Hlodomir, king of Orleans, was killed; his brothers seized his inheritance, and on Hildebert's death (558) Hlothar of Soissons became sole king of the Franks; in 555 he had taken possession of Austrasia. Hlothar's rule brings the name of

Neustria.

Neustria into prominence. The two branches of the Frankish power become clearly distinguishable,—the German Austrasians coming down to Lorraine, and including the eastern part of Champagne, as these districts were later called, and the Gallic Neustria covering almost all modern France. And Neustria settled quickly into a monarchy of more modern type. Round Hlothar were grouped his reeves or counts; the clergy made their court to him; the "leudes" now became the king's "trusty men;" not a few Gallo-Romans also held office under him.

558-598.

Second partition of Frankish kingdom.

On Hlothar's death (561) the Frankish kingdom was once more divided into four parts—Austrasia, Paris, Soissons, and Burgundy,—the eldest son, Sigebert (as in the earlier partition), taking the north-eastern country. When Haribert, king of Paris, died in 567, Hilperik, his brother, king of Soissons, seized his share, and became king of Neustria. And now the three Frankish kingdoms of Austrasia, Neustria, and Burgundy take definite forms. Speaking generally, Austrasia lay between the Meuse and the Rhine, Neustria between the Meuse and the Loire, though Austrasia trenched somewhat on Neustria on one hand, and stretched far up and even beyond the Rhine on the other side. Burgundy included the upper waters of these rivers, and of the Saone as well. The rivalry lay between the Austrasians and the Neustrians; the Burgundians, being the weakest and most peaceful of the three, sided sometimes with the one, sometimes with the other. This rivalry finds its expression in the half-legendary strife between the haughty high-born Brunhild, wife of Sigebert, king of Austrasia, and Fredegond, the low-born mistress of Hilperik, king of Neustria.

The mayors of the palace.

Before the end of the 6th century we discern a new power rising into distinctness,—the power of the mayor of the palace, an officer, as his name denoted, having great authority in the king's court, elected by the chiefs, and acting almost independently of his master. In Neustria we usually find the mayor of the palace siding with the royal power; in Austrasia, where the nobility were much stronger, he checks and overshadows the king; in Burgundy he is only an insignificant person, being of inferior importance to the patrician, whose office, as the name tells us, was a relic of past Roman days. Another, and a far more beneficial influence, also appeared at this time; the Benedictines came across from Italy, and spreading throughout France, formed many centres of fresh life in the confusion of the land. They revived the faith in industry, well-nigh destroyed by the Franks; they did something to rescue the older inhabitants from misery, and culture and letters, thanks to their well-directed energies, again raised their heads.

At the end of the century the two queens, Brunhild and Fredegond, were the two rulers of all the country; for Brunhild had charge of her two grandsons, Theodebert II., king of Austrasia, and Theodoric II., king of Burgundy while Fredegond governed Neustria for the youthful Hlothar II. So early does the extraordinary prominence of regency appear in French history. After Fredegond's death in 598, Brunhild seized on almost the whole of Neustria, and for a while seemed once more to unite the Merwing lordship under her rule. Her chief aim was the establishment of a solid monarchy in Austrasia, which should curb the power of the nobles; they, in opposition to her, placed at their head two brothers, Arnulf bishop of Metz, and Pippin of Landen, the ancestor of that great family under the auspices of which modern society laid its foundations in both Germany and France, the great Karling or Carolingian dynasty. Led by these two men, heads of the lay and spiritual aristocracies, the Austrasian nobles met the aged queen; her army deserted her, leaving her with her four great-grandchildren in the hands of Hlothar II., the nominal chief. He put the children to death at once, and after shameful indignities, the queen, it is said, was tied to the heels of a wild horse and so dashed to pieces. Her death was a triumph of aristocracy over monarchy. Hlothar II., now sole king of Franks, was entirely in the hands of the mayor of the palace, who became a real power in the state, representing the interests of the nobles as against the centralizing tendencies of the kings.

This victory of Neustria, though it paved the way for the eventual domination of the Carolings, was in itself "the triumph of weakness over strength, of the Gallo-Romans and the priests" (Sismondi). The victorious nobles endeavored to secure their supremacy. The bishops, who were now found sitting in the assembly of the "leudes," drew up

628-732. a new ordinance, a "perpetual constitution," a first attempt to substitute ideas of justice in the place of custom based on force. This, however, in the nature of things, could not check the growing power of the nobles, especially in Austrasia; though for a time royalty, under Dagobert (628–638) showed a good front in Neustria. In him the Merwing monarchy reached its highest point; his splendid court at Paris laid the foundations, not altogether sound ones, of the civilization of France. At his death his monarchy crumbled away. Children were kings in both Austrasia and Neustria; we reach the days of the "do-naught" princes, the *rois fainéants*, and of the struggle between the mayors of Austrasia and Neustria. Ebroin, the Neustrian, for a time held out against his rivals; but the Austrasians placed at their head the representatives of the Caroling family, Martin and Pippin, grandsons of Pippin of Landen; and, Ebroin having been assassinated, Neustria had nothing wherewith to resist the onslaught of the German Franks. Led by Pippin of Heristal, they burst into the valley of the Seine, and at Testry in the Vermandois, the long struggle of the two Frankish powers came at last to an end (687). There the Neustrians under Berthar, mayor of the palace to Theodoric III., were entirely defeated, and henceforth, though the line of Merwing kings lasts till 752, they become insignificant and powerless. We turn our eyes with pleasure towards the rising splendor of the Caroling house. France finds herself on the skirts of a new Roman empire, of which the seat is in Germany, and which in its main features belongs to German not to French history.

The Carolings.

To no small extent the Neustrian Franks had lost their old Germanic vigor before this time; perhaps among the chief symptoms of change is the fact that many Frankish names may be read among the upper clergy of the time. In the absence of sufficient evidence it is impossible to say how far they had condescended to learn the "rustic Latin" which the older inhabitants all spoke, the parent of the modern French language; still, there can be no doubt that they must have spoken it to some extent, if not as their sole speech. Now, however, the Austrasian conquerors began to bring things back to a German form. The ancient "Fields of March" are held again; thither come the warriors in arms as of old; German conceptions as to justice seem again to prevail over the more orderly Roman law. The new-comers are above all things an army; and it is the fortune of the Austrasians, not only that they have soldiers and love fighting, but that they have great captains at their head. From Testry (687) to the end of his life in 714, Pippin of Heristal was unquestioned master of all Franks, the kings under him being utterly insignificant. While he kept his Neustrian subjects submissive, he applied the enthusiasms of the sword and the cross to the wild Germans on his eastern border. Under him began the heroic labors of those English monks whose is the high honor of having first introduced the Christian faith among the pagan Teutons.

Charles Martel.

On Pippin's death things seemed likely to fall back into confusion; the Neustrians shook off the yoke of their German lords, and Austrasia was threatened at once from every side; Frisians and Saxons, as well as Neustrian Franks, overran the country, vainly opposed by Pippin's widow, Plectrude, who ruled in the name of her grandson, a child. Austrasia, however, was saved by the energy of Pippin's natural son Charles, whom Plectrude had thrown into prison, and who now emerged as a strong leader of the nobles. He defeated the Neustrians at Vincy, near Cambrai, in 717, repelled the Saxons from the Rhine, reduced Plectrude, who had taken refuge at Cologne, and became undoubted head of the Franks, as his father had been before him. His father's rise had been the work of the lay and spiritual nobility; the power of Charles was based on the sword alone; he was regarded by the churchmen as their foe; he took of their lands to reward his soldiers, punishing the noble bishops while he encouraged the more popular monks. Though the clergy treated his memory with vindictive anger, the lay lords were firm on his side, and enabled him to found the great dynasty of the Carolings. For it was their ready sword which won him the victory of Poitiers (or Tours), in which Europe set a limit to the advance of Asia, in 732. The Arabs, possessors of almost the whole of Spain, had for several years poured over the Pyrenees into southern Gaul; held in check a while by the vigorous Odo (or Eudes) king of Aquitaine, they proved at last too strong for him and he appealed to Charles to rescue him. The Franks responded nobly to the call, and in a few years Charles had driven the Saracens out of all their points of vantage north of the Pyrenees. It is said that to the battle of Poitiers Charles owes his name of "Martel," the Hammer, for the vigor with which he smote the Mussulmans. Other accounts have been given of this sobriquet, on the whole the common explanation of it is the most probable and the best supported. All the rest of his life this great duke of the Franks struggled against the pertinacious foes who attacked his frontiers. His power may be said to have been limited by the Rhine to the north and east, and by the Loire to the south. 732-771.

Just before his death he divided his dukedom between his sons Carloman and Pippin the Short. As usual, the elder had the Germanic share, but under the influence of Boniface, the English monk and missionary, whom he made archbishop of Mainz, he, after six years of successful rule, laid down the burden of power and became a Benedictine monk. His ducal rights he handed over to his brother Pippin who had become sole duke of Franks. His father and brother had opposed the power of the bishops by the help of the monks; it remained for Pippin to go a step farther, and linking together the monks with the papacy, to win for himself the name of king. The monks had been the papal militia for the conversion of Germans; the converted Germans in their turn became firm friends of the Frankish dukes. The head of the whole movement was St. Boniface the founder of the church in Germany; he it was who, acting under command of Pope Zachary, crowned Pippin king of Franks in the cathedral at Soissons. Pippin thereby became lord by a new title of the eastern and western Francia, or Frank-land, ruling over a large part of modern Germany and of modern France north of the Loire at least. The last of the Merwing shadow-kings, Hilderik III., was deposed, and thrust into the convent of St. Omer, where he shortly after died, and the race became extinct. On three sides Pippin was called to combat three powers, foes of his new royalty, foes also of the Church of Rome. The pagan Saxons did not detain him long: in one campaign he extorted from them the right to send his monks among them as missionaries; the rest he left to time. The Lombards, under their king Haistulf (Adolphus), had seized Ravenna, and threatened Rome herself, and Pope Stephen fled to Pippin for help. The Frank king crossed the Alps, and compelled Haistulf to give up to the Church of Rome the town of Ravenna, the Emilia, the Pentapolis, and the duchy of Rome itself. This is the famous "Donation of Pippin," the foundation of that temporal power of the papacy the end of which we have seen with our own eyes. The papacy raised up the Franks as their champions and defenders; they were set as a counterpoise to the grand claims of the empire at Constantinople, and as antagonists to enemies in Italy. No wonder if before long the papacy saw its advantage in the restoration of an empire of the West under new auspices, and if Germany in return willingly interfered in the affairs of Italy. The political life of modern Europe now begins. The rest of Pippin's reign was chiefly occupied with the resistance he found in southern Gaul. In 758 he took Narbonne, the capital of the Arabs, and drove the Mahometans out; he attacked the Aquitanians, who, after their wont, made tenacious resistance. On the death of their duke Waiffer, he overran their whole country, though he never occupied it permanently. Centuries must elapse before northern and southern Gaul could become one France.

Pippin the Short.

In 768 Pippin died at Paris, leaving his dominions to his two sons Charles and Carloman. In 771 Carloman also died, and Charles became sole king of Franks. The reign of "Charlemagne" is begun, the great German lord who in fact and legend filled all the world. The seat of his father's power lay, on the whole, in Neustria, and his chief struggles had been for dominion over Aquitaine; the seat of the power of Charles himself lay on or near the Rhine; his three chief palaces were at Engelenheim, Aix-la-Chapelle, and Nimwegen. His whole temper, history, relations, were strictly German; the part played in his life by Neustria and Aquitaine was, by comparison, insignificant, for Charles the Great belongs to world's history, not to the history of France.

Charles the Great.

771-814. His first task after his father's death was to complete the reduction of Aquitaine; for here war had broken out again when Pippin's death seemed to the southerners to give them their opportunity. Charles beat the old Duke Hunold in the field, and drove him to take refuge with the Lombards, where some time later he fell, helping to defend Verona against his and their hereditary foe. The struggle in Aquitaine, hopeless if vexatious, lingered on, until at last the wise king, as imperial ideas grew stronger in him, saw that his one hope of success with them lay in giving them an independent life of their own, under due restrictions. He therefore set over them his little son Hlodowig as king, and appointed William Courtnez, count of Toulouse, as his tutor. The child was established at Toulouse, and brought up as an Aquitanian. The south retained its distinctive characteristics, and was saved from the degradation of having to fall back to the lower level in art and civilization which prevailed among the Franks. The kingdom of Aquitaine had for its southern frontier the river Ebro in Spain, and crossing the mountains reached the open sea just below Bayonne; the northern frontier at first was less well defined; before the end of the 8th century it was pushed on as far as to the Loire.

And just as Hlodowig was established in Aquitaine, so in 776 Charles set his second son Pippin over the Lombards, thereby securing his permanent influence over the see of Rome. The papacy throughout leant on him for support, and was even content to recognize his supremacy. For a quarter of a century Charles's life was spent in ceaseless wars on every side, in which he slowly though surely beat down the resistance of heathen Saxons, of Huns, of Lombards, of Saracens. Within the limits of modern France, after the pacification of Aquitaine, the only war was that against the Armoricans, inhabitants of Brittany,—a slow, stubborn contest, which lasted till near the end of his life. For a short time Brittany became a portion of the empire, without, however, in the least losing any part of its independent character.

Charles crowned emperor.

By 796 Charles had secured his ascendency throughout Europe, so that when in 799 Pope Leo III. was ejected from Rome by the citizens, he fled to him for refuge and help; and Charles, in the autumn of 800, replaced him on the pontifical throne, receiving in return, on Christmas day, the solemn titles of Emperor of the Romans, Augustus; and certainly, if ever the great echoes of the past were to be awakened, they could not have been aroused for a worthier prince. "A Latin priest gave to a German soldier the name of that which had ceased to exist," says La Vallée. None the less was Charles a real emperor, ruling over subject princes; the Germans and the Romance peoples alike accepted his sway: and for fourteen years, with less of fighting and more of organization, Charles the Great proved that he was worthy of his high title and revived office of Emperor of the West. In 806 at Thionville he settled the succession to his empire; but as death bereft him of his eldest son Charles and his second son Pippin, he was obliged in 813 to make a fresh arrangement. He made Hlodowig, the one surviving son of his second wife Hildegond, his heir and successor, crowned him, and saw him saluted emperor. After this, he lingered a few months, and died early in 814 at Aix-la-Chapelle. It was doubted whether he should be buried there or at St. Denis, where his parents' bones had been laid. Austrasia, however, prevailed over Neustria, the Germans over the Frenchmen, and he lies at rest these thousand years past in the church he himself had built in the city he loved so well.

State of France in his reign.

The state of what is now France under his care was this. The land was cut asunder at the Loire; to the north of that river was Francia Occidentalis, the earlier Neustria and Burgundy; to the south of the Loire lay Hlodowig's kingdom of Aquitaine, governed by Roman law, and home of precious remains of Roman culture. In Francia Occidentalis were Frankish nobles, the clergy, the free Franks, the inhabitants of cities, and the slaves, the last in ever-growing numbers. The first and second of these classes soon began to secure their position as great feudal lords, half independent. They laid the foundations of that system of feudal noblesse which became almost omnipotent under the weaker Carolingian princes, which brought about the revolution placing Hugh Capet on the throne, which resisted the centralizing tendencies of the monarchy under Louis XI. and Louis XIII., which became the devout servants of the Great Monarch, and finally ended with the monarchy at the Revolution. The reign of Charles the Great is the time at which these nobles began to see that their strength was based on the land; their position grew more territorial, their allegiance and honors less personal. Charles endeavored to resist this tendency, but his hand could not be everywhere, and the nobles on the whole held their own, though so long as he lived they still bent before his power. 814.

The administration of Gaul at this time was in appearance fairly complete, though it doubtless often failed in its practical application. Handed down from former days, in the larger towns there were always two chief personages, the count and the bishop, of whom the former officer was of Frankish origin, the latter of Roman. To a considerable extent, as was the case throughout all early Christendom, the functions and jurisdiction of the bishops originally answered very closely to those of the lay power, the church-organization being copied from the organization of the empire. Now each of these greater officers had its own jurisdiction and court; each administered therein law, the bishop according to the Roman order, the count according to Frankish usage; and, though their functions might sometimes clash, on the whole they joined in preserving peace and quiet within the walls. The counts also attended to the war-force and collected the taxes; while the bishops, on their side, were charged with the teaching and the moral life of their flocks. Between them they preserved a considerable amount of municipal life and character in the ancient cities. Under the counts we find local officers whose business it is to hold lesser courts in the bourgs and villages round about. These were the centeniers, or hundred-men; there were also here and there traces, as in England, of a lower division into decuries or tythings; the counts had also their "viguers," their "viscounts," as they were afterwards called, who represented them, and they also appointed (if the work were not done by the Missi Dominici, the imperial commissioners) officers called scabini (échevins, or in German Schöffen), local judges who held lesser courts in country places. In addition to these courts each chief and each considerable churchman held his own pleas; by these the condition of the free Franks, of the slaves, and of such persons as were still just above the servile state, was decided, all questions between them and those above them adjudged, with no very happy results in the main.

The emperor, honestly desiring, so far as he could, to arrest the downward progress of the feeble free Franks and of the still more wretched slaves, sent forth the above named Missi Dominici to travel through the different districts of the empire, and to see with their own eyes the state of the people. Usually, they went out in pairs, a layman and an ecclesiastic, so that the secular and church courts and benefices should each be inspected by a man of the same order as the lord whom they visited. They traversed the districts assigned to them in circuit four times a year, held courts to which even the counts were bound to come, looked into the details of government, reformed gross abuses, reported to their master on all persons, even the highest, appointed when needed fresh scabini and others, removed unworthy persons, looked to the poor, protecting them as far as possible from want and want's kinsman the oppressor. The great evil of the time was injustice defended by bribery; the local judges could not resist the powerful or wealthy ill-doer, and so the wrongs of the poor remained unredressed. The Missi, with more or less success, endeavored to lessen these evils. We may believe that in the main the clergy worked willingly with them: they had closer relations with and warmer sympathies for the poor folk; they administered a more stable and intelligent code of laws; they were the depositories of learning, and desired to educate those around them; even in the worst times the humane morality of the Gospel gleams forth. In the days of Charles the Great all churchmen turned to the emperor and paid willing allegiance to him; the ancient political coolness between the Carolings and the episcopate entirely disappears.

The elements of society in Gaul at this time may be easily summed up. There were great Frankish lords, gradually diminishing in numbers as they grew in power and territorial independence; there were great bishops, chiefly in the cities, and lordly abbots in country places, who were all by degrees becoming assimilated in condition to the Frankish

814-840. nobles; there was also a rustic clergy, whose state was poor in the extreme; then there were the free Franks, scarcely above the level of slaves, and ever slipping down into the servile class; then Gallo-Romans in much the same condition; and lastly the slaves, who are said to have formed nine-tenths of the population. The picture is one of great wretchedness, oppression, injustice; the great Charles himself felt no sure ground under his feet in dealing with the social condition of his subjects. It is clear that society must pass through vast changes before anything like an orderly and flourishing community could exist, and that even the splendid climate and soil of Gaul would long do little to better the condition of its inhabitants. The wretched period which comes to Gaul after the death of Charles is the time in which, from the older relations of chief, free Frank, and slave of war, we pass gradually and almost insensibly to the later feudal relation of lord and vassal and serf. The coming time was, as has been said by Hallam, "the age of the bishops;" but in fact the bishops were only doing in their sphere what the lay chiefs were also achieving in theirs, —laying the foundations of a feudal independence which was for ever striving to lapse into feudal anarchy.

Louis the Pious.

On the death of Charles the Great, the eyes of all turned hopefully to his only surviving son the gentle Hlodowig, Louis the Pious. His father had summoned him to Aix-la-Chapelle, had made him emperor, and then had sent him again to Aquitaine till his time should come. In him all sweet qualities of piety, morality, culture, seemed to find their home. His Aquitanian rule had brought with it untold blessings to the south; he, too, had learnt their best lore, had become acquainted with their art, their poetry, above all with the Roman law; he was a man of thirty-five when he became emperor, vigorous, pure-souled, intelligent. Men thought that his father had done the rough-hewing of his great work, and that the new emperor would be the organizing Augustus following the creative Cæsar. His soul was full of high and conscientious aims; he would make reforms which should regenerate without weakening society; he would restore the clergy to high authority, would give full powers to the great lords, would save free Franks from slavery, and thus secure harmony and peace throughout his vast dominions. How different was the actual result! This noble prince, so dignified, earnest, right-minded, of "sound mind in sound body," gentle and simple, had all the dangerous virtues which grow to be calamities in rough times; his monkish tastes, his Christian forbearance, his want of an unscrupulous will, all pointed towards failure. Even within his house he was not master; and in the broad wild territories of the empire he was destined to a like failure. On the death of his first wife, Hermingond, who had borne him three sons, Hlothar, Pippin, and Hludwig, he married Judith, daughter of Welf the Bavarian, a dangerous and ambitious lady. Her son Charles, afterwards styled "the Bald," brought the emperor many troubles, for the natural jealousies sprang up between the children of the first bed and the second wife and her son. War soon followed, in which personal ambitions were seconded by the ancient enmity between German and Gallic Franks. Struggle followed struggle, partition led to partition; there is no drearier piece of history than Nithard's short chronicle of those years. The unlucky Hlodowig was buffeted about, now deposed, then restored again; now bowing his head before the clergy of Roman France at Compiègne, now recalled to rule, as it seemed, by the unanimous voice of his sons and his subjects. The main result was the separation, which then began, of France from Germany. In the midst of it Hlodowig the Pious died in 840, and was buried at Metz.

His death was the signal for the final disruption of the empire of Charles the Great. Hlothar, his eldest-born son, took the imperial name, and claimed supreme headship over the Franks. The Bavarian or German Hludwig, and Charles, who represented the Franks in France, both resisted; the Franks in Italy, Aquitaine, and Gothia, rallied to the emperor. War broke out at once. As soon as ever the Aquitanians had joined his forces Hlothar challenged his brothers to battle, and they at once accepted his wager.

On the banks of the Cure, near Troyes, was fought the great battle of Fontanet, which brought the griefs of the age to a point. There the whole Frankish race struggled for the mastery. From Italy, Austrasia, Aquitaine, Gothia, came the emperor's supporters; Germany, Neustria, Burgundy, supported Charles and Hludwig. The carnage was terrible; Fontanet is the burial ground of the old Frankish life; free Franks are heard of no more; "there remained in Gaul only lords and serfs; all things are made ready for the increasing of feudalism." Hlothar was entirely defeated and fled northwards to Aix-la-Chapelle; Charles and Bavarian Hludwig were masters of the field. When next year the two brothers found themselves once more menaced by the emperor, they met with all their forces at Strasburg, and took solemn oath each to other, Hludwig swearing in the "Roman" tongue, the earliest French in existence, and Charles the Bald in the "Teudisc" or German; and the armies standing round them repeated the words, the German Franks in German, the Gallic Franks in French. The text of the oaths is preserved for us in Nithard;[1] they are a striking evidence of the way in which Germany and France were asserting each its independent character. The "Romance tongue," the speech of the common people in France, their modification of the Latin they had learnt long before, henceforth took the place of the Latin language on the one side, and of the native Germanic speech of the Franks on the other; henceforth the name of Frenchman may come into use. 840-843.

As a result of this agreement between Charles and Hludwig, Hlothar was driven back to Aix-la-Chapelle. He thence fled to Lyons, to be near his southern friends; and, finally, finding himself completely overborne by their opposition, he made with them the famous Treaty of Verdun in 843, in which three kingdoms were distinctly marked off:—France for Charles the Bald; Germany for Ludwig the Bavarian; for the emperor Italy and a long narrow strip lying between Germany and France, a conventional district, which a little later received from its lord, the second Hlothar, the conventional name of Lotharingia or Lorraine. Charles the Bald had for his kingdom all Gaul west of the Scheldt, the Meuse, the Saone, and Rhone; it ran down to the Mediterranean, and was thence bounded by the Pyrenees and the Atlantic. It included therefore the chief part of modern France. It was Charles the Bald also who allowed the county of Paris to become a part of the duchy of France, so that the dukes of France were also counts of Paris; from this arrangement sprang eventually the decision of the momentous question as to what city should become the capital of modern France. In this manner the magnificent empire of Charles the Great came to an end, and in its place arose the nations of Europe. Speaking of the year 841, Nithard tells us that throughout the breadth of France the utmost confusion and rapine oppressed the people; in thirty years there had been five partitions of the Frankish empire, each marked with its own violence and misery; and the condition of the inhabitants, groaning under the ambitious foreign rule of quarrelsome princes, was as bad as well could be. The time, however, was now coming in which the greater lords of Neustria began to forget their German interests and nature, and to move towards a national French life. At first their action was chiefly disruptive, aiming at a local territorial independence; lay lords and great bishops alike pushed their pretensions to the farthest point; hostile to the imperial ideas of Germany, they had no sympathy with any national ideas for France. Nor is this strange, for France can hardly in any sense be said to have existed in their day. We have reached the time in which feudalism emerges from its earliest stages, and strives to lay the foundations of its independence. From the Treaty of Verdun in 843 to the accession of Hugh Capet in 987, France passes through a dreary and confused period of formation.

Charles the Bald.

Charles the Bald is a fit representative of such an age; he passed a long life sweeping together territories under his nominal sovereignty, and endeavoring to secure to himself the imperial dignity and the commanding position of his great namesake and grandfather; and though he was at the outset king of Neustria, his interests lay far more outside than inside France; the instincts and sympathies of Charles, as of all his family, were German. His schemes and struggles, rewarded in the end with apparent success,—for just before his death he was crowned king of Italy and emperor,—in reality were fatal to the Caroling dynasty. He bought his advancement first by subservience to the greater clergy, and afterwards by granting to the feudal lords the charter of their independence. After the Treaty of Verdun had apparently given to

[1] Nithard, *Hist.*, iii. (ed. Pertz, pp. 38, 39).

843-875. Charles the Bald undisputed lordship over the western portion of the empire, three states still resisted his authority:—Brittany, which, under Nomenoe, asserted and secured her independence; Septimania, which drove out his armies for a while; and Aquitaine, in which the vices of Pippin gave Charles a footing, and made a way to his success. For several years his whole energies were engaged in these bootless struggles, while at the same time his coasts were being ravaged by the Northmen. He was obliged to pay a heavy sect before he could deliver at one time the rich valley of the Somme, at another the walls of Paris herself, from their devastations. In a capitulary of 877, the last year of his reign, we have the levy of a contribution in order to buy them off from the Seine. In 855 the death of the emperor Hlothar was the signal for a fresh division of lands, in which Charles got his share in Lorraine and the kingdom of Provence. His fortunes, however, scarcely mended; overshadowed by nobles and bishops, his tenure of his kingly throne was ever precarious. The great lords, seeing in him a tendency towards resistance of their claims, called in German aid to dispossess him; and Ludwig the German came to their help. The inhabitants of Gaul, roused by the appearance on their soil of these German antagonists, rose and drove them back to the Rhine. Charles seized the opportunity of strengthening himself, as he hoped, by appealing to the church; the church by its spokesman, the great Hincmar of Rheims, replied by accepting the call, by declaring her authority over kings, and by tracing the lines of episcopal and royal power:—"If kings rule after God's will, they are subject to none; if they be great sinners, then is their judgment in the hands of the bishops." Hincmar, in these words, stretched wide the rule by which the clergy had claimed to exercise judicial functions in the case of ordinary malefactors. And thus the clergy rewarded themselves for having saved Charles from the hands of the nobles and the Germans. The reins of power were now entirely left in Hincmar's hands, and the dreary capitularies of the reign bear evidence in every page of the overwhelming influence of the clergy. Not satisfied with his supremacy in church and state, the great archbishop pressed forward into philosophical and theological controversy, and took his share in those discussions which heralded the incoming of scholasticism. He opposed the views and influence of John Scotus Erigena, the head of the palace school of Charles, and may be perhaps said to have given that direction to thought and speculation which marks in the main the course of the whole philosophy of the schools.

Towards the end of his reign there was only one prince, Ludwig the German, who shared with him the vast empire of Charles the Great. And in 875 on the death of Ludwig II., emperor and king of Italy, a handful of bishops and counts assembled at Pavia offered the imperial crown to both these princes. Charles arriving first was forthwith proclaimed "protector, lord, and king of Italy" by the pope. In the next year Ludwig the German also died, and Charles, not content with the imperial dignity, which he already possessed, nor with the ample extent of the territories nominally subject to him, desired to restore the old imperial unity, and to obtain the crown of Germany in addition to those of the west and south. The sons of Ludwig naturally resisted; and then, in order to secure the hearty aid of his followers, he held the diet of Quiersy-sur-Oise (Carisiacum) in which was drawn up the great capitulary sometimes styled the Magna Charta of French feudalism. Beneath a cumbrous covering of words, and connecting the hereditary succession of his own son with his large concessions to his nobles, Charles in fact conceded hereditary rights to all freeholders. Any lord who should desire to renounce the world might leave his benefices and honors to his son, or otherwise as might seem good to him; and any lord whose hold on his worldly goods was brought to an end by death might leave his dignity to his son (Baluze, *Capitularies*, ii. p. 259), and thus in definite terms the hereditary usage of centuries became hereditary right. Hitherto, in France at least, a fiefholder held at his lord's pleasure, and was, in theory, liable to deprivation at any time; henceforth, he was as secure in law as in fact, and could transmit his lands and dignities to his son without risk of loss. The title of duke or count is henceforth attached to one family; as the royal and the imperial power become weaker, the great families grow in strength; until a century of *fainéant* Carolings comes at last to an end, and their 875-893. place is taken by the representative of one of the great houses, the duke of France and count of Paris. Then the new kingdom of France with its new capital will begin with Hugh Capet in 975. For the family of the counts of Paris had come to occupy the ground abandoned by the Carolings; they were the champions of the Gallic people against the Northmen. Only twenty-seven years after the death of Charles the Great, in 841, Rouen had fallen into Norman hands, opening the way for them up the rich Seine valley as far as to Paris. From that moment the city had no peace; and in 861 Charles the Bald invested a brave adventurer, Robert the Strong, with the county of Paris, and set him to resist the invaders. Bravely he struggled against them, and in the end gave up his life in defence of his people. In so doing he laid the foundations of the first French monarchy; his two sons were, to all practical intents, local kings of France; his great-grandson was Hugh Capet. Very different was the career of Charles the Bald. His famous order to his assembled lords, "Let each man defend himself in his fortress," with which high sanction for castle building and local independence he dismissed his feudal levies to shift for themselves, showed that the centre of power was completely gone. The king abandoned his people to any one who would defend them; their defenders rose to greatness, and the Caroling house sank into supine nothingness. Yet he still struggled, though in vain, against the sons of Ludwig the German; after an unsuccessful campaign in North Italy, death overtook him as he was recrossing the Mont Cenis pass (877). Louis his son succeeded him, the Louis II. of French historians, the "Stammerer." He had been for ten years king of Aquitaine, and, when he succeeded to his father's throne, found himself little but the slave and puppet of the great nobles. He soon died (879), leaving a kingship weakened and divided. His two sons, Louis III. in the north and Carloman in the south, were set on their thrones by the nobles, headed by Count Hugh, "first of abbots." These also soon died,—Louis in 882, Carloman in 884; and the representatives of the Caroling family were reduced to two princes of the name of Charles,—Charles the Fat, the emperor, son of Ludwig the German, and Charles "the Simple," "the Fool," a child of five years, youngest son of the stammering king. To the emperor fell the nominal sovereignty over the chief part of the Caroling territories. He, however, was incapable, lazy, a most degenerate shoot of the great house of Pippin. In France he did almost nothing; the Northmen scourged the land incessantly, and in 885–886 laid terrible siege to Paris. The citizens, led by their bishop Gozlin, by Hugh, "first of abbots" (for he was abbot of St. Martin at Tours as well as of St. Denis), and by Odo (or Eudes), count of Paris, made heroic and dauntless resistance. In vain did Hrolf the Northman press the town with active siege or dull blockade; the death of Gozlin and Hugh could not shake the fortitude of the defenders; Count Eudes repulsed attack after attack, and held his own. At last Charles the Fat appeared on Montmartre with a great host of Germans; and the Parisians hoped to see vengeance taken on their pagan foes. Charles the Fat, however, had none of their heroism; he contented himself with buying the Northmen off. As they retired, the citizens rushed out and inflicted one great blow on them, and the great siege was over. Charles withdrew into Germany, and in 887 was deposed and abandoned by all. He died the next year at Reichenau.

The Capetian line begins.

On his death in 888 the nobles of France, irritated against their half-foreign Caroling lords, chose Eudes, the stout defender of Paris, the elder son of Robert the Strong, as their king; he ruled over the land between the Meuse and the Loire, and was the forerunner of the Capetian line of princes, the first person who may be spoken of as a French king. The Carolings still spoke German, and had small love for France; the family of Robert the Strong was patriotic and vigorous, and had shown in the great siege that it might be trusted for defence. In the election of Eudes we see the victory of the feudal lords over the imperial or royal power, we feel that the Frankish name and influence are dying out, and that another set of lords and defenders is rising up to cope with the Northmen and to reduce the land into something like order. Eudes ruled from 888 to 893, striving manfully against the Northmen, whom he so far quelled

893-987. as to induce them to cease from their devastations of France, and to turn their arms against the English shores. He tried in vain to conquer the southern part of France, and after a long struggle was fain to leave them in their independence. Then the southern lords held a great assembly with the Caroling party of the north at Rheims in 893, and elected Charles the Simple their king. He placed himself under the protection of Arnulf, king of Germany, who formally invested him with the kingdom of France, and sent soldiers to assert his claims. This was quite natural; for in the eyes of the Carolings the head of the German branch was the head of the whole family; all other members of it were his vassals, them he protected, to him they swore allegiance. After a struggle of some years Eudes died, and Charles then became sole king of France. Robert, brother of Eudes, received the great title of duke of France; and these two personages headed the two parties, the Germanic Carolings and the French-speaking nobles.

Charles the Simple. Charles the Simple reigned undisturbed for many years: perhaps he was not altogether so foolish as his name declares him. In his day the Northmen, hitherto mere depredators, became permanent settlers in France. Everything there was so weak and defenceless that the invaders had only to choose; the miserable people, the old Celtic inhabitants of Gaul, welcomed their settling; it was a relief from the infinite woes under which the land was suffering. One band of Northmen established themselves on the Loire; another, under Hrolf, the fierce leader of the attack on Paris, settled at Rouen (911) and subdued all the country round, on both sides of the Seine. An orderly and strong government once more grew up in France, and Charles the Simple, advised by the churchmen, made terms with Hrolf, giving him his daughter Gisela to wife, and on due feudal tenure granting him the lands he had won by the sword (912). The stout pagan was baptized by the name of Robert; his followers, after their fashion, loyally did as he had done, and the history of Normandy began: Hrolf becomes Duke Robert, his people become Frenchmen. The duchy soon grew into a compact and orderly state, prosperous and vigorous; Norman towns and churches sprang up on all hands, French manners and speech soon ruled supreme, and in all the arts of peace, in building, commerce, letters, the Normans forthwith took the lead. The noble Scandinavian race, destined to influence so large a portion of the world's history, herein made worthy mark on the soil and the institutions of France.

Soon after this time the French lords, headed by Robert, duke of France, the "king of the barons," second son of Robert the Strong, rose against their Caroling king, and shut him up in Laon, the last stronghold of his family; thence he fled into Lorraine. On the death of Robert, the barons made Rodolf of Burgundy their king, and continued the strife; and Charles, falling into the hands of Hubert of Vermandois, was held by him as a hostage till his death in 929. Rodolf then became undisturbed king till he too died in 936. The barons under the guidance of Hugh "the White" or "the Great," son of Robert, the greatest man of his age, sent over to England for Louis, son of Charles, who had been carried thither by his mother for safety. This is that "Louis d'Outremer," "Louis from Over-sea," who now became king; after showing unusual vigor in a struggle with Otho the Great of Germany, who claimed the kingship over France, he was recognized by all in 941. His reign could be nothing but the miserable record of a struggle against the great lords, Hugh the Great and Richard of Normandy. In this perpetual and wearisome strife he spent his latter days, and died, still a young man, in 954. He was the only man of energy among all the later Carolings. His son Lothair succeeded; his was a long and inglorious reign, ending in 986. His son Louis followed, ruling for a single year. He died childless in 987; and the only heir to the throne—if the feudal lords chose to recognize an hereditary claim—was his uncle Charles, duke of Lorraine. The barons did not choose to be so tied; they set the Caroling prince aside, and elected Hugh, duke of France, to be king. He was afterwards solemnly crowned at Rheims by Archbishop Adalberon.

Thus did Hugh Capet, founder of a great dynasty, come to the throne. With him begins the true history of the kingdom of France; we have reached the epoch of the feudal monarchy.

II. The Feudal Monarchy.

987-996. Hugh Capet, eldest son of Hugh the Great, duke of France, was but a Neustrian noble when he was elected king. The house of the Carolings was entirely set aside, its claims and rights denied, by the new force now growing up, the force of feudalism. The head of the barons should be one of themselves; he should stand clear of the imperial ideas and ambitions which had ruled the conduct of his predecessors; he should be a Frenchman in speech and birth and thought, and not a German; but, above all, he must be strong enough to hold his own. And among the great lords of northern France, the representative of the house of Robert the Strong held the most central position, and united in himself most elements of strength. His lands lay between the Burgundians and the Normans, and stretched, north and south, from Flanders to Aquitaine. Not so long ago the duke of France had been the champion of the whole land against the invasions of the Northmen, and the successful defence of Paris had assured to the duke that position of protector of French interests which passed naturally into a kingship. The connections of the house were also a great source of strength; the duke was abbot of St. Martin near Tours, the spiritual lord of the Loire, and abbot of St. Denis near Paris, the spiritual lord of the Seine. And not only in connection with the church was he strong; his alliances with the lay-lords were equally fortunate. The lesser barons looked up to him; he was brother to Eudes Henry, duke of Burgundy, on the one side, and Richard the Fearless, duke of Normandy, on the other side, was his brother-in-law. Lastly, his was a compact and central territory: he was feudal lord of all Picardy, and held a large part of Champagne; Paris, Orleans, Chartres, the counties of Blois, Perche, Tours, Maine, were also his. The domains of the dukes of France formed a long and rather narrow strip; the western border running nearly north and south, touched the sea just above the mouth of the Somme, and reached the Loire a little below Orleans. Paris was as nearly as might be the centre of this district, which was bounded to the north by Flanders and Hainault, to the east by Champagne and a corner of Burgundy, to the south by Aquitaine, to the west by Normandy. The lords of these districts regarded themselves as at least the equals of the new king; the chief of them were the dukes of Normandy, Brittany, Burgundy, and Aquitaine, and the counts of Flanders, Champagne, and Vermandois.

Hugh Capet, first true king of France.

The accession of Hugh to the throne was not undisputed. Charles of Lorraine, rightful heir to the Caroling throne, resisted him for a time, and was upheld by a formidable party among the nobles and churchmen. Their headquarters were at Laon, on the northern frontier of Hugh's domain; their strongest friend was William Fier-à-bras, duke of Aquitaine, on its southern limit. The hearty support of the Normans alone secured the new king's throne. After a short, sharp struggle, in which clerical treachery was as prominent as knightly valor, Hugh got his rival into his hands, and imprisoned him at Orleans, where he died. In a short time all the princes north of the Loire had recognized his authority. The clergy of his domains and territories looked up to him as their friend and champion, and willingly, as an end of strife, deposed Archbishop Arnulf of Rheims, who was nephew of the fallen Caroling prince, and elected in his room the famous Gerbert (afterwards pope as Sylvester II.), the most learned man of his age, who had dared to visit Saracenic Spain, and to bring thence to the north some of that science which gave him the fascinating reputation of being a sorcerer. He had been also in Italy, welcomed and rewarded by Otho the Great; he had taken the lead in the election of Hugh Capet. His elevation to the archbishopric of Rheims placed Hugh in direct antagonism to the papacy, and added much to the troubles of the king's life. And in truth his reign was a constant struggle; he won his kingly name with a life-time of anxious work, and with loss of much of his own domain, which he had to grant out as rewards to the faithfulness of his followers. At the time of his death in 996 it looked as if he was a weaker man than he had been nine years before. The Norman and Aquitanian dukes were stronger than he was, stronger than they themselves had been nine years before; in Burgundy his brother's power was little more than a nominal lordship; the eastern frontier of France seemed to be split up into a chain of independent principalities.

996-1041. Hereditary principle in France.

On the Christmas day after his election in 987, Hugh Capet had called together his friends at Orleans, and had persuaded them to elect his eldest son Robert as a joint-king. Himself king by the will of his peers, he clearly desired to give the new kingship the hereditary impress, and to secure it to his family; and it may be noticed that in no country has the strict law of hereditary succession been so potent as in France, overbearing, as it did in the extreme case of Henry IV., even the opposition which that prince aroused, and securing an unbroken male descent down to the Revolution.

Robert.

Robert succeeded as sole king in 996,—not a good exchange for the infant kingship. For if the vigorous Hugh was embarrassed by both friends and foes, Robert, with far more piety and far less force of character, seemed certain to be overwhelmed. For Robert "the Pious" or "the Debonair," was an easy kindly man, the delight of monkish chroniclers, endowed with all the charming and dangerous virtues which commend themselves in the man, and often prove fatal to the king. His was a long inglorious reign of twenty-five years,—a constant struggle, first with the church for his wife, afterwards with his barons for his existence.

His first wife had been his distant cousin. The papacy, which could do nothing against his father, forced him to put her away; and though he did so very reluctantly, he speedily took another wife, Constance of Aquitaine, politically an important alliance, though she led him but a wretched life. The followers who came with her from the south introduced new tastes and ideas into the ruder north, and were regarded with detestation by the clergy as effeminate and vicious foreigners. We note a national feeling springing up,—for nationality is nowhere so marked as in its hatreds; to the barons and clergy of the Seine the people of the Garonne were aliens. The opposition also which existed between feudal nobles and churchmen, and the oppressed people struggling for some liberty of action and belief, expressed itself in the futile rising of the peasantry in Normandy (997), and in the slaughter of the Manichæan heretics of Orleans. The whole country was also vexed with civil strife; the king had to contend with his masterful queen, backed by her rebellious sons Henry, heir to the throne, and Robert, duke of Burgundy; in Normandy Richard the Fearless died in 1027, leaving war between his sons; the successful brother Robert secured the dukedom, and, thanks to dark suspicions as to his methods, went by the title of "the Devil."

Henry I.

Robert I. died in 1031, to the great grief of his poor people, to whom, after his way, he had tried to be as a father. His son Henry, whom he had crowned as joint-king in 1017, succeeding to the throne, had to face the bitter hostility of his mother, and of the duke of Burgundy. The duke of Normandy, following the policy of his house, sided with the king, and, crushing the revolted barons on his flank and that of France, made his already terrible name a curse to central France. A peace was patched up by Fulk Nerra, count of Anjou; Robert was confined in his duchy of Burgundy, and ere long Constance, by dying, smoothed the way to tranquillity; the weak king gave in before the strong nature of Robert le Diable, and Normandy became the most powerful state in France. The condition of the whole country, scourged with incessant private war, and lacking all central authority, became so bad that the church at last intervened; in 1036 the "Peace of God" was proclaimed, and accepted in southern and eastern France; the bishops of Burgundy also did their best for peace, and at last the bishops of the north also followed their example. In 1041 was proclaimed the famous "Treuga Dei," the Truce of God, in which all fighting was forbidden from Thursday evening to Monday morning, on all feast days, in Advent and in Lent; religion thus endeavored to extend her protection over almost all the year, and greatly mitigated, if it did not abolish, the evils of private warfare. Many were the signs that some great change was coming. The terrors and hopes roused at the millennial year; those feelings renewed and strengthened, only to be disappointed, at the date of the thousandth year from the crucifixion of our Lord; the fearful contrast between the famine and misery desolating France and the brilliant dreams of the coming kingdom of the just; the slow but real entry of Oriental learning into the west of Europe; the steady set of a stream of pilgrims toward the Holy Land, pre-eminent among whom was Robert of Normandy; the renewal of Norman adventure and conquest, specially in southern Italy; the establishment of the ascendency of monasticism with its champion Hildebrand at Rome, and its renewed vigor in both France and Germany,—all these things mark the reign of Henry I. as a time of preparation for the world's struggle that was coming, for the terrible strife of Christian and Saracen over the holy places of Palestine. The conquest of Sicily and southern Italy, as well as that of England a few years later, made the Normans the foremost champions of the papacy, and the leading power in Europe. 1059-1096

During these years the kingship of France was in very unworthy hands: Robert, weak and pious, had done nothing to strengthen his throne; his son Henry, immersed in petty warfare, fared no better, and feeling his end to be drawing near, in 1059 had his son Philip crowned as joint-king with himself. He died in 1060, leaving his throne to a prince weaker even than himself. The contrast between these petty kings of France and the grim dukes of Normandy must strike every one: Richard the Fearless, Robert the Devil, William the Conqueror, colossal figures, strong and fierce, take all the sunlight from gentle Robert, weak Henry, dissolute Philip, kings of France. Philip I. And, in fact, a history of France which should take account only of her kings and their reigns would be completely delusive; the royal power is felt in this 11th century over a very small part of the surface of the country; the great lords are stronger by far than the king in their midst. Normandy rises to very great eminence; Aquitaine is fairly consolidated into a strong southern power; though towards the east the more Germanic princes split the land into petty lordships, the two Lorraines are sometimes under one duke; on the other side Brittany was entirely independent. Across the whole northern frontier the German influence was supreme. Philip was little able to cope with these antagonists. He made an attempt, which failed, to secure Flanders; he withstood William the Bastard in 1076, and made peace with him; and when, after the Conqueror's death, Norman and English interests were somewhat parted, the dangers of a Norman ascendency over France diminished. Somewhat later (1094) Philip was involved in a contest with Rome, the church being now the champion of Fulk of Anjou, whom the king had wronged by carrying off his wife,—a struggle as honorable for the papacy as it was discreditable to Philip. The church, however, was not now led by the mighty hand of Hildebrand. Gregory VII. had died in 1085, and in the reaction which followed it looked as if the papacy itself might fall. Germany, ever protesting, opposed its claims, often with an anti-pope of her own; the French king, a weak man, with a wretched cause, was yet able to defy the pontiff; William the Bastard, even in Hildebrand's days, had refused to acknowledge his claims; the Normans in Italy were at best but turbulent friends; the Saracen was still a threatening neighbor. In these dark, cloudy times the papacy, by a wise instinct, took for its motto the ancient "ex Oriente lux," and placed itself in the van of that general movement which led to the crusades. The pope who took the great step was Urban II., a Frenchman by birth; it seemed to him that if he could stir the warm blood of turbulent French nobles, and the sterner valor of the Norman character he might head a holy enterprise, and so doing deliver the papacy from all its difficulties, and perhaps assert its lordship over the world. The crusades.

Urban crossed the Alps in 1095, and came to Clermont in Auvergne. There he was in a central position, within reach of both southern and northern France, and yet not within the domain of the excommunicated Philip, sitting sulkily at Paris. The pope's famous sermon at the council, though at the moment it seemed to fall flat on princely ears, set the crusades in motion, and was the prelude to great events, great changes in Asia and Europe. France took the foremost part in the movement; she seemed to lead the half-formed nations of Europe in the common enterprise; her great men are the heroes of the epoch; "the crusades," says Michelet, "had their ideal in two Frenchmen; they are begun by Godfrey of Bouillon [who, however, was not strictly a Frenchman], and Saint Louis closes them." The latent uneasiness and misery of the people needed only the call; a countless multitude of the common folk flocked to the banner of Peter the Hermit. The excitement went on increasing throughout the year 1096, and as it slowly

1096-1100. gathered force and form, bystanders must have looked with amazement at the strange materials out of which so great a movement grew. The first crusade was altogether popular in character; there was in it little of knowledge or discipline; it was rather like those instinctive emigrations which, flowing from the north or east from time to time, have overwhelmed the more civilized portions of the world. In the pope's sermon at Clermont there was a striking passage which contrasted the wretchedness of men's daily life in France with the comfort of the "land flowing with milk and honey" towards which he directed their eyes. Religious enthusiasm joined with present misery; the dream of a millennial home in Palestine instead of famine and pestilence in France—here is the force which set the first army moving towards the East. And, naturally enough, that first army was almost entirely composed of the common people; the feudal lord felt none of the stings of want, and as yet had no interest in Eastern adventure.

The first crusade.

The vast throng of crusaders who set off eastwards in the summer of 1096 was divided into three hosts. The van was led by the one soldier of the company, Walter the Pennyless,—he had at his back about fifteen thousand footmen; the main body of French pilgrims, led by Peter the Hermit, followed next; then came a rabble of German peasants, under the guidance of Godescalc, a monk; on the skirts of the whole force hung an independent body of horsemen. A small band of Norman knights alone saved this crusade from absolute contempt. With great loss the host traversed Europe and were put across the Bosphorus by the emperor Alexius. There they met the Turk at last, and found him more than their match. The energy of Kilidg Arslan, the sultan of Nicæa, soon destroyed them all; they perished far from the walls of Jerusalem.

Meanwhile the interest in the holy places was far from growing less in France. It at last attracted the attention of the lord as well as of the vassal, and the second expedition promised to be very different from the first. Like the first, it was also divided into three hosts,—a northern, a central, and a southern. The northern army was composed of Flemings and Lorrainers, under command of Godfrey of Bouillon, duke of Lower Lorraine, a Caroling prince; it had little or no French blood in it. The central army was French, Norman, and Burgundian, headed by Hugh, count of Vermandois, King Philip's brother, who commanded the Frenchmen; by Robert, duke of Normandy, leading Englishmen and Normans; by Alan of Brittany, with his Celtic following; and by Stephen of Blois, head of that powerful house, who had espoused Adela, the daughter of William the Bastard, and was father of Stephen afterwards king of England. The third army, by far the most complete and best equipped, was composed of the southerners subject to Raymond of Toulouse. The Italian Normans, under Tancred and Bohemond, set forth by themselves. These all, by sea or land, converged on Constantinople, and great was the anxiety of Alexius, who had but one wish, that he might see them safely across the narrow strait which severs Europe from Asia. At last they were all passed over; and William of Tyre declares that at a great muster held on the Asiatic shore there stood forth seven hundred thousand men in all. The figures may be extravagant; there is no doubt that the host was vast and strong. And so Kilidg Arslan found it. He attacked them again and again as they moved southwards through Asia Minor; but they defeated and crippled him so that he could not stay their advance. They reached Antioch, and took it after a long siege and fierce fighting, which broke the power of the Seljukian Turks. They left Bohemond the Norman as prince of Antioch, and marched onwards. Baldwin, Godfrey's brother, moving eastward to succor the Christian lord of Edessa, took the place for himself, and founded the Frankish county of Edessa in 1097. The main body, reduced by many causes to about forty thousand warriors, reached Jerusalem, and after a desperate siege, signalized by prodigies of valor, stormed the holy city on the 15th of July, 1099. The crusaders at once elected Godfrey of Bouillon king of Jerusalem; and though he did not accept so sacred a title, he became lord of the holy city, and the Latin kingdom of Jerusalem began. So long as he lived, he ruled with vigor and success; and the year 1100 seemed to have almost fulfilled the millennial hopes which had been so bright a century before. The battle of Antioch in 1098 had broken the Seljukian power; that of Ascalon in 1099 checked the Fatimites; and Godfrey seemed likely to found a permanent Christian lordship in the East. But death soon closed his career, and the organization of the great conquest was left to others. Four Latin principalities, Jerusalem, Tripolis, Antioch, and Edessa, were formed, and arranged on the strictest principles of conscious feudalism: the new kingdom of Jerusalem held only of the papacy. 1100.

At home the French monarchy was far from quiet, indolent Philip being threatened by the vigorous attack of William II. of England, who claimed once more the French Vexin, and also made war on the count of Maine. In this obscure warfare Philip's eldest son Louis, to whom was entrusted the defence of the western frontier, showed ample promise of his vigor, though it was the arrow in the New Forest which in 1100 relieved the French king of all fear of his rival. Henry Beauclerc, the Conqueror's youngest son, succeeded William in England, and before long (1106) had conquered and captured at Tinchebray his elder brother Robert Courthose, the crusading duke of Normandy. Under his capable government England and Normandy enjoyed repose and prosperity.

When it was known in the West that Godfrey of Bouillon was dead, and that the infant kingdom of Jerusalem was in danger, William IX. of Aquitaine, who, now that Raymond of Toulouse had settled at Tripolis, had become the foremost prince of southern France, set forth with new levies to the succor of the cause. He was joined by some few northern barons, one of whom, Herpin of Bourges, sold his lordship to Philip of France, and began that transfer of feudal territory which was of the highest service to the kingly power. With Bourges the French monarchy for the first time got footing on the south bank of the Loire. The expedition failed ignominiously; William came home to Aquitaine almost alone; and an attempt made somewhat later by Bohemond of Antioch on Constantinople itself came also to nothing. With these two failures the first crusade ended. As yet its effects on France could hardly be felt; the papacy alone was at first seen to be a gainer by the movement. For the new and rigid feudalism of Jerusalem, with its hierarchy of lords, and its code of justice, the famous Assises, all eventually looked to the papacy as its head. While the Western monarchs all strove against the pope, the pope was the sole support and undisputed master of the monarchy of the East. In one respect this first crusade is specially interesting to France; her language, newly assured of independent life, no longer a patois or a dialect of the common Latin, received fresh recognition, and spread abroad in the world. As Latin was the common speech of the church, so French became the common speech of warlike Christendom. It had been carried by the Normans into England and Sicily; now it was the recognized tongue of the Latinized East; and from this time onward it was adopted as the language of feudal and political life.

Louis VI.

In the year 1100 Philip, following the traditional usage of his house, had made his son Louis joint-king, and put off the burdens of his royalty. The young man, full of vigor and a true king, had a hard struggle at the first; the limits of the royal power were very narrow; Louis is said to have built the greater Châtelet at Paris as a defence against the neighboring lord of Montmorency, who disputed with him the mastership over the plain of St. Denis; on the other side, he had much ado to come by the castle of Montlehéri, which barred his way southwards to Orleans; his mastery over his own barons was very slight; his suzerainty in districts farther off, over Champagne and Burgundy, over Normandy and elsewhere, was scarcely more than nominal. But Louis had force of character; his nicknames testify thereto, for was he not styled "the Eveillé, the Widcawake," and "the Batailleur, the Bruiser"? He knew how to rouse enthusiasm among his followers; no prince ever had a more loyal household or a stronger; the crusades relieved him of some of his most turbulent neighbors; the upspringing of the communes, with their civic liberties, afforded a counterpoise to the feudal violence of the baron's castle; above all, the royal domains under him were well administered. First of Capetian kings, he was felt to be the fount of justice, and it was seen that, as his wise biographer Suger says, "he studied the peace and comfort of ploughmen, laborers, and poor folk, a thing long unwonted," and all the more grateful for its novelty. The most marked of these charac-

1100-1131. teristics of King Louis VI.'s reign was the growth of town liberties, which began just before and after the year 1100. France has always been remarkable for the large number of her small towns and her deficiency in large ones; the time we have reached gives us the beginning of this phenomenon. The little towns all through central France now became the refuge of the population against feudal lawlessness and oppression; and in the very centre, in the district round Paris, they took up the defence of the royal power against its most dangerous feudal neighbor, the duke of Normandy. "At this period," says Ordericus Vitalis, "popular communities were established by the bishops, in such sort that parish priests accompanied the king to siege or battle, bearing the parish flag, and followed by all the youth of the township." This movement showed itself most clearly in the towns just to the north of Paris. Laon, Noyon, Beauvais, the three seats of the clerical party, Saint Quentin, and a few others, all at this time bargained for and bought their liberties. The king placed himself at their head. As each parish priest, representing some little town, marched with the banner of that saint to whom his church was dedicated, so did King Louis go forth with the flag of his own church, the oriflamme of St. Denis. He is the first king of France who bore it officially; by it he declared himself champion of the Church of France, and of the new burgher-life which was springing up around him. The peasant also was glad to be on the same side. In the king's struggle against feudal independence we see continually how well he was seconded by the aggrieved rustics as well as by the civic levies, or by the "damsels," the young gentlemen who formed his warlike court. It would be misleading to say that this new burgher-life was the king's doing; he seems to have felt but little interest in it, great as was its influence on the future. He granted and withdrew charters according as it suited him, or as men offered him more or less. Even to the larger towns, the chief cities of the royal domain, Paris, Orleans, Melun, Étampes, and Compiègne, he only granted privileges, not any real constitutional rights. It is one of the misfortunes of French history that constitutional liberties never seem possible,—that even in the outset they are blighted, and in the end they perish.

By degrees Louis VI. secured his frontiers to the east, the north, and the south; with the west, where lay the fiercer Norman, it was a harder task. In 1119 he lost the battle of Brenneville, and had to abandon the cause of William Clito, son of Robert duke of Normandy, who claimed the duchy against Henry I. of England. In 1124 he was once more in collision with his Norman neighbor; for Henry Beauclerc had allied himself with his son-in-law Henry V. of Germany, who promised to attack the French king from the east, while Henry I. should assault him in the west. Louis VI. raised all central France to the rescue; it was seen how powerful he had become. His own men came in at once, and formed the nucleus of his army; his body-guard and the men of Paris, Orleans, and Étampes were in the centre round the sacred oriflamme, which Louis now brought forth for the first time. Champagne and Burgundy were there; Vermandois also with horse and foot; Pontoise, Amiens, and Beauvais sent the men of their communes. The greater lords farther off, though they held back, did not contest the king's right to call them out. The emperor, struck by this show of energy, or aware of troubles behind his back in Germany, abandoned all his plans of revenge against Rheims, where the council of French clergy had excommunicated him. The king soon made peace with Henry of England, and the storm passed over.

The fortunate issue of this war, and the king's interposition in the affairs of his neighbors, the submission of William of Aquitaine to his judgment, his attempt to find a lordship in Flanders for his friend William Clito, marked Louis VI. out as a powerful king, who had in fact triumphed over opposition at home and abroad. He followed precedent, and had Philip his eldest son crowned in 1129; he, however, was killed by accident in 1131, and the king then took his younger son Louis, "Louis the Young," as men called him, and crowned him as joint-king. The troubles of England, connected with the reign of Stephen, relieved him of anxiety for the rest of his days on his western borders; and the offer of William of Aquitaine to wed his daughter Eleanor to the young joint-king seemed to promise the happiest future for France. Louis VI. just lived to arrange the marriage, and then, on his way to St. Denis, where he yearned to end his days, for it was the school of his youth and the home of Abbot Suger his dearest friend, he was taken ill at Paris, and there died in the year 1137. 1137-1147.

This was the first real king of France, a man of noble nature and true kingly gifts. His greatest cross was his unwieldy bulk, though it could not hinder his activity; he was of humble heart and kindly, cheerful in health or sickness, a true father to his people. Had his successor been a man like himself, the task of welding France into one kingdom might have been achieved centuries ere it was at last brought to pass.

Louis VII. But Louis VII., the Young, and his queen Eleanor of Aquitaine, left by her father's death at this same time heiress of his great possessions in the south, were far below the level of the fat king, and retarded instead of forwarding the growth of the French monarchy. The advance of the country in mental and material prosperity during the late reign had been immense. Thanks to the crusades, and to the tranquillity which prevailed at home, town-life flourished, religion woke to new life, church-building took a fresh departure, philosophy began to feel her strength. If these are the days of St. Bernard, last of fathers, they were also the days of Abélard, one of the first of intellectual inquirers. To him is due the mental reputation of Paris, which in its turn led on at the end of the century to the establishment of the university of Paris, mother of all the learned corporations of modern Europe.

Louis VII. was no sooner sole king than he began to show how far he was below his great father; he was weak, timid before the church, vexed with a scrupulous conscience, the delight of monkish chroniclers, the contempt of men. From the beginning his ventures failed. He tried to coerce the great count of Toulouse into submission, and was ignominiously repulsed; he carried on a quarrel with the papacy over the cathedral at Bourges; declared, with Suger's support, that he had the right to nominate to that archbishopric; found Theobald count of Champagne for his own purposes opposed to him; attacked him impetuously, and burnt down Vitry church, in which a crowd of poor folk had taken refuge. The village bears in consequence to this day the name of Vitry le Brûlé, the Burnt. Then, stung with remorse, he gave way before the pope, who enjoined on him a crusade as a penance. In vain did the prudent and patriotic Suger oppose the royal impulse. Weak and excitable, the young king could not be held; the passionate appeals of St. Bernard were far more to his taste. It is interesting to note these two great and rival churchmen pitted against one another: St. Bernard champion of the universal lordship of the papacy, Suger endeavoring to defend the independence of the French monarchy. St. Bernard was the life of the movement; he was, however, too prudent to undertake the leading of it; he would provide the impulse, others must shape it to its end. In this crusade (1147) Germany preceded France, and the expeditions were headed by Conrad the emperor, and by the French king, who entrusted the charge of his country to his old preceptor Suger, although he would not follow his advice. This great churchman, a little man, weakly and thin, was of obscure and ignoble origin; he was educated at St. Denis, side by side with the good king Louis VI., and afterwards appointed abbot of that famous church. While St. Bernard represented patristic learning, and Abélard Greek philosophy, Suger was noted as a diligent student of holy scripture. He was the trusted adviser of both Louis VI. and Louis VII., and by his conduct as regent justified their confidence, and earned the name of Pater Patriæ. He has left in his writings more than one proof of his interest in the well-being of the French people, and of their wretchedness under their feudal masters,—one village "under the lord's castle trodden down and as miserable as if it were under Saracen oppression;" another, "subject to three talliages,—almost entirely destitute through the rapacity of its masters;" another, "so ravaged by the lord that it became utterly unfruitful and useless;" or again, in a fourth place, "the poor folk could scarce exist under the burden of so wicked an oppression." Under Suger's eye prosperity in part came back; but he could not hinder the failure of the crusading king, whose career in the East was a discredit and calamity. It alienated Queen Eleanor, lost him south-

The abbot Suger.

1149-1180. ern France, made him the contempt of his subjects. In 1149 he returned home with the merest fragment of an army, and Suger humbly withdrew from public life to St. Denis, spending the remnant of his days in good works and wise reforms within that narrower sphere.

At once Queen Eleanor sent to the pope for a divorce, and Louis VII. made but a half-hearted opposition, for she was in truth far too proud and vehement for him. The pope granted her wish in 1152, and immediately after Henry of Anjou wooed and won her, becoming thereby the strongest prince in France. The king tried in vain to make a league against him. Henry compelled all his foes to make peace with him, and became lord over France from the Norman frontier across to the Gulf of Lyons. In 1154 he ascended the English throne as Henry II. Vigorous and determined, fortunate in his marriage, his own resources, his kingship in England, it seemed certain that he would overthrow his feeble rival, and wear on his head the two crowns of France and England. Forthwith began the struggle which lasted all his life. He made Rouen his chief and favorite capital,—for he was far less English than French,—attempted Toulouse, attacked the Bretons, reduced Louis VII. to peace, getting Margaret the daughter of Louis as wife for his eldest son Henry. She brought him some frontier castles, which much strengthened his hold on Normandy. By about the year 1160 Henry II. had reached the highest limit of his almost imperial power. He had planted out his sons as vassal kings in Normandy, Anjou, Ireland; he completely overshadowed all the other princes of Europe. It was not till he tried to restrain the clergy that his troubles began. The Constitutions of Clarendon were passed in 1164; the quarrel with Becket did not tarry. The French king gladly supported Henry's foe, and the struggle lasted till Becket's murder in 1172, a crime which was fatal to the fortunes of Henry II. In 1172 Eleanor, deeming herself wronged by her spouse, set her Aquitanians in revolt against him; her sons also joined her, and Louis VII. entered once more into the strife. He was soon taught that it was folly for him to measure swords with Henry; the great Angevin monarch held firm hold of all his Continental possessions.

The fortunes of Henry II.

Then Louis in 1179, feeling himself old, caused his son Philip, then aged fifteen, to be crowned as joint-king. At the coronation of Philip Augustus at Rheims it is said that the twelve peers of France,—six laymen, six ecclesiastics,—were all present. They were the dukes of Normandy, Burgundy, and Guienne, the counts of Flanders, Champagne, and Toulouse, the archbishop of Rheims, and the bishops of Laon, Noyon, Chalons, Beauvais, and Langres.

This was the last act of this long-reigning prince, who died in 1180. He had been sole king since 1137, and in the main had done little harm if little good. He was kindly and pious, learned beyond the princes of his age; and so long as he listened to the sage counsels of Suger he reigned not amiss. In his days agriculture largely improved, lands were brought under tillage, the countryman had peace and felt some sunshine of prosperity; the lesser towns also flourished, for Louis VII. was friendly on the whole to the communal advance, and issued no less than twenty-four civic charters. His greatest misfortune was his spouse, his greatest blunder his crusade; for a weak well-meaning man, it is wonderful how little harm he did. As so often occurs in history, he is the mean prince between two great men; we are obliged to contrast him with Louis VI., his active and able father, and with Philip Augustus, his proud, unscrupulous, and vigorous son. It is under these three princes that the French feudal monarchy takes definite shape.

Philip Augustus, cold and patient, proud and firm, without high impulses, lacking in enthusiasm, ungenerous, sometimes even deceitful and mean, a hard man and terrible rather than noble, a man who trusted in law and cared little for justice, was clearly a formidable person. His reign of forty-three years—just the same in length with that of his father—could not fail to have great influence on the fortunes of his country. History must favor him: the contrasts, "Louis the Young," his father, and John Lackland of England, are all entirely in his favor; the rivalry between the houses of Capet and Anjou turned to his advantage; the sum of results in his reign leaves on us the sense of greatness and strength, supported by good fortune.

Philip Augustus.

Philip Augustus began his long reign with acts of vigor and severity. His gentler father could not be persuaded to touch the Jews: but Philip banished them from the realm in 1182; he issued edicts, which he also enforced, against vices, and against heretics; in all he showed signs of a strong and unpleasant character. In 1185 he began with his neighbors,—had a little war with the count of Flanders, which won him the county of Vermandois and the border city of Amiens, key of the line of the Somme. Next, he fell to blows with the duke of Burgundy, and reduced him to submission. In 1186 we find him holding peaceful discussions with his most formidable neighbor, the duke of Normandy, and beginning a movement which after long years ended in the annexation of the proud duchy to the kingdom. Richard Cœur de Lion was too turbulent a prince to let things long remain at peace. Disputes sprang up as to frontier districts, such as the Vexin, and as to the falling-in of the Breton dukedom. Sometimes with Henry II., sometimes with his rebellious son, Philip was constantly conferring or quarrelling, though the grandeur of the old king of England overawed his young rival, whose policy with respect to him looks to us timid and irresolute, and sometimes mean. So things went on till 1187, when tidings of the fall of Jerusalem seemed to still all lesser controversy; and Philip and Henry, meeting once more under the Gisors oak, made peace and took the cross. All Europe was stirred into action; the emperor Frederick Barbarossa and the chief German dukes, Richard Cœur de Lion, with all the greater lords and barons, prepared to set forth. But ere they went troubles again broke out between the two kings, and Henry, deserted by his sons, was forced to a shameful peace, which involved the cession of Berri to France, and involved also the death of the broken-hearted monarch (1189).

1182-1199.

With the death of Henry II. we feel that we have passed the highest point in the fortunes of the house of Anjou, and that now the Capets must prevail in France.

Now followed the third crusade, which brought much barren glory to the new king of England, which caused the death of Barbarossa, drowned in the little river Cydnus (Carasu) in Cilicia, which added nothing to the honor or the power of Philip Augustus. He saw the taking of Ptolemais, and ere long, wearying of the uncongenial sport, handed over his Frenchmen to his kinsman the duke of Burgundy, and, swearing not to molest Richard's territories, set sail for Europe. He broke his word at once by allying himself with John, and fanning that mean prince's jealousy of his nephew Arthur of Brittany. When tidings reached Philip that Richard had been taken prisoner by Leopold of Austria, the French king did not hesitate at once to take advantage of his misfortune. He attacked Normandy, and, in concert with John, laid siege to Rouen. When, however, the emperor let Richard go free, his onward course was checked, and the war ended by a truce, Philip becoming master of Auvergne and withdrawing his hand from Normandy (1196). Richard at once did his best to raise up obstacles against him. Now rose the noble walls of Château Gaillard to protect Rouen, which, since Gisors had returned to France, was entirely open towards the east. For a while his warlike genius and skill in fortification seemed to check the French king's ambition. His end, however, was at hand; besieging Chalus, he was wounded by an arrow, and the wound was fatal. He died in 1199, leaving his crown to his brother John, whose weakness was sure to be Philip's opportunity. Of all the great house of Anjou none remained save John and little Arthur of Brittany; it was clear that ill-will must spring up between these two princes, and what so clear as that Philip would be ready to pluck advantage from the quarrel? At once, on John's accession, while England and Normandy accepted him, the other French-speaking districts, Anjou, Maine, Poitou, and Touraine, as well as Brittany, declared for Arthur, and placed themselves under the willing protection of Philip, who suggested a fair division—the French-speaking lands, including Normandy, for Arthur, England for King John. It was clearly impossible that John, with his un-English character and bringing up, should accept banishment to the island; war broke out, and Philip, in Arthur's name, seized on Brittany, and presently making peace with John, abandoned Arthur's cause. He made his profit out of the short war and peace, no doubt; but the true reason for his peaceable humor was his controversy with the pope, who had interfered with him over the old royal difficulty, his wife. Philip had sent away Ingeborg, his Danish queen, and had

The third crusade.

1200-1214. taken the fair Agnes of Meran. The pope, Innocent III., came to the rescue of the wronged lady, threatening Philip with excommunication and France with interdict. In 1200 he carried out his threat. The proud king struggled a while against papal interference; in the end he found it better to yield, and replaced Ingeborg on his throne. He was now ready to interpose once more between King John and hapless Arthur. In 1202 John gave him the chance. Arthur fell into his uncle's hands, was lodged in the castle at Rouen, and from that day vanished from life and history. His subjects at once rose in his behalf, and Philip marched southwards into Poitou. Having there secured his authority as Arthur's avenger, he turned north again and swiftly fell on Normandy. In the autumn of 1203 he laid siege to Château Gaillard, then defended by Roger de Lacy, constable of Chester. In vain did Innocent III. interfere between the kings. Philip now had justice and an outraged people on his side, and soon showed the pope that his intervention would not be allowed. Early in 1204 the great fortress fell. John, who had done nothing to avert the blow, had actually fled from his capital Rouen to England; from that day onward the centre of the kingdom was destined to be at London; the controversy for precedence between England and Normandy on that day came to an end. Philip passed triumphantly through Normandy. Poitou, Touraine, Anjou, also placed themselves in his hand, and King John retained a few places near the coast, with Rochelle as his one port of entry into France. Brittany, hitherto a fief of Normandy, henceforth must pay homage to the conqueror of that duchy.

The Albigensian crusade.

The next decade of years was marked by the beginning of great troubles in the south. There flourished sciences, literature, the arts; there men thought and spoke as they would; there the Jew and the infidel could live side by side with the Christian; there the church was weak and feudalism had no hold. The earlier efforts of Innocent III. bearing little fruit, in 1208 his vengeance fell on Raymond of Toulouse, and the Albigensian crusade began. The pope called on the French to help; and, though Philip himself did not interfere, he did not hinder crowds of his ecclesiastics and lay lords from taking the cross. Under the command of St. Dominic, the spiritual power plied its merciless arms; led by Simon of Montfort the elder, the lay sword vigorously supported the thunders of the church. Languedoc was laid waste, her fair culture trodden in the dust, her ancient cities, centres of civilization, burnt and ravaged. No war was ever more atrocious; the grim fanaticism of Simon ably seconded the pitiless orthodoxy of Dominic. The war raged till 1212, when Raymond was forced to flee into Aragon, while Montfort seemed certain to found for himself a great southern principality. The attempt of Peter of Aragon to drive him out, and to keep back the northerner from his borders, ended in that prince's defeat and death, and by 1215 Simon was lord of almost all the south; the great Lateran Council held in that year, confirmed him and his crusaders in possession of it. The two Raymonds of Toulouse, father and son, now made yet one more effort; the south was weary of the foreign invader, and made common cause with them; Toulouse rose against Simon, and in the siege which followed he was killed (1217). Philip now interfered at last, with an army reinforcing Amaury, Simon's son; the heroic south resisted gallantly, and the elder Raymond was able to bequeath his whole inheritance to his son. For a few years the invader and the persecutor were driven out of the land.

Meanwhile Philip had not been idle; the crusade was doing his work in the south, and the incapacity of King John of England gave him an opening in the north. In both he showed himself as the chief friend of the papacy; but while in the south he mainly contented himself with passive approval till towards the end of the struggle, in the north he set himself to take an active part, and in 1213 called an assembly of barons at Soissons, to prepare for an invasion of England. From this, however, he was stayed by Pandulf, the pope's legate, and turned his hand instead against Ferrand of Flanders, who had refused to obey his summons. His fleet, sent up to occupy the mouth of the Scheldt, was attacked and ruined by English ships, and Philip got but a poor consolation by pillaging some of the wealthy Flemish cities. In 1214 he had to face a grand coalition of enemies. Ferrand was supported on one hand by the king of England, on the other by the emperor Otho,—the former undertaking to attack Poitou, the latter to enter Flanders. The moment was very critical for Philip; his barons went in heart with the feudal lords against their royal master. John, however, though he landed at La Rochelle and took Angers, fell back on the first resistance, and was of no avail. Otho entered Flanders, and Philip came up to meet him. They met at Bouvines (29th Aug 1214), and there Philip won a great victory over Flemings, Germans, and English. Otho fled, a ruined man; Ferrand of Flanders, the earl of Salisbury, and Renaud of Boulogne were prisoners. To the battle of Bouvines are due on the one hand the firm establishment of the French monarchy, on the other the security of English baronial liberties by Magna Charta. Philip had now secured the west, weakened the south, and crushed the great coalition of the north. Little remained for him but to consolidate his power. He had sent his son Louis into England to support the barons against King John; when, however, John died the English barons and people refused to depose his son Henry III.; Louis had to withdraw to France. 1214-1231.

Character of Philip Augustus.

For the remainder of his life Philip lived in peace, save when he interposed to support the northern invaders of the south of France. His government was wise and tranquil; he allied himself closely with the church throughout; and when he died in 1223 he left a large part of the fortune he had amassed to his clergy, while he took care to hand his great territories unbroken to his son Louis VIII.

Philip Augustus was, as has been said, "a great king, not a great man." His name survives to France in the memory of the fact that by conquering Normandy he made royalty great. He was also king of Paris, for he built the present Notre Dame, erected her market, paved and cleansed the streets, built almshouses, secured a good water-supply, strengthened her defences by making new walls around the city; above all, he sanctioned and supported, if he did not actually found, her university. To his action in this and to the abatement of grudges between France and England we owe it that the first of English universities, Oxford, drew her earliest inspiration from Paris, and was established in the main on the same lines. New branches of study were cultivated; medicine, experimental philosophy, and law began to occupy the minds of men. And Philip was, by character and knowledge of his position, a lawyer. If great men are noted for their passion for justice, great kings are irresistibly attracted towards law; and Philip, with his delight in the newly-revived Roman law, stands fair comparison with the "English Justinian," Edward I. For the Roman law provided high sanction for his kingly claims,—a sharp instrument for the punishing of popes and princes. The king's sagacity carried him safely through great crises of the fate of royalty, through his struggles with the papacy and with the powerful feudal princes. Besides Normandy and Brittany, Flanders, Champagne, and Languedoc had to bow before his authority; while he reduced the power of the great lords, he actually had the courage to give them a special organization by establishing the great court of peers, whom he called together to help him in condemning King John. Proud, cold, and sagacious, Philip is among the greatest of the founders of the later French royalty.

Louis VIII.

His successor Louis VIII. reigned only three years (1223–1226). In an attempt to carry out the wishes of the church in the south, and to crush the heretics, he was attacked by camp fever after the siege of Avignon. He died, leaving behind him a young son Louis, then twelve years old, under the care of his vigorous and ambitious widow Blanche of Castile. The early years of the reign of Louis IX. were spent in ceaseless strife. The great lords thought that they discerned in the accession of a child their watched-for opportunity; but the vigor of Queen Blanche, and the hearty support of Paris and the towns, made them accept the treaty of St. Aubin du Cormier in 1231; the king's position was secured, and his troubles came to an end. Henry III. of England, on whose aid the princes had depended, failed them, and they were fain to make the best terms they could. This struggle was followed by a long contest with the bishops, in which the young king learnt lessons which stood him in good stead; it is probably to this contest that he owed the successes of his later life,—that he was able, as few kings had been, to combine earnest devotion with an

Saint Louis.

1242-1249. absolute superiority to priestly rule and influence. In many ways circumstances proved friendly to the young king. Theobald of Champagne, becoming king of Navarre, sold some valuable fiefs to Louis; the Treaty of Meaux a little time before had closed the contest between north and south by the submission of Raymond VII., count of Toulouse; one after another the leading nobles ceased to compete with the crown. During all these early years of his reign Louis had constant help from the strong hand of his mother; imperious and masterful, she ruled him and the land thoroughly and successfully. He stood wisely clear of the great struggle which went on all these years between Frederick II. and the papacy.

In 1242 came the king's first serious warfare. He had tried to set his brother Alphonse over Poitou and Auvergne, whereon the reluctant nobles called in Henry III. to their help. Henry came with a small army and large supplies. Louis, however, hastened down to meet him, reduced all the country north of the Charente, defeated him twice, and that incompetent prince fell back to Bordeaux, where he wasted his time and means. In 1243 he was obliged to make his peace with Louis, and gladly withdrew to England. At this same time, Raymond VII. also rose against the king; he was, however, soon reduced to order. In 1244 the last of the Albigensians perished at Mont Segur, the whole of them preferring to be burnt rather than retract their opinions. Fitly to end this period of his life, Louis IX. issued an edict that no lord should hold fiefs under both the king of France and the king of England; almost all his lords abandoned their English allegiance, and rallied round him alone. This movement made the distinction between English and French feeling stronger, and rendered the wars of the future more really national. In 1245 Charles of Anjou, the king's brother, wedded the great heiress of the south, the Countess Beatrice. This fortunate marriage closed the independent political life of Provence, which thus passed to the house of Anjou; its fortunes were consequently long bound up with those of the kingdom of Sicily.

Up to this time Louis IX., being mostly under the command of his mother, had shown little sign of greater qualities; now came the crisis which called them forth. He had acted with singular prudence in the contests which surrounded his earlier years, had held aloof from the investiture wars, had stood clear of eastern complications, had kept his barons quiet. Now, however, he was no longer to confine himself to affairs at home; the East, with its dazzling attractions of religion and romance, called for his care; by going thither he would escape from the conflict nearer home, the internecine struggle between the emperor Frederick II. and the papacy, under Innocent IV., and would fulfil the devout longings of his pious spirit by succoring the afflicted Christians against the Moslem and the Tartar. Louis took the cross in 1244, with his three brothers, Robert of Artois, Alphonse of Poitiers, and Charles of Anjou; at Christmas, 1245, "the day of new clothes" when his courtiers donned their new-made cloaks, they found the significant cross on every shoulder; still nothing was done a while, for in truth France was rightly very reluctant to embark in eastern politics. It was not till 1248 that Louis set sail from Aigues-Mortes for Cyprus, the rendezvous for this crusade. The sultan of Cairo was now lord of Palestine; the Tartars had destroyed the power of the sultan of Konieh; Jerusalem was a defenceless heap of ruins. It therefore seemed best to attack the Moslem power at its centre; and this crusade, instead of making for Constantinople, Asia Minor, and Jerusalem, began on the other side by an attack on the headquarters of the Mahometan power in Egypt. In June, 1249, the good king landed on the Egyptian shore and took Damietta without a blow. There the crusaders lingered till the place became a Capua to them; for idleness brought on debauch, and debauch disease; and fever, the avenger of war, soon attacked the army. After nearly six months of ruinous delay the king marched southward, fought the heroic though inconclusive battle of Massourah, which finally arrested his farther progress towards Cairo; and after another long delay the Christians were obliged to retire towards Damietta. On the retreat the whole army was taken by the Saracens, who massacred the common folk and held the nobles to ransom. Louis had to surrender Damietta, and to pay a heavy sum before he could sail from Egypt; and even so, he was obliged to leave behind a vast number of Christian captives. Of the remnant of his great host only about one hundred knights followed him to Palestine,—a fever-stricken company depressed with ill-fortune and defeat; the rest made for home. Louis landed at Ptolemais, one of the very few cities left in Christian hands, and found little to restore his confidence or the spirits of his followers. He remained four years in the Holy Land, chiefly engaged in arranging the ransom of his captive soldiers; he freed all the prisoners left in Egypt, strengthened the few places held by the Christians, and was almost unmolested by the Saracens, who were nearly as weak in Palestine as he was. At last, on the death of his noble mother Blanche in 1253, finding that his army had almost entirely melted away, that he could not hope to achieve anything in Palestine, and that he was much wanted at home, he set sail at last, and reached France in September, 1254, a sorrowful and beaten man. The one bright spot in his crusade was the development of the king's character; men recognized in him the hero and saint, and what was least wise in his career has covered him with greatest glory. 1253-1270.

Still, the best part of his reign was to come; nowhere had better government ever been seen in Europe than that which Louis carried on for the sixteen peaceful years which followed his first crusade. Some of his acts have been sharply criticised; all, however, were in the direction and interests of peace. In 1258 he made treaty with King James of Aragon, settling all points of lordship at issue on that frontier; in 1259 he came to terms with Henry III. of England, yielding to him the Limousin, Perigord, and parts of Saintonge, in return for Henry's abandonment of all claims on the rest of France. Louis hoped thereby to secure perpetual peace and amity between the two countries. At home all his action tended to good. His noble character, his recognized justice, fairness, and holiness, enabled him to intervene as a peacemaker between his lords; there was in him a generous vein of sympathy and love for his people, which prompted him to succor those in distress, to govern well because mercifully, to rule in church and state as one who loved justice and judgment, and to whom the welfare of his subjects was a chief object and the aim of life.

Throughout it all, however, he still cherished in heart the enthusiasm of the crusading spirit. He had failed once; he would try again for the faith against the miscreant. And so in 1267 he again took the cross, and in 1270, in spite of the remonstrances of his wisest friends, set sail once more,—this time not for Constantinople or Palestine, or even Egypt, but for Tunis. The probable motive of this attack on Tunis was the ambition of the king's brother, Charles of Anjou; for a strong Saracen power on that shore was always a menace to his newly acquired Sicilian and Neapolitan kingdom. Be that as it may, the expedition, as a crusade, attacking the very outskirt instead of the heart of the Moslem strength, was foredoomed to fail. The failure came from the beginning; hardly were the crusaders landed when fever and dysentery set in. The king caught it and died. With him ended the crusading era (St. Bartholomew's day, 1270).

Louis the Saint had been a great king, as well as a pious and a virtuous one; in this he stands almost alone in French history. Nor was he backward in matters of learning; his age is an epoch in the growth of French literature. The university of Paris under his care rose to high repute; the greatest learned men in Europe are connected with this period of its history; Albertus Magnus, Roger Bacon, Saint Thomas Aquinas, all studied at Paris. In his reign Robert of Sorbon (1252) founded his college for ecclesiastics, and the famous Sorbonne began its long career. Literature flourished in prose and poetry; the arts took a fresh beginning; Saint Louis raised that chief ornament of architecture in Paris, the Sainte Chapelle.

Above all, the king was notable for his justice, and the use he made of the law. The law, the natural ally of the throne in France, came to his help: by its aid he attacked or undermined feudal privileges; he established a higher jurisdiction than that of the feudal courts, appointed itinerant justices, insisted on a real right of appeal in last resort to himself, curtailed the powers of baronial courts, and the freedom of baronial warfare, and finally rendered the king's "parliament" a great law-court. His legists issued a new code, the "Establishments of Saint Louis," in which feudal custom was largely modified by the Roman law. The king also increased and consolidated the royal domain, acquiring

1270-1297. property whenever it was possible, and administering throughout a uniform rule of law. The kingdom also was greatly enlarged by his care; a large portion of the lands of the count of Toulouse, Chartres also, Blois, Sancerre, Macon, Perche, Arles, and Foix, all became his; Normandy was formally made over to him by Henry III. His brother Charles of Anjou not only secured Provence for himself, and eventually for France, but by finally conquering the last of the Hohenstauffen secured, a doubtful good, French influence in southern Italy. Frederick II. had died in 1250; Manfred, his base-born son, became king of Naples; and Charles, invoked against the hated Hohenstauffen by Pope Urban IV., defeated Manfred in 1266, and his nephew Conradin, the last of the house, in 1268, thereby becoming king of the Two Sicilies. Then began that system of traditional savageness and cruelty which characterizes all the mediæval relations of France with Italy. The "Pragmatic Sanction of Saint Louis" is placed in the year 1269, and (if genuine, which is doubtful) laid down the maxims on which the liberties of the Gallican Church are founded. The king and his lawyers were certainly quite as unwilling to allow the church as the baronage to win independence, and to plunge the kingdom into confusion.

Philip III. Philip III., the Rash, succeeded on his father's death,—an unlearned, weak man, whose history is uneventful, save that it is the period in which the foreign influence of France received a great check through the Sicilian Vespers (1282), which deprived Charles of Anjou of his throne, in spite of the urgent efforts of the papacy. Philip was also unlucky in his dealings with Aragon; on his return from an expedition into Spain, in which he ruined a great fleet and army, he fell ill and died, in 1285.

Philip IV., the Fair. In 1274 the count of Champagne, Henry of Navarre, had died, leaving one child, a girl, three years old. She was affianced in 1276 to Philip, son of Philip III., and Navarre was thus brought into the French kingdom. And so it fell out that when Philip IV., the "Fair," that proud young prince, succeeded, he was already master of the fortunes of a larger France than had ever yet been known. Lawyers surrounded his throne from the beginning; he was the fitting leader in a great revival of the Roman law, that terrible enemy to feudalism and the mediæval papacy.

In the beginning of his reign Philip IV. worked by means of his lawyers; they put a stop, in large part, to clerical administration; the parliament fell completely into their hands, and ere long (1302) was permanently fixed at Paris, and became the chief legal authority in the realm. The king's fiscal necessities threatened to overwhelm him; the older system of sustenance, based on the royal domain, had completely given way. To this reign France owes the first beginnings of a formidable system of taxation; to Philip IV. is due the ill-sounding maltôte, the "ill-levied" tax. He seized what he could, wrung the Jews, confiscated the wealth of the Templars, turned everything into hard cash, sold privileges to towns, tampered with the coin; by sumptuary laws he succeeded in taxing even his nobles. This state of need and greed brought on the great strife of his reign, the quarrel with Boniface VIII. It was a many-sided struggle,—that of the temporal against the spiritual authority; that of the civil against the canon law; that of the lawyers against the clergy; that of France against Italy. Soon after his accession in 1294 Boniface VIII. had tried to mediate between the two great lawyer-princes, Edward I. of England and Philip the Fair. The kings took it much amiss; and when in 1296 Boniface issued the famous bull Clericis laicos, which forbade the clergy to pay taxes to the civil power unless the papal power sanctioned them, Philip answered by an ordinance which prohibited the export of valuables of all kinds from the kingdom. The pope's reply created open breach, and Philip let loose his lawyers on the Italian priests. The strife, however, was speedily allayed, and a seeming reconciliation took place over the canonization of Louis IX., which occurred on the anniversary of his death, St. Bartholomew's day, 1297. Boniface also mediated successfully between the French and English kings, securing a large part of Aquitaine to France. It was, however, but a truce, which enabled Philip, not only to win this portion of Aquitaine, but to attach to himself the friendship of the duke of Brittany, and to occupy Flanders. So things went on till the year of jubilee, 1300, when Boniface seemed to have been lifted up above all the princes of the earth. 1300-1314. About this time the pope nominated as his legate in France Saisset bishop of Pamiers, an open foe to the French crown. He made use of his new authority to stir up strife in the south, and Philip IV. arrested him at Pamiers as a traitor. Forthwith the old strife broke out again,—a terrible war of words ensuing, lawyer's pamphlets met by papal bulls, which affirmed (as in the great Ausculta fili bull) the supremacy of the pope over all kings. The king threw himself on the patriotism of his people, and called together the three Estates of France, nobles, clergy, and burghers, to sit at Paris and consider his grievances. The nobles and burghers spoke out bravely for their king against the papal claims; the clergy applied for leave to attend the council convoked at Rome. Their request was refused; if they went their goods would be forfeited.

Just before this had broken out a revolt at Bruges (1302), in which the enraged Flemish had risen on and destroyed their new masters; the French nobles, eager for vengeance and spoil, hastily assembled and marched northwards, under the guidance of Robert of Artois; hard by Courtrai the Flemish burghers, led by Guy of Namur, inflicted on them the worst defeat ever yet sustained by French chivalry; the "Day of the Spurs" was a fitting name for a carnage after which four thousand gilt spurs were hung as trophies in Courtrai cathedral.

The foremost men of France had perished in a ditch; and though for the moment Boniface rejoiced, and deemed his rival to be ruined, in the event this overthrow of feudalism turned completely to the king's advantage. The bishops, thinking also that the royal power was broken, set forth for Rome. For the moment even Philip seemed to lose confidence, and the papacy enunciated its highest claims. The king, however, soon recovered force; he made peace with Edward of England, ceding Guienne to him, and marrying his daugher Isabella to the younger Edward. It was now that he debased the coin and imposed the odious maltôte. William of Nogaret was sent to Italy to lodge with the pope the king's appeal from his authority to a general council and a legitimate pope. In reply the pope announced that he was about to lay an interdict on the kingdom. Then Nogaret called in the help of the Colonnas, the family foes of Boniface, who gladly seized the pope at Anagni; the mortifications and privations of the moment were too much for the aged pontiff, and though the Romans delivered him from captivity, he gave way and died. Thus was Philip IV. delivered from his worst antagonist. In 1304 he made peace with the Flemish, giving up his claim to Flanders, and drawing himself together to complete his victory over the papacy. In 1305 he succeeded in forcing on the conclave of cardinals his nominee Bertrand de Goth, archbishop of Bordeaux, who became pope as Clement V., and was consecrated at Lyons; then the great "captivity" began. Clement, as the price of his elevation, cancelled the bulls of Boniface, and pardoned the king's lawyers; he created nine French cardinals, so as to secure the king's influence in the conclave. Philip pressed him to condemn the memory of Boniface, and to consent to the ruin of the Templars; this, however, the poor pope avoided, with pretexts sufficient for the time. When Philip pressed him still more closely, for the Templars were rich and unpopular, and busy rumor had darkened their character with fancied details of unholy crimes, Clement endeavored to escape by flight. The king arrested him, and brought him back to Poitiers. In 1309 this miserable pontiff was allowed to travel southward, though Philip absolutely refused to let him return to Rome, and was fain to fix his seat at Avignon on the Rhone, a city then in the possession of Charles V. of Anjou, and hard by the papal county of the Venaissin. Here the papacy abode in discredit and subjection to the French crown for seventy years.

The condemnation of Boniface was deferred a while; it was but a barren revenge, and the Templars were a richer spoil. In spite of their heroic defence and resistance, they were condemned in 1310, and perished as martyrs to their cause. In 1312 the abolition of the Order was decreed by Clement V., and their wealth, in large part, fell into the king's hands. These gloomy years fitly close the reign of Philip IV.; he died in 1314 from the effects of a hunting accident. He had not added much to the dimensions of the kingdom; the addition of Lyons (1312) was

1314-1336. his greatest achievement in this way; he had immensely increased the royal authority at home, and had triumphed over the papacy, the conqueror of the empire.

The sons of Philip the Fair.

Philip IV., died, leaving three sons, who all succeeded him. In the house of Capet, there had hitherto been alternately weak and strong monarchs; now, however, the vigor of the race was gone. The reign of Louis X., "le Hutin," the quarreller, was brief and unimportant; it was naturally enough a time of reaction, in which things seemed to fall back into feudal anarchy and weakness. There was great distress and famine in France in 1315–1316, and a campaign against the Flemings was a complete failure. In June, 1316, Louis died, leaving his queen with child. She bore a son, named John, who lived seven days, being during that time nominal king of France; on his death, the late king's next brother Philip V., "the Tall," succeeded to the throne, basing his claims on the so-styled Salic law of France, according to which "no woman could succeed to Salian soil," and, *a fortiori*, no woman could succeed to the Salian, that is, to the French throne. He reigned six miserable years, without credit, though he published not a few ordinances. He died in 1322, and was succeeded by his youngest brother Charles IV., "the Fair," whose six years' reign ended in 1328. With him the direct line of the House of Capet came to an end,—cursed with barrenness and incapacity, men held, by the curse of the dying Templars.

The house of Valois.

Charles, count of Valois, was the younger brother of Philip the Fair, and therefore uncle of the three sovereigns lately dead. His eldest son Philip had been appointed guardian to the queen of Charles IV.; and when it appeared that she had given birth to a daughter and not a son, the barons, joining with the notables of Paris and the good towns, met to decide who was by right the heir to the throne, "for the twelve peers of France said and say that the crown of France is of such noble estate that by no succession can it come to a woman nor to a woman's son," as Froissart tells us. This being their view, the baby daughter of Charles IV. was at once set aside, and the claim of Edward III. of England, if, indeed, he ever made it, rested on Isabella of France, his mother, sister of the three sovereigns. And if succession through a female had been possible, then the daughters of those three kings had rights to be reserved. It was, however, clear that the throne must go to a man, and the crown was given to Philip of Valois, founder of a new house of sovereigns.

Philip VI.

The new monarch was a very formidable person. He had been a great feudal lord, hot and vehement, after feudal fashion; he was now to show that he could be a severe master, a terrible king. He began his reign by subduing the revolted Flemings on behalf of his cousin Louis of Flanders, and having replaced him in his dignities, returned to Paris, and there held high state as king. And he clearly was a great sovereign: the weakness of the late king had not seriously injured France; the new king was the elect of the great lords, and they believed that his would be a new feudal monarchy; they were in the glow of their revenge over the Flemings for the day of Courtrai; his cousins reigned in Hungary and Naples, his sisters were married to the greatest of the lords; the queen of Navarre was his cousin; even the youthful king of England did him homage for Guienne and Ponthieu. The barons soon found out their mistake. Philip VI., supported by the lawyers, struck them whenever they gave him opening; he also dealt harshly with the traders, hampering and all but ruining them, till the country was alarmed and discontented. On the other hand, young Edward of England had succeeded to a troubled inheritance, and at the beginning was far weaker than his rival: his own sagacity, and the advance of constitutional rights in England, soon enabled him to repair the breaches in his kingdom, and to gather fresh strength from the prosperity and good-will of a united people. While France followed a more restrictive policy, England threw open her ports to all comers; trade grew in London as it waned in Paris; by his marriage with Philippa of Hainault, Edward secured a noble queen, and with her the happiness of his subjects and the all-important friendship of the Low Countries. In 1336 the folly of Philip VI. persuaded Louis of Flanders to arrest the English merchants then in Flanders; whereon Edward retaliated by stopping the export of wool; and Jacquemart van Arteveldt of Ghent, then at the beginning of his power, persuaded the Flemish cities to throw off all allegiance to their French-loving count, and to place themselves under the protection of Edward. In return Philip VI. put himself in communication with the Scots, the hereditary foes of England; and the great wars which were destined to last 116 years, and to exhaust the strength of two strong nations, were now about to begin. They brought brilliant and barren triumphs to England, and, like most wars, were a wasteful and terrible mistake, which, if crowned with ultimate success, might, by removing the centre of the kingdom into France, have marred the future welfare of England; for the happy constitutional development of the country could never have taken place with a sovereign living at Paris, and French interests becoming ever more powerful. Fortunately, therefore, while the war evoked by its brilliant successes the national pride of Englishmen, by its eventual failure it was prevented from inflicting permanent damage on England.

Beginnings of war between England and France.

1336-1341.

The war began in 1337, and ended in 1453; the epochs in it are the treaty of Bretigny in 1360, the treaty of Troyes in 1422, the final expulsion of the English in 1453.

The "Hundred Years' War."

The French king seems to have believed himself equal to the burdens of a great war, and able to carry out the most far-reaching plans. The pope was entirely in his hands, and useful as a humble instrument to curb and harass the emperor. Philip had proved himself master of the Flemish, and, with help of the king of Scotland, hoped so to embarrass Edward III. as to have no difficulty in eventually driving him to cede all his French possessions. While he thought it his interest to wear out his antagonist without any open fighting, it was Edward's interest to make vigorous and striking war. France therefore stood on the defensive; England was always the attacking party. On two sides, in Flanders and in Brittany, France had outposts which, if well defended, might long keep the English power far away from her vitals. Unluckily for his side, Philip was harsh and rash, and threw these advantages away. In Flanders the repressive commercial policy of the count, dictated from Paris, gave Edward the opportunity, in the end of 1337, of sending the earl of Derby with a strong fleet to raise the blockade of Cadsand, and to open the Flemish markets by a brilliant action, in which the French chivalry was found powerless against the English yeomen-archers; and in 1338 Edward crossed over to Antwerp to see what forward movement could be made. The other frontier war was that of Brittany, which began a little later (1341). The openings of the war were gloomy and wasteful, without glory. Edward did not actually send defiance to Philip till 1339, when he proclaimed himself king of France, and quartered the lilies of France on the royal shield. The Flemish proved a very reed; and though the French army came up to meet the English in the Vermandois country, no fighting took place, and the campaign of 1339 ended obscurely. Norman and Genoese ships threatened the southern shores of England, landing at Southampton and in the Isle of Wight unopposed. In 1340 Edward returned to Flanders; on his way he attacked the French fleet which lay at Sluys, and utterly destroyed it. The great victory of Sluys gave England for centuries the mastery of the British channel. But, important as it was, it gave no success to the land-campaign. Edward wasted his strength on an unsuccessful siege of Tournai, and, ill-supported by his Flemish allies, could achieve nothing. The French king in this year seized on Guienne; and from Scotland tidings came that Edinburgh castle, the strongest place held by the English, had fallen into the hands of Douglas. Neither from Flanders nor from Guienne could Edward hope to reach the heart of the French power; a third inlet now presented itself in Brittany. On the death of John III. of Brittany in 1341, John of Montfort, his youngest brother, claimed the great fief against his niece Jeanne, daughter of his elder brother Guy, count of Penthievre. He urged that the Salic law which had been recognized in the case of the crown, should also apply to this great duchy, so nearly an independent sovereignty. Jeanne had been married to Charles of Blois, whom John III. of Brittany had chosen as his heir; Charles was also nephew of King Philip, who gladly espoused his cause. Thereon John of Montfort appealed to Edward, and the two kings again met in border strife in Brittany. The Bretons

1345-1356. sided with John against the influence of France. Both the claimants were made prisoners; the ladies carried on a chivalric warfare, Jeanne of Montfort against Jeanne of Blois, and all went favorably for the French party till Philip, with a barbarity as foolish as it was scandalous, tempted the chief Breton lords to Paris and beheaded them without trial. The war, suspended by a truce, broke out again, and the English raised large forces and supplies, meaning to attack on three sides at once,—from Flanders, Brittany, and Guienne. The Flemish expedition came to nothing; for the people of Ghent in 1345 murdered Jacques van Arteveldt as he was endeavoring to persuade them to receive the Prince of Wales as their count; and Edward, on learning this adverse news, returned to England. Thence in July, 1346, he sailed for Normandy, and landing at La Hogue overran with ease the country up to Paris. He was not, however, strong enough to attack the capital, for Philip lay with a large army watching him at St. Denis. After a short hesitation Edward crossed the Seine at Poissy, and struck northwards, closely followed by Philip. He got across the Somme safely, and at Crécy in Ponthieu stood at bay to await the French. Though his numbers were far less than theirs, he had a good position, and his men were of good stuff; and when it came to the battle, the defeat of the French was crushing. Philip had to fall back with his shattered army; Edward withdrew unmolested to Calais, which he took after a long siege in 1347. Philip had been obliged to call up his son John from the south, where he was observing the English under the earl of Derby; thereupon the English overran all the south, taking Poitiers, and finding no opposition. Queen Philippa of Hainault had also defeated and taken David of Scotland at Neville's Cross.

The campaign of 1346–1347 was on all hands disastrous to King Philip. He sued for and obtained a truce for ten months. These were the days of the "black death," which raged in France from 1347 to 1349, and completed the gloom of the country, vexed by an arbitrary and grasping monarch, by unsuccessful war, and now by the black cloud of pestilence. In 1350 King Philip died, leaving his crown to John of Normandy. He had added two districts and a title to France: he bought Montpellier from James of Aragon, and in 1349 also bought the territories of Humbert, dauphin of Vienne, who resigned the world, under influence of the revived religion of the time, a consequence of the plague, and became a Carmelite friar. The fief and the title of dauphin were granted to Charles, the king's grandson, who was the first person who attached that title to the heir to the French throne. Apart from these small advantages the kingdom of France had suffered terribly from the reign of the false and heartless Philip VI. Nor was France destined to enjoy better things under John "the Good," one of the worst sovereigns with whom she has been cursed. He took as his model and example the chivalric John of Bohemia, who had been one of the most extravagant and worthless of the princes of his time, and had perished in his old age at Crécy. The first act of the new king was to take from his kinsman, Charles "the Bad" of Navarre, Champagne and other lands; and Charles went over to the English king. King John was keen to fight; the States-General gave him the means for carrying on war, by establishing the odious "gabelle" on salt and other imposts. John hoped with his new army to drive the English completely out of the country. Petty war began again on all the frontiers,—an abortive attack on Calais, a guerilla warfare in Brittany, slight fighting also in Guienne. Edward in 1355 landed at Calais, but was recalled to pacify Scotland; Charles of Navarre and the duke of Lancaster were on the Breton border; the Black Prince sailed for Bordeaux. In 1356 he rode northward with a small army to the Loire, and King John, hastily summoning all his nobles and fiefholders, set out to meet him. Hereon the Black Prince, whose forces were weak, began to retreat; but the French king outmarched and intercepted him near Poitiers. He had the English completely in his power, and with a little patience could have starved them into submission; instead, he deemed it his chivalric duty to avenge Crécy in arms, and the great battle of Poitiers was the result (19th September, 1356). The carnage and utter ruin of the French feudal army were quite incredible; the dead seemed more than the whole army of the Black Prince; the prisoners were too many to be held. The French army, bereft of leaders, melted away, and the Black Prince rode triumphantly back to Bordeaux with the captive King John and his brave little son in his train. A two years' truce ensued; King John was carried over to London, where he found a fellow in misfortune in David of Scotland, who had been for 11 years a captive in English hands. The utter degradation of the nobles, and the misery of the country, gave to the cities of France an opportunity which one great man, Étienne Marcel, provost of the traders at Paris, was not slow to grasp. He fortified the capital and armed the citizens; the civic clergy made common cause with him; and when the dauphin Charles convoked the three Estates at Paris, it was soon seen that the nobles had become completely discredited and powerless. It was a moment in which a new life might have begun for France; in vain did the noble order clamor for war and taxes,—they to do the war, with what skill and success all men now knew, and the others to pay the taxes. Clergy, however, and burghers resisted. The Estates parted, leaving what power there was still in France in the hands of Étienne Marcel. He strove in vain to reconcile Charles the dauphin with Charles of Navarre, who stood forward as a champion of the towns. Very reluctantly did Marcel entrust his fortunes to such hands. With help of Lecocq, bishop of Laon, he called the Estates again together, and endeavored to lay down sound principles of government, which Charles the dauphin was compelled to accept. Paris, however, stood alone, and even there all were not agreed. Marcel and Bishop Lecocq, seeing the critical state of things, obtained the release of Charles of Navarre, then a prisoner. The result was that ere long the dauphin-regent was at open war with Navarre and with Paris. The outbreak of the miserable peasantry, the Jacquerie, who fought partly for revenge against the nobles, partly to help Paris, darkened the time; they were repressed with savage bloodshed, and in 1358 the dauphin's party in Paris assassinated the only great man France had seen for long. With Étienne Marcel's death all hope of a constitutional life died out from France; the dauphin entered Paris, and set his foot on the conquered liberties of his country. Paris had stood almost alone; civic strength is wanting in France; the towns but feebly supported Marcel; they compelled the movement to lose its popular and general character, and to become a first attempt to govern France from Paris alone. After some insincere negotiations, and a fear of desultory warfare, in which Edward III. traversed France without meeting with a single foe to fight, peace was at last agreed to at Bretigny in May, 1360. By this act Edward III. renounced the French throne, and gave up all he claimed or held north of the Loire, while he was secured in the lordship of the south and west, as well as of that part of northern Picardy which included Calais, Guines, and Ponthieu. The treaty also fixed the ransom to be paid by King John.

John "the Good."

Étienne Marcel.

The peace of Bretigny.

1356-1364.

France was left smaller than she had been under Philip Augustus, yet she received this treaty with infinite thankfulness; worn out with war and weakness, any diminution of territory seemed better to her than a continuance of her unbearable misfortunes. Under Charles, first as regent, then as king, she enjoyed an uneasy rest and peace for 20 years. The monarchy was disgraced by failure and captivity; the nobles, weakened and discredited in war and peace, headed by factious and self-seeking lords, could offer no hope for France; the cities had shown, during the effort of Marcel, that rare man of energy and genius, that they were unfit to take the command; the Jacquerie had declared the peasantry to be wretched and powerless; the black death with equal hand had smitten all, and had shown with lurid light the scandalous manners of the Avignon papacy, the want of patriotic or religious energy in the clergy; the country was pitilessly ravaged by the free companies, the inheritance of the war. In all Europe it was a dark and gloomy time; in France men might well despair. King John, after returning for a brief space to France, went back into his pleasant captivity in England, leaving his country to be ruled by the regent the dauphin. In 1364 he died, and Charles V., "the Wise," became king in name, as he had now been for some years in fact. This cold, prudent, sickly prince, a scholar who laid the foundations of the great library of Paris by placing 900 MSS. in three chambers in the Louvre, had nothing to dazzle the ordinary eye; to the timid spirits of that age he seemed to be a malevolent wiz-

Charles V.

1364-1378. ard, and his name of "Wise" had in it more of fear than of love. Yet he was a successful prince for the times; he discerned that nothing could be gained by fighting battles,—that Ennius had given him the clue to victory in describing Fabius as one who "cunctando restituit rem;" and he had the passive coldness of heart needful to carry out such a plan. He also is notable for two things: he reformed the current coin, and recognized the real worth of Du Guesclin, the first great leader of mercenaries in France, a grim fighting-man, hostile to the show of feudal warfare, and herald of a new age of contests, in which the feudal levies would fall into the background. The invention of gunpowder in this century, the incapacity of the great lords, the rise of free lances and mercenary troops, all told that a new era had arrived. It was by the hand of Du Guesclin that Charles overcame his cousin and namesake Charles of Navarre, and compelled him to peace. On the other hand, in the Breton war which followed just after, he was defeated by Sir John Chandos and the partisans of John of Montfort, who made him prisoner; the treaty of Guerande which followed gave them the dukedom of Brittany; and Charles V., unable to resist, was fain to receive the new duke's homage, and to confirm him in the duchy. The king did not rest till he had ransomed Du Guesclin from the hands of Chandos; he then gave him commission to raise a paid army of freebooters, the scourge of France, and to march with them to support, against the Black Prince, the claims of Henry of Trastamare to the crown of Castile. Successful at first, by help of the king of Aragon, he was made constable of Spain at the coronation of Henry at Burgos; Edward the Black Prince, however, intervened, and at the battle of Najara (1367) Du Guesclin was again a prisoner in English hands, and Henry lost his throne. Fever destroyed the victorious host, and the Black Prince, withdrawing into Gascony, carried with him the seeds of the disorder which shortened his days. Du Guesclin soon got his liberty again; and Charles V., seeing how much his great rival of England was weakened, determined at last on open war. He allied himself with Henry of Trastamare, listened to the grievances of the Aquitanians, summoned the Black Prince to appear and answer the complaints. In 1369 Henry defeated Pedro, took him prisoner, and murdered him in a brawl; thus perished the hopes of the English party in the south. About the same time Charles V. sent open defiance and declaration of war to England. Without delay he surprised the English in the north, recovering all Ponthieu at once; the national pride was aroused; Philip, duke of Burgundy, who had, through the prudent help of Charles, lately won as a bride the heiress of Flanders, was stationed at Rouen, to cover the western approach to Paris, with strict orders not to fight; the Aquitanians were more than half French at heart. The record of the war is as the smoke of a furnace. We see the reek of burnt and plundered towns; there were no brilliant feats of arms; the Black Prince, gloomy and sick, abandoned the struggle, and returned to England to die; the new governor, the earl of Pembroke, did not even succeed in landing: he was attacked and defeated off Rochelle by Henry of Castile, his whole fleet with all its treasure and stores taken or sunk, and he himself was a prisoner in Henry's hands. Du Guesclin had already driven the English out of the west into Brittany; he now overran Poitou, which received him gladly; all the south seemed to be at his feet. The attempt of Edward III. to relieve the little that remained to him in France failed utterly, and by 1372 Poitou was finally lost to England. Charles set himself to reduce Brittany with considerable success; a diversion from Calais caused plentiful misery in the open country; but, as the French again refused to fight, it did nothing to restore the English cause. By 1375 England held nothing in France except Calais, Cherbourg, Bayonne, and Bordeaux. Edward III., utterly worn out with war, agreed to a truce, through intervention of the pope; it was signed in 1375. In 1377, on its expiry, Charles, who in the two years had sedulously improved the state of France, renewed the war. By sea and land the English were utterly overmatched, and by 1378 Charles was master of the situation on all hands. Now, however, he pushed his advantages too far; and the cold skill which had overthrown the English was used in vain against the Bretons, whose duchy he desired to absorb. Languedoc and Flanders also revolted against him. France was heavily burdened with taxes, and the future was dark and threatening. In the midst of these things, death overtook the coldly-calculating monarch in September, 1380.

Du Guesclin.

1380-1390.

Little had France to hope from the boy who was now called on to fill the throne. Charles VI. was not twelve years old, a light-witted, handsome boy, under the guardianship of the royal dukes his uncles, who had no principles except that of their own interest to guide them in bringing up the king and ruling the people. They selfishly quarrelled round his person; the duke of Anjou stole his money and set off to make good his claims on Naples and Sicily; the duke of Burgundy had great prospects in the Low Countries; the duke of Berri ruled in southern France, and was a man of no character or worth; the duke of Bourbon, the late king's brother-in-law, with Burgundy, had charge of the boy's education; Oliver Clisson was made constable of France in the room of Du Guesclin. Before Charles VI. had reached years of discretion he was involved by the French nobles in war against the Flemish cities, which, under guidance of the great Philip van Arteveldt, had overthrown the authority of the count of Flanders. The French cities showed ominous signs of being inclined to ally themselves with the civic movement in the north. The men of Ghent came out to meet their French foes, and at the battle of Roosebek (1382) were utterly defeated and crushed. Philip van Arteveldt himself was slain. It was a great triumph of the nobles over the cities; and Paris felt it when the king returned. All movement there and in the other northern cities of France was ruthlessly repressed; the noble reaction also overthrew the "new men" and the lawyers, by whose means the late king had chiefly governed. Two years later, the royal dukes signed a truce with England, including Ghent in it; and Louis de Mâle, count of Flanders, having perished at the same time, Margaret, his daughter, wife of Philip of Burgundy, succeeded to his inheritance (1384). Thus began the high fortunes of the house of Burgundy, which at one time seemed to overshadow emperor and king of France. In 1385 another of the brothers, Louis, duke of Anjou, died, with all his Italian ambitions unfulfilled. In 1386 Charles VI., under guidance of his uncles, declared war on England, and exhausted all France in preparations; the attempt proved the sorriest failure. The regency of the dukes became daily more unpopular, until in 1388 Charles dismissed his two uncles, the dukes of Burgundy and Berri, and began to rule. For a while all went much better; he recalled his father's friends and advisers, lightened the burdens of the people, allowed the new ministers free hand in making prudent government; and learning how bad had been the state of the south under the duke of Berri, deprived him of that command in 1390. Men thought that the young king, if not good himself, was well content to allow good men to govern in his name; at any rate the rule of the selfish dukes seemed to be over. Their bad influences, however, still surrounded him; an attempt to assassinate Oliver Clissou the constable was connected with their intrigues and those of the duke of Brittany; and in setting forth to punish the attempt on his favorite the constable, the unlucky young king, who had sapped his health by debauchery, suddenly became mad. The dukes of Burgundy and Berri at once seized the reins, and put aside his brother the young duke of Orleans. It was the beginning of that great civil discord between Burgundy and Orleans, the Burgundians and Armagnacs, which worked so much ill for France in the earlier part of the next century. The rule of the uncles was disastrous for France; no good government seemed even possible for that unhappy land. From time to time the unfortunate king had lucid intervals; he seems even to have tried to put a stop to the great schism of the West, that struggle between rival popes, the scandalous quarrel of "Urbanists," followers of Urban VI., elected at Rome (in 1378) in opposition to the French power, and of "Clementines," followers of the Avignon pope, Clement VII. But his lucid intervals were too short and few; and the French court was also too much engaged in the Burgundian and Orleanist contest to care much for the peace of the church. There is no more gloomy period of French history than the coming 50 years. It is the record of party strife of a mean and unscrupulous kind, in which also Paris begins her new rôle of partisan. The struggle in the 15th

Charles VI.

Burgundians and Armagnacs.

Urbanists and Clementines.

1390-1407. century between royalty and aristocracy is an unlovely sight, whether it be watched in England, in Germany, or in France. In France the contest took a peculiar form; the whole country seemed to be arrayed under two hostile banners—that of the house of Burgundy, and that of the duke of Orleans. The house of Burgundy was headed by men of grasp and power, and its party bore the name of Burgundians, little as it expressed the true position; while the duke of Orleans was a mean and foolish person, and his party did not go by his name, but, by some accident, took that of the count of Armagnac, who was father-in-law to the duke of Orleans, and a prince of great name and vigor in the south of France. The duke of Burgundy was Philip the Bold, fourth son of King John of France, to whom his father had granted the duchy on the death of Philip de Rouvres, who had left no heirs, so that his inheritance had escheated to the crown. The duke was therefore uncle to Charles VI., and to his rival in France, Louis, duke of Orleans. By his marriage with Margaret of Flanders, to whom the county of Burgundy had descended by female succession, he reunited the duchy and county, and also became lord of Flanders. Though the county (Franche Comté) carried him to the east of France into the empire, his chief power lay in the north. His connection with Germany led him to espouse the side of the Urbanists against the corrupt Avignon papacy, the policy of the duke made him popular with the cities of the north of France, and specially with Paris,—a popularity in no way impaired by his terrible punishment of Liége, which opposed him in 1408; that policy professed to relieve the cities of their worst burdens, and to give them a position of some independence in the presence of their unhappy sovereign and the corrupt court around him. In his foreign politics the duke had also added much to his strength by supporting the house of Lancaster in its successful attack on Richard II.; the friendship of Henry IV. and Henry V. of England was the result. In resources the house of Burgundy was deemed the richest in the world, and its magnificence on great occasions rivalled all that had been dreamt in fable. Lastly, while the French monarchs were a weary series of diseased or dissolute princes, their Burgundian cousins were all strong men—men of faults enough, no doubt, but not of weak vices.

On the other hand, the duke of Orleans, with his following of nobles, was of the south; all his strength lay beyond the Loire, and his party represented the old aristocracy against the modern princes and the popular instincts of the cities. There is no greater mistake than that of speaking of the Burgundian dukes as the last great leaders of feudalism; the feudalism of the age was far more definitely on the side of the Armagnacs. In his church politics Orleans supported the southern Avignon pope against the Germanic and Italian Urbanists; in his foreign politics he and the court went with the losing Yorkist party in England, Richard II. having in 1396 espoused Isabelle of Valois, eldest daughter of Charles VI. At the beginning the Armagnacs were a mere court and noble party; no general or patriotic feelings seemed to be in question; as, however, time went on, and the house of Burgundy drew closer and closer to that of Lancaster, and when England and Burgundy in the days of Henry V. and Bedford seemed to be subjecting France for ever to the foreigner, then the Armagnac party gradually asserted a far higher position for itself, took up the national cause, and rousing the hitherto unconscious patriotism of the people, swept away the invader and his friends.

Party strife in France.

An obscure strife went on until 1404, when Duke Philip of Burgundy died, leaving his vast inheritance to John the Fearless, the deadly foe of Louis of Orleans. Paris was with him, as with his father before him; the duke entered the capital in 1405, and issued a popular proclamation against the ill-government of the queen-regent and Orleans. Much profession of a desire for better things was made, with small results. So things went on till 1407, when, after the duke of Berri, who tried to play the part of a mediator, had brought the two princes together, the duke of Orleans was foully assassinated by a Burgundian partisan. The duke of Burgundy, though he at first withdrew from Paris, speedily returned, avowed the act, and was received with plaudits by the mob. For a few years the strife continued, obscure and bad; a great league of French princes and nobles was made to stem the success of the Burgundians; and it was about this time that the Armagnac name became common. Paris, however, dominated by the "Cabochians," 1412-1422. the butchers' party, the party of the "marrow-bones and cleavers," and entirely devoted to the Burgundians, enabled John the Fearless to hold his own in France; the king himself seemed favorable to the same party. In 1412 the princes were obliged to come to terms, and the Burgundian triumph seemed complete. In 1413 the wheel went round, and we find the Armagnacs in Paris, rudely sweeping away all the Cabochians with their professions of good civic rule. The duke of Berri was made captain of Paris, and for a while all went against the Burgundians, until in 1414 Duke John was fain to make the first peace of Arras, and to confess himself worsted in the strife. The young dauphin Louis took the nominal lead of the national party, and ruled supreme in Paris in great ease and self-indulgence.

Henry V. of England.

The year before Henry V. had succeeded to the throne of England,—a bright and vigorous young man, eager to be stirring in the world, brave and fearless, with a stern grasp of things beneath all,—a very sheet anchor of firmness and determined character. Almost at the very opening of his reign, the moment he had secured his throne, he began a negotiation with France which boded no good. He offered to marry Catharine, the king's third daughter, and therewith to renew the old treaty of Bretigny, if her dower were Normandy, Maine, and Anjou, not without a good sum of money. The French court, on the other hand, offered him her hand with Aquitaine and the money, an offer rejected instantly; and Henry made ready for a rough wooing in arms. In 1415 he crossed to Harfleur, and while parties still fought in France, after a long and exhausting siege took the place; thence he rode northward for Calais, feeling his army too much reduced to attempt more. The Armagnacs, who had gathered at Rouen, also pushed fast to the north, and having choice of passage over the Somme, Amiens being in their hands, got before King Henry, while he had to make a long round before he could get across that stream. Consequently, when on his way he reached Azincourt, he found the whole chivalry of France arrayed against him in his path. The great battle of Azincourt followed, with frightful ruin and carnage of the French. With a huge crowd of prisoners the young king passed on to Calais, and thence to England. The Armagnacs' party lay buried in the hasty graves of Azincourt; never had there been such slaughter of nobles. Still, for three years they made head against their foes; till in 1418 the duke of Burgundy's friends opened Paris' gates to his soldiers, and for the time the Armagnacs seemed to be completely defeated; only the dauphin Charles made feeble war from Poitiers. Henry V. with a fresh army had already made another descent on the Normandy coast; the dukes of Anjou, Brittany, and Burgundy made several and independent treaties with him; and it seemed as though France had completely fallen in pieces. Henry took Rouen, and although the common peril somewhat silenced the strife of faction, no steps were taken to meet him or check his course; on the contrary, matters were made even more hopeless by the murder of John, duke of Burgundy, in 1419, even as he was kneeling and offering reconciliation at the young dauphin's feet. The young Duke Philip now drew at once towards Henry, whom his father had apparently wished with sincerity to check; Paris, too, was weary of the Armagnac struggle, and desired to welcome Henry of England; the queen of France also went over to the Anglo-Burgundian side. The end of it was that on May 21, 1420, was signed the famous treaty of Troyes, which secured the crown of France to Henry, by the exclusion of the dauphin Charles, whenever poor mad Charles VI. should cease to live. Meanwhile Henry was made regent of France, promising to maintain all rights and privileges of the parliament and nobles, and to crush the dauphin with his Armagnac friends, in token whereof he was at once wedded to Catharine of France, and set forth to quell the opposition of the provinces. By Christmas all France north of the Loire was in English hands. All the lands to the south of the river remained firmly fixed in their allegiance to the dauphin and the Armagnacs, and these began to feel themselves to be the true French party, as opposed to the foreign rule of the English. For barely two years that rule was carried on by Henry V. with inflexible justice, and northern France saw with amazement the presence of a real king and an orderly government. In 1422 King Henry died; a few weeks later Charles VI. died also; and

The treaty of Troyes.

1423-1429. Charles VII.

the face of affairs began to change, although at the first Charles VII. the "Well-served," the lazy, listless prince, seemed to have little heart for the perils and efforts of his position. He was proclaimed king at Mehun in Berri, for the true France for the time lay on that side of the Loire; and the regent Bedford, who took the reins at Paris, was a vigorous and powerful prince, who was not likely to give way to an idle dreamer. At the outset Charles suffered two defeats, at Crevant in 1423 and at Verneuil in 1424, and things seemed to be come to their worst. Yet he was prudent, conciliatory, and willing to wait; and as the English power in France,—that triangle of which the base was the sea line from Harfleur to Calais, and the apex Paris,—was unnatural, and far from being really strong, and as the relations between Bedford and Burgundy might not always be friendly, the man who could wait had many chances in his favor. Before long things began to mend; Charles wedded Mary of Anjou, and won over that great house to the French side; more and more was he regarded as the nation's king; symptoms of a wish for reconciliation with Burgundy appeared; the most vehement Armagnacs were sent away from court. Causes of disagreement also shook the friendship between Burgundy and England.

Feeling the evils of inaction most, Bedford in 1428 decided on a forward movement, and sent the earl of Salisbury to the south. He first secured his position on the north of the Loire, then, crossing that river, laid siege to Orleans, the key to the south, and the last bulwark of the national party. All efforts to vex or dislodge him failed; the attempt early in 1429 to stop the English supplies was completely defeated at Bouvray; from the salt fish captured, the battle has taken the name of "the Day of the Herrings." Dunois, bastard of Orleans, was wounded; the Scots, the king's bodyguard, on whom fell ever the grimmest of the fighting, suffered terribly, and their leader was killed. All went well for Bedford till it suited the duke of Burgundy to withdraw from his side, carrying with him a large part of the fighting power of the besiegers. Things were already looking rather gloomy in the English camp, when a new and unexpected rumor struck all hearts cold with fear. A virgin, an Amazon, had been raised up as a deliverer for France, and would soon be on them, armed with mysterious powers.

The Maid of Orleans.

A young peasant girl, one Jeanne Darc, had been brought up in the village of Domrémy, hard by the Lorraine border. The district, always French in feeling, had lately suffered much from Burgundian raids; and this young damsel, brooding over the treatment of her village and her country, and filled with that strange vision-power which is no rare phenomenon in itself with young girls, came at last to believe with warm and active faith in heavenly appearances and messages, all urging her to deliver France and her king. From faith to action the bridge is short; and ere long the young dreamer of seventeen set forth to work her miracle. Her history is quite unique in the world; and though probably France would ere many years have shaken off the English yoke, for its strength was rapidly going, still to her is the credit of having proved its weakness, and of having asserted the triumphant power of a great belief. All gave way before her; Charles VII., persuaded doubtless by his mother-in-law Yolande of Aragon, who warmly espoused her cause, listened readily to the maiden's voice; and as that voice urged only what was noble and pure, she carried conviction as she went. In the end she received the king's commission to undertake the relief of Orleans. Her coming was fresh blood to the defence; a new spirit seemed to be poured out on all her followers, and in like manner a deep dejection settled down on the English. The blockade was forced, and in eight days the besiegers raised the siege and marched away. They withdrew to Jargeau, where they were attacked and routed with great loss. A little later Talbot himself, who had marched to help them, was also defeated and taken. Then, compelling Charles to come out from his inglorious ease, she carried him triumphantly with her to Rheims, where he was duly crowned king, the Maid of Orleans standing by, and holding aloft the royal standard.

She would gladly have gone home to Domrémy now, her mission being accomplished; for she was entirely free from all ambitious or secondary aims. But she was too great a power to be spared. Northern France was still in English hands, and till the English were cast out her work was not complete; so they made her stay, sweet child, to do the work which, had there been any manliness in them, they ought to have found it easy to achieve for themselves. The dread of her went before her,—a pillar of cloud and darkness to the English, but light and hope to her countrymen. Men believed that she was called of God to regenerate the world, to destroy the Saracen at last, to bring in the millennial age. Her statue was set up in the churches, and crowds prayed before her image as before a popular saint.

1429-1439.

The incapacity and ill-faith of those round the king gave the English some time to recover themselves; Bedford and Burgundy drew together again, and steps were taken to secure Paris. When, however, Jeanne, weary of courtly delays, marched, contemptuous of the king, as far as to St. Denis, friends sprang up on every side. In Normandy, on the English line of communications, four strong places were surprised; and Bedford, made timid as to his supplies, fell back to Rouen, leaving only a small garrison in Paris. Jeanne, ill-supported by the royal troops, failed in her attack on the city walls, and was made prisoner by the Burgundians; they handed her over to the English, and she was, after grievous indignities, and such treatment as chivalry alone could have dealt her, condemned as a witch, and burnt as a relapsed heretic at Rouen in 1431. Betrayed by the French court, sold by the Burgundians, murdered by the English, unrescued by the people of France which she so much loved, Jeanne Darc died the martyr's death, a pious, simple soul, a heroine of the purest metal. She saved her country, for the English power never recovered from the shock. The churchmen who burnt her, the Frenchmen of the unpatriotic party, would have been amazed could they have foreseen that nearly 450 years afterwards, churchmen again would glorify her name as the saint of the church, in opposition to both the religious liberties and the national feelings of her country.

The treaty of Arras.

The war, after having greatly weakened the noblesse, and having caused infinite sufferings to France, now drew toward a close; the duke of Burgundy at last agreed to abandon his English allies, and at a great congress at Arras in 1435 signed a treaty with Charles VII., by which he solemnly came over to the French side. On condition that he should get Auxerre and Macon as well as the towns on and near the river Somme, he was willing to recognize Charles as king of France. His price was high, yet it was worth all that was given; for after all he was of the French blood royal, and not a foreigner. The death of Bedford, which took place about the same time, was almost a more terrible blow to the fortunes of the English. Paris opened her gates to her king in April, 1436; the long war kept on with slight movements now and then for several years. In these same days the council of Basel sat, and declared the supremacy of councils over the papacy; the long evils of schism had brought the pontiff very low. In connection with this council Charles VII. in 1438 held a national council at Bourges, and enacted therein his Pragmatic Sanction, in which the French church repeated the conclusions of the Basel council, and affirmed the liberties of the Gallican Church, in close connection with its allegiance rather to the king than the pope; it also claimed for capitular bodies and monasteries the right of electing their heads, declared the worst of the taxes levied by the papacy on the church illegal, and restrained the right of appeal to Rome. The French Church received the proclamation with gratitude and applause, while the papacy protested, and the dukes of Brittany and Burgundy refused to recognize it or adopt its principles within their dominions. It continued to be the church-law of France till the necessities of Francis I. bartered it away in 1516 for the Bologna concordat.

The Pragmatic Sanction of Bourges.

The next year was marked by the meeting of the States-General, and the establishment, in principle at least, of a standing army. The Estates petitioned the willing king that the system of finance in the realm should be remodelled, and a permanent tax established for the support of an army. Thus, it was thought, solidity would be given to the royal power, and the long-standing curse of the free-booters and brigands cleared away. No sooner was this done than the nobles began to chafe under it; they scented in the air the coming troubles; they took as their head, poor innocents, the young dauphin Louis, who was willing

1439-1453. The Praguerie.

enough to resist the concentration of power in royal hands. Their champion of 1439, the leader of the "Praguerie," as this new league was called, in imitation, it is said, of the Hussite movement at Prague, the enthusiastic defender of noble privilege against the royal power, was the man who afterwards, as Louis XI., was the destroyer of the noblesse on behalf of royalty. Some of the nobles stood firmly by the king, and, aided by them and by an army of paid soldiers serving under the new conditions, Charles VII., no contemptible antagonist when once aroused, attacked and overthrew the Praguerie: the cities and the country people would have none of it; they preferred peace under a king's strong hand. Louis was sent down to the east to govern Dauphiny; the lessons of the civil war were not lost on Charles; he crushed the freebooters of Champagne, drove the English out of Pontoise in 1441, moved actively up and down France, reducing anarchy, restoring order, resisting English attacks. In the last he was loyally supported by the dauphin, who was glad to find a field for his restless temper. He repulsed the English at Dieppe, and put down the count of Armagnac in the south. During the two years' truce with England which now followed, Charles VII. and Louis drew off their free-lances eastward, and the dauphin came into rude collision with the Swiss not far from Basel, in 1444. Some sixteen hundred mountaineers long and heroically withstood at Saint Jacob the attack of several thousand Frenchmen, fighting stubbornly till they all perished. It is said that the experience so dearly bought on the field of Saint Jacob was very useful to Louis in after days, when he was content to leave Charles the Bold to ruin himself by his attacks on Switzerland. The red wine grown on the slope of the graveyard where they fell is called "Schweitzer-blut," Swiss-blood, to this day. It was at this time also that the cardinal of Winchester wedded Henry VI. of England to Margaret of Anjou, the ambitious daughter of King René, the laughter-loving troubadour of Provence, who cared so much for poetry and so little for kingship. The king and dauphin returned to Paris, having defended their border-lands with credit, and having much reduced the numbers of the lawless free-lances. They next set themselves to organize a regular army of fifteen companies of one hundred lances (each lance representing six fighting men), led by fifteen captains appointed by the king, and raised in different districts of France. This army partly absorbed and partly crushed the troublesome free-lances, and became a powerful police, which restored security and made good government once more possible. Round his own person Charles placed those sturdy and faithful fighting men the Scottish guard; under John Stewart d'Aubigné they served the French king well, and at the end of his troubles were placed as a colony at St. Martin d'Auxigny near Bourges, where their descendants still live in the enjoyment of special village-advantages, preserved to them by long use and tradition through all the changes of French history. This army, with the contingent due from the nobles, which was also reduced to order and made to receive pay, raised the power of the French monarchy far above anything that had as yet been seen; and had Charles VII. been more ambitious he might have begun to play the part reserved for his son. The dauphin, discontented again, was obliged once more to withdraw into Dauphiny, where he governed prudently and with activity.

Close of the Hundred Years' War.

In 1449 the last scene of the Anglo-French war began. In that year English adventurers landed on the Breton coast; the duke called the French king to his aid. Charles did not tarry this time; he broke the truce with England, sent Dunois into Normandy, and himself soon followed. In both duchies, Brittany and Normandy, the French were welcomed with delight; no love for England lingered in the west. Somerset and Talbot failed to defend Rouen, and were driven from point to point, till every stronghold was lost to them. Dunois then passed into Guienne, and in a few months Bayonne, the last stronghold of the English, fell into his hands (1451). When Talbot was sent over to Bordeaux with 5000 men to recover the south, the old English feeling revived,—for England was their best customer, and they had little in common with France. It was, however, but a last flicker of the flame; in July, 1453, at the siege of Castillon, the aged Talbot was slain, and the war at once came to an end; the south passed finally into the kingdom of France. Normandy and Guienne were assimilated to France in taxation and army organization; and all that remained to England across the Channel was Calais with Havre and Guines Castle. Her foreign ambitions and struggles over, England was left to consume herself in civil strife, while France might rest and recover from the terrible sufferings she had undergone. The state of the country had become utterly wretched. We are told that from the Loire to the Somme, as fertile a part as any in France, all lay desert, given up to wolves, and traversed only by the robber and the free-lance; the peasant, despairing of his tillage, got him a weapon, and took to the roads; the *danse Macabre*, grimly limned on churchyard walls, was a parable of the age, in which all men lived in the presence of death; mysteries and moralities were the chief literature of the time; Froissart was gone, and Commines had not yet come; the duke of Orleans, so long a prisoner in England, is the one true poet of the time; the "good king René" is but in his earlier days, and gave himself most to poetry in his old age; within the walls of a few towns rose some splendid examples of domestic architecture, like the house of Jacques Cœur, the great merchant at Bourges; the stir and movement of the Renaissance finds little sympathy in France in these dark days.

1453-1461.

State of France.

With the end of the English wars new life began to gleam out on France; the people grew more tranquil, finding that toil and thrift bore again their wholesome fruits; Charles VII. did not fail in his duty, and took his part in restoring quiet, order, and justice in the land. With the return of peace came also the arts of peace; the poet's song is heard. Olivier Basselin, whose verses were afterwards retouched and published by Jean de Houx, belongs to this period; now, too, comes Villon, the first of French poets, whose writings ring still with some of the misery of the past; and Alain Chartier follows a little later.

The French crown, though it had beaten back the English, was still closely girt in with rival neighbors, the great dukes on every frontier. All round the east and north lay the lands of Philip of Burgundy; to the west was the duke of Brittany, cherishing a jealous independence; the royal dukes, Berri, Bourbon, Anjou, are all so many potential sources of danger and difficulty to the crown. The conditions of the nobility are altogether changed; the old barons have sunk into insignificance; the struggle of the future will lie between the king's cousins and himself, rather than with the older lords. A few non-royal princes, such as Armagnac, or St. Pol, or Brittany, remain, and will go down with the others; the "new men" of the day, the bastard Dunois or the constables Du Guesclin and Clisson, grow to greater prominence; it is clear that the old feudalism is giving place to a newer order, in which the aristocracy, from the king's brothers downwards, will group themselves around the throne, and begin the process which reaches its unhappy perfection under Louis XIV.

Directly after the expulsion of the English, troubles began between King Charles VII. and the dauphin Louis; the latter could not brook a quiet life in Dauphiny, and the king refused him that larger sphere in the government of Normandy which he coveted. Against his father's will, Louis married Charlotte of Savoy, daughter of his strongest neighbor in Dauphiny; suspicion and bad feeling grew strong between father and son; Louis was specially afraid of his father's counsellors; the king was specially afraid of his son's craftiness and ambition. It came to an open rupture, and Louis in 1456 fled to the court of Duke Philip of Burgundy. There he lived at refuge at Geneppe, meddling a good deal in Burgundian politics, and already opposing himself to his great rival Charles of Charolais, afterwards Charles the Bold, the last duke of Burgundy. Bickerings, under his bad influence, took place between king and duke; they never burst out into flame. So things went on uncomfortably enough, till Charles VII. died in 1461, and the reign of Louis XI. began.

Contrast of Charles VII. and Louis XI.

Between father and son what contrast could be greater? Charles VII., the "Well-served," so easy-going, so open and free from guile; Louis XI., so shy of counsellors, so energetic and untiring, so close and guileful. History does but apologize for Charles, and even when she fears and dislikes Louis, she cannot forbear to wonder and admire. And yet Louis enslaved his country, while Charles had seen it rescued from foreign rule; Charles restored something of its prosperity, while Louis spent his life in crush-

1461-1465. ing its institutions and in destroying its elements of independence. A great and terrible prince, Louis XI. failed in having little or no constructive power; he was strong to throw down the older society, he built little in its room. It is the fatal evil of absolute monarchy that it is not bound to replace what it crushes; so that the old order passes away, and no new society springs up in its place. It is to this that France owes the barrenness of her constitutional history.

Reign of Louis XI.

The reign of Louis XI. is well divided into three periods. The first six years of it represent his strife with his great lords (1461–1467); the next period, of nine years, is occupied by his rivalry with Charles the Bold (1469–1476); the third, a time of seven years, gives us the king "triumphant and miserable" (1476–1483).

We are so wont to associate the name of Louis XI. with all that is cold, measured, and crafty that we can scarcely believe we are reading his history when we hear the narrative of his first acts on coming to the throne. He appears as a young impulsive prince, whose frank imprudence calculated no cost. He offended the duke of Burgundy's followers who escorted him to his consecration at Rheims, and thence into Paris, by sending them away empty; he deprived the duke of Bourbon of the government of Guienne, which he held; he dismissed all his father's ministers and friends; he set free the noble captives whom his father had been obliged to restrain; he alienated the nobles and clergy by negotiating with the pope and threatening to abolish the Pragmatic Sanction. In all this he seemed inclined to depend on the support of the good towns. Most serious of all was his action with respect to the district of the river Somme, at that time the northern frontier of France. The towns there had been handed over to Philip of Burgundy by the treaty of Arras, with a stipulation that the crown might ransom them at any time, and this Louis succeeded in doing in 1463. The act was quite blameless and patriotic in itself, yet it was exceedingly unwise, for it thoroughly alienated Charles the Bold, and led to the wars of the earlier period of the reign. Lastly, as if he had not done enough to offend the nobles, Louis in 1464 attacked their hunting rights, touching them in their tenderest part. No wonder that this year saw the formation of a great league against him, and the outbreak of a dangerous civil war. The "League of the Public Weal" was nominally headed by his own brother Charles, heir to the throne; it was joined by Charles of Charolais, who had completely taken the command of affairs in the Burgundian territories, his father the old duke being too feeble to withstand him; the dukes of Brittany, Nemours, Bourbon, John of Anjou, duke of Calabria, the count of Armagnac, the aged Dunois, and a host of other princes and nobles flocked in; and the king had scarcely any forces at his back with which to withstand them. His plans for the campaign against the league were admirable, though they were frustrated by the bad faith of his captains, who mostly sympathized with this outbreak of the feudal nobility. Louis himself marched southward to quell the duke of Bourbon and his friends, and returning from that task, only half done for lack of time, he found that Charles of Charolais had passed by Paris, which was faithful to the king, and was coming down southwards intending to join the dukes of Berri and Brittany, who were on their way towards the capital. The hostile armies met at Montleheri on the Orleans road; and after a strange battle minutely described by Commines—a battle in which both sides ran away, and neither ventured at first to claim a victory—the king withdrew to Corbeil, and then marched into Paris (1465). There the armies of the league closed in on him; and after a siege of several weeks, Louis, feeling disaffection all around him, and doubtful how long Paris herself would bear for him the burdens of blockade, signed the peace of Conflans, which, to all appearances, secured the complete victory to the noblesse, "each man carrying off his piece." Instantly the contented princes broke up their half-starved armies and went home, leaving Louis behind to plot and contrive against them, a far wiser man, thanks to the lesson they had taught him. They did not let him wait long for a chance. The treaty of Conflans had given the duchy of Normandy to the king's brother Charles; he speedily quarrelled with his neighbor the duke of Brittany, and Louis came down at once into Normandy, which threw itself into his arms, and the whole work of the league was broken up. The count of Charolais, occupied with revolts at Dinan and Liége, could not interfere, and presently his father the old Duke Philip died (1467), leaving to him the vast lordships of the house of Burgundy. 1467-1472.

Charles the Bold.

And now the "imperial dreamer," Charles the Bold, was brought into immediate rivalry with that royal trickster, the "universal spider," Louis XI. Charles was by far the nobler spirit of the two; his vigor and intelligence, his industry and wish to raise all around him to a higher cultivation, his wise reforms at home, and attempts to render his father's dissolute and careless rule into a well-ordered lordship—all these things marked him out as the leading spirit of the time. He was completely free from those mean faults which marked his antagonist: he could not lie nor cheat; he was not cold and heartless: he despised the immoral life, the loose tales, the disorderly company of the dauphin's sojourn at Geneppe. Unfortunately, in this noble and otherwise harmonious instrument there was that "one little rift," which gradually ruined all: his pride, which was high, would not have been fatal to him; it was his anger, combined with a certain strength of obstinacy, which brought him to ruin. His territories were partly held under France, partly under the empire: the Artois district, which also may be taken to include the Somme towns, the county of Rhetel, the duchy of Bar, the duchy of Burgundy, with Auxerre and Nevers, were feudally in France; the rest of his lands under the empire. He had therefore interests and means of interference on either hand; and, in fact, it is clear that Charles set before himself two quite different lines of policy, according as he looked one way or the other. He looked towards Paris, and seeing the king there growing stronger, desired to curb him by a league of princes; he looked towards the east, and saw there a splendid field for his ambition, in the scattered territories which lay on the edge of the Holy Roman Empire. At first he followed the former line, seeking to weaken his neighbors, and by coalition against the strongest of them to become undoubted master of the rest; this was in the times of his active hostility towards Louis XI.; afterwards he made truce with the king, and turned his arms against the east, attacking first Lorraine, and then Switzerland.

At the time of Duke Philip's death a new league had been formed against Louis, embracing the king of England, Edward IV., the dukes of Burgundy and Brittany, and the kings of Aragon and Castile. Louis strained every nerve, he conciliated Paris, struck hard at disaffected partisans, and in 1468 convoked the States-General at Tours. The three Estates were asked to give an opinion as to the power of the crown to alienate Normandy, the step insisted on by the duke of Burgundy. Their reply was to the effect that the nation forbids the crown to dismember the realm; they supported their opinion by liberal promises of help. Thus fortified by the sympathy of his people, Louis began to break up the coalition. He made terms with the duke of Bourbon and the house of Anjou; his brother Charles was a cipher; the king of England was paralyzed by the antagonism of Warwick; he attacked and reduced Brittany; Burgundy, the most formidable, alone remained to be dealt with. How should he meet him?—by war or by negotiation? His court was divided in opinion; the king decided for himself in favor of the way of negotiation, and came to the astonishing conclusion that he would go and meet the duke and win him over to friendship. He miscalculated both his own powers of persuasion and the force of his antagonist's temper. The interview of Peronne followed; Charles held his visitor as a captive, and in the end compelled him to sign a treaty of peace, on the basis of that of Conflans, which had closed the War of the Public Weal. And as if this were not sufficient humiliation, Charles made the king accompany him on his expedition to punish the men of Liége, who, trusting to the help of Louis, had again revolted (1469). This done, he allowed the degraded monarch to return home to Paris. An assembly of notables at Tours speedily declared the treaty of Peronne null, and the king made some small frontier war on the duke, which was ended by a truce at Amiens in 1471. The truce was spent in preparation for a fresh struggle, which Louis, to whom time was everything, succeeded in deferring from point to point, till the death of his brother Charles, now duke of Guienne, in 1472 broke up the formidable combination. Charles the Bold at once broke truce and made war on the

1472-1483. king, marching into northern France, sacking towns and ravaging the country, till he reached Beauvais. There the despair of the citizens and the bravery of the women saved the town. Charles raised the siege and marched on Rouen, hoping to meet the duke of Brittany; but that prince had his hands full, for Louis had overrun his territories, and had reduced him to terms. The duke of Burgundy saw that the coalition had completely failed; he too made fresh truce with Louis at Senlis (1472), and only deferred, he no doubt thought, the direct attack on his dangerous rival. Henceforth Charles the Bold turned his attention mainly to the east, and Louis gladly saw him go forth to spend his strength on distant ventures; saw the interview at Trèves with the emperor Frederick III., at which the duke's plans were foiled by the suspicions of the Germans and the king's intrigues; saw the long siege of Neusz wearing out his power; bought off the hostility of Edward IV. of England, who had undertaken to march on Paris; saw Charles embark on his Swiss enterprise; saw the subjugation of Lorraine and capture of Nanci (1475), the battle of Granson, the still more fatal defeat of Morat (1476), and lastly the final struggle of Nanci, and the duke's death on the field (January, 1477).

While Duke Charles had thus been running on his fate, Louis XI. had actively attacked the larger nobles of France, and had either reduced them to submission or had destroyed them. By the time of the fall of the house of Burgundy scarcely one great prince was left who could be formidable; even the power of the duke of Brittany was much straitened. The king had, therefore, free hand to make the best profit he could out of the disasters of his Burgundian rival, and the weakness of his heiress, the young duchess Mary. As Duke Charles had left no male heir, the king at once resumed the duchy of Burgundy, as a male fief of the kingdom; he also took possession of Franche Comté at the same time; the king's armies recovered all Picardy, and even entered Flanders. Then Mary of Burgundy, hoping to raise up a barrier against this dangerous neighbor, offered her hand with all her great territories to young Maximilian of Austria, and married him within six months after her father's death. To this wedding is due the rise to real greatness of the house of Austria; it begins the era of the larger politics of modern times.

After a little hesitation Louis determined to continue the struggle against the Burgundian power. He secured Franche Comté, and on his northern frontier retook Arras, that troublesome border city, the "bonny Carlisle" of those days; and advancing to relieve Therouenne, then besieged by Maximilian, fought and lost the battle of Guinegate (1479). The war was languid after this; a truce followed in 1480, and a time of quiet for France. The misconduct of the French cavalry, which had lost the battle of Guinegate, was followed by the abolition of the free-archer army; the cities were ordered to provide money in place of men, and the age of mercenary foreign armies began. In 1480 also, on the death of the old poet-king René, the two important districts of Anjou and Provence fell in to the crown, Margaret of Anjou, René's daughter and heiress, having ceded them to Louis in return for help; and in the end of 1482 the third peace of Arras closed a while the rivalry between France and Burgundy. Charles the dauphin was engaged to marry the little Margaret, Maximilian's daughter, and as her dower she was to bring Franche Comté and sundry places on the border line disputed between the two princes. In these last days Louis XI. shut himself up in gloomy seclusion in his castle of Plessis near Tours, and there he died in 1483. A great king and a terrible, he has left an indelible mark on the history of France, for he was the founder of France in its later form, as an absolute monarchy ruled with little regard to its own true welfare. He had crushed the older feudalism, and substituted autocracy for anarchy; in all ways he did what he could to centralize the administration; he imposed heavy taxes, and enabled his people to bear them; he employed men of middle condition, and cared for commerce and industry; he treated his towns fairly well, travelled much up and down the realm, acted judiciously in retaining the local estates and parliaments. To his rule is due the rise of that official spirit which marks the practical progress of the life of France; there is no lack of intelligence and vigor in his numerous ordinances, which show that his despotism was not unenlightened or selfish. Though not himself a man of learning, he favored the universities, and set up a printing press in the Sorbonne. We may believe that Louis was perfectly sincere when on his death-bed he longed for a few more years to have set the state in order. He had crushed all resistance; he had enlarged the borders of France, till the kingdom took nearly its modern dimensions; he had organized its army and administration. The danger was lest in the hands of a feeble boy these great results should be squandered away, and the old anarchy once more raise its head.

Character and aims of Louis XI.

1483-1494.

For Charles VIII., who now succeeded, was but thirteen years old, a weak boy whom his father had entirely neglected, the training of his son not appearing to be an essential part of his work in life. The young prince had amused himself with romances, but had learnt nothing useful. A head, however, was found for him in the person of his elder sister Anne, whom Louis XI. had married to Peter II., lord of Beaujeu and duke of Bourbon. To her the dying king entrusted the guardianship of his son; and for more than nine years Anne of France was virtual king. For those years all went well. Her prudence and high intelligence overcame her brother's ill-will, and defeated the plots of the nobles, and, almost in spite of Charles, won for him a complete triumph over feudalism. She was, in truth, a very remarkable woman, and history, because she was just and true and successful, has left her on one side, neglected and forgotten. Yet France flourished greatly under her: she solaced the people according to her father's dying wish; she also with vigorous and triumphant hand overcame the rivalry of Maximilian of Austria, and the selfish opposition of the princes. She it was who enabled Henry of Richmond to seize the throne of England, and to give peace to that troubled realm; she it was who defeated the allies at the battle of St. Aubin du Cormier (1488), thereby asserting the power of France against Brittany; she it was who compelled Maximilian, in the treaty of Sablé, to close the struggle, and to leave the French monarchy in peace. Finally, it was she who out-manœuvred Maximilian in his wooing of Anne of Brittany, and secured the great prize, the heiress and her lands, for her brother Charles. In 1491 the marriage took place which led to the eventual absorption (in 1515) of Brittany into the kingdom of France. After this "Madame la Grande," as this noble lady was rightly styled, withdrew from public life, leaving the country in a healthier state than it had been in for ages, leaving also to the young king a splendid army and a well-filled treasury.

Charles VIII.

Anne of France as regent.

With her disappearance from the scene, the controlling hand is lost, and France begins the age of her Italian expeditions, which, while they introduced her into the general arena of modern politics, and formed the platform on which the rivalry between the houses of France and Austria displayed itself, also influenced the home-life of France disastrously, and exhausted resources and energies so much needed for the wholesome development of the country. The Italian wars led to the civil wars, and they, in the end, cleared the ground for the despotism of Louis XIV.

The Italian expeditions begin.

When the house of Anjou came to an end in 1481, and Anjou and Maine fell in to the crown, there fell in also a far less valuable piece of property—the claim of that house, descended from Charles the youngest brother of St. Louis, on the kingdom of Naples and Sicily. There was much to tempt an ambitious prince in the state of Italy. Savoy, which held the passage into the peninsula, was then thoroughly French in sympathy; Milan, under Lodovico Sforza, "il Moro," was in alliance with Charles; Genoa preferred the French to the Aragonese claimants for influence over Italy; the popular feeling in the cities, especially in Florence, was opposed to the despotism of the Medici, and turned to France for deliverance; the misrule of the Spanish kings of Naples had made Naples thoroughly discontented; Venice was, as of old, the friend of France. Tempted by these reasons, in 1494 Charles VIII. set forth for Italy with a splendid host. He displayed before the eyes of Europe the first example of a modern army, in its three well-balanced branches of infantry, cavalry, and artillery. There was nothing in Italy to withstand his onslaught; he swept through the land in triumph; Charles believed himself to be a great conqueror, giving law to admiring subject-lands; he entered Pisa, Florence, Rome itself. Wherever he went, his heedless ignorance, and the gross misconduct of his followers, left behind implacable hostility,

1495-1501. and turned all friendship into bitterness. At last he entered Naples, and seemed to have asserted to the full the French claim to be supreme in Italy, whereas at that very time his position had become completely untenable. A league of Italian states was formed behind his back; Lodovico il Moro, Ferdinand of Naples, the emperor, Pope Alexander VI., Ferdinand and Isabella, who were now welding Spain into a great and united monarchy, all combined against France; and in presence of this formidable confederacy, Charles VIII. had to cut his way home as promptly as he could. At Fornovo, north of the Apennines, he defeated the allies in July, 1495; and by November the main French army had got safely out of Italy. The forces left behind in Naples were worn out by war and pestilence, and the poor remnant of these, too, bringing with them the seeds of horrible contagious diseases, forced their way back to France in 1496. It was the last effort of the king. His health was ruined by debauchery in Italy, repeated in France; and yet towards the end of his reign he not merely introduced Italian arts, but attempted to reform the state, to rule prudently, to solace the poor; wherefore when he died in 1498 the people lamented him greatly, for he had been kindly and affable, brave also on the battle-field; and much is forgiven to a king.

Louis XII. His children died before him, so that Louis of Orleans, his cousin, was nearest heir to the throne, and succeeded as Louis XII. By his accession in 1498 he reunited the fief of Orleans county to the crown; by marrying Anne of Brittany, his predecessor's widow, he secured also the great duchy of Brittany. The dispensation of Pope Alexander VI., which enabled him to put away his wife Jeanne, second daughter of Louis XI., was brought into France by Cæsar Borgia, who gained thereby his title of duke of Valentinois, a large sum of money, a French bride, and promises of support in his great schemes in Italy.

As a younger man Louis XII. had been idle and dissipated; and to the end self-indulgence clung to him, as a Nessus-shirt, eating into his bones. Yet he was kindly and humane to his people, friendly and without revenge or malice, even in the case of those who had done him most mischief. His reign was the reversal of all the principles of Louis XI. That prince had avoided foreign complications, and had sternly repressed his nobles at home: Louis XII. began at once to interfere in foreign politics, and desired to strengthen the great nobles round the throne. The days were good for France, with this cheerful "pater patriæ" ruling over it. He tried to govern with economy and care, and to develop the resources of the country: it is said that one-third of the realm was brought under cultivation in his time. His ministers were men of real ability. George of Amboise, archbishop of Rouen, the chief of them, was a prudent and sagacious ruler, who, however, unfortunately wanted to be pope, and urged the king in the direction of Italian politics, which he would have done much better to have left alone. Louis XII. was lazy and of small intelligence; George of Amboise and Cæsar Borgia with their Italian ambitions easily made him take up a spirited foreign policy which was disastrous at home. Louis XII. had different aims in Italy from those of Charles VIII. His grandfather Louis had married, in 1389, Valentina Visconti, daughter of Gian Galeazzo, duke of Milan; and it had been agreed that if the duke had no male heirs, Milan should pass to the descendants of Valentina. This had now taken place; and Louis XII., as Valentina's grandson, claimed the duchy; he also asserted his rights to the Two Sicilies. Utterly as the last Italian expedition had failed, the French people were not yet weary of the adventure, and preparations for a new war began at once. In 1499 the king crossed the Alps into the Milanese, and carried all before him for a while. The duchy at first accepted him with enthusiasm; but in 1500 it had had enough of the French and recalled Lodovico, who returned in triumph to Milan. The Swiss mercenaries, however, betrayed him at Novara into the hands of Louis XII., who carried him off to France. The triumph of the French in 1500 was also the highest point of the fortunes of their ally Cæsar Borgia, who seemed for a while to be completely successful. In this year Louis made a treaty at Granada, by which he and Ferdinand the Catholic agreed to despoil Frederick of Naples; and in 1501 Louis made a second expedition into Italy. Again all seemed easy at the outset, and he seized the kingdom of Naples without difficulty; falling out, however, with his partner in the bad bargain, Ferdinand the Catholic, he was speedily swept completely out of the peninsula, with terrible loss of honor, men, and wealth. 1504-1514.

It now became necessary to arrange for the future of France. Louis XII. had only a daughter, Claude, and it was proposed that she should be affianced to Charles of Austria, the future statesman and emperor. This scheme formed the basis of the three treaties of Blois (1504). In 1500, by the treaty of Granada, Louis had in fact handed Naples over to Spain; now by the three treaties he alienated his best friends, the Venetians and the papacy, while he in fact also handed Milan over to the Austrian house, together with territories considered to be integral parts of France. The marriage with Charles came to nothing; the good sense of some, the popular feeling in the country, the open expressions of the States-General of Tours in 1506, worked against the marriage, which had no strong advocate except Queen Anne. Claude, on intercession of the Estates, was affianced to Francis of Angoulême, her distant cousin, the heir presumptive to the throne.

In 1507 Louis made war on Venice; and in the following year the famous treaty of Cambrai was signed by George of Amboise and Margaret of Austria. It was an agreement for a partition of the Venetian territories,—one of the most shameless public deeds in history. The pope, the king of Aragon, Maximilian, Louis XII., were each to have a share. The war was pushed on with great vigor: the battle of Agnadello (14th May, 1509) cleared the king's way towards Venice; Louis was received with open arms by the north Italian towns, and pushed forwards to within sight of Venice. The other princes came up on every side; the proud "Queen of the Adriatic" was compelled to shrink within her walls, and wait till time dissolved the league. This was not long. The pope, Julius II., had no wish to hand northern Italy over to France; he had joined in the shameless league of Cambrai because he wanted to wrest the Romagna cities from Venice, and because he hoped entirely to destroy the ancient friendship between Venice and France. Successful in both aims, he now withdrew from the league, made peace with the Venetians, and stood forward as the head of a new Italian combination, with the Swiss for his fighting men. The strife was close and hot between pope and king; Louis XII. lost his chief adviser and friend George of Amboise, the splendid churchman of the age, the French Wolsey; he thought no weapon better than the dangerous one of a council, with claims opposed to those of the papacy; first a national council at Tours, then an attempted general council at Pisa, were called on to resist the papal claims. In reply Julius II. created the Holy League of 1511, with Ferdinand of Aragon, Henry VIII. of England, and the Venetians, as its chief members, against the French. Louis XII. showed vigor; he sent his nephew Gaston of Foix to subdue the Romagna and threaten the Venetian territories. At the battle of Ravenna in 1512, Gaston won a brilliant victory and lost his life. From that moment disaster dogged the footsteps of the French in Italy, and before winter they had been driven completely out of the peninsula; the succession of the Medicean pope, Leo X., to Julius II. seemed to promise the continuance of a policy hostile to France in Italy. Another attempt on northern Italy proved but another failure, although now Louis XII., taught by his mishaps, had secured the alliance of Venice; the disastrous defeat of La Tremoille near Novara (1513) compelled the French once more to withdraw beyond the Alps. In this same year an army under the duke of Longueville, endeavoring to relieve Therouenne, besieged by the English and Maximilian, the emperor-elect, was caught and crushed at Guinegate. A diversion in favor of Louis XII., made by James IV. of Scotland, failed completely; the Scottish king was defeated and slain at Flodden Field. While his northern frontier was thus exposed, Louis found equal danger threatening him on the east; on this side, however, he managed to buy off the Swiss who had attacked the duchy of Burgundy. He was also reconciled with the papacy and the house of Austria. Early in 1514 the death of Anne of Brittany his spouse, a lady of high ambitions, strong artistic tastes, and humane feelings towards her Bretons, but a bad queen for France, cleared the way for changes. Claude, the king's eldest daughter, was now definitely married to Francis of Angoulême, and invested with the duchy of Brittany; and the king himself, still hoping for a male

1515. heir to succeed him, married again, wedding Mary Tudor, the lovely young sister of Henry VIII. This marriage was probably the chief cause of his death, which followed on New Year's Day, 1515. His was, in foreign policy, an inglorious and disastrous reign; at home, a time of comfort and material prosperity. Agriculture flourished, the arts of Italy came in, though (save in architecture) France could claim little artistic glory of her own; the organization of justice and administration was carried out; in letters and learning France still lagged behind her neighbors.

Francis I. The heir to the crown was Francis of Angoulême, great-grandson of that Louis of Orleans who had been assassinated in the bad days of the strife between Burgundians and Armagnacs, in 1407, and great-great-grandson of Charles V. of France. He was still very young, very eager to be king, very full of far-reaching schemes. Few things in history are more striking than the sudden change at this moment, from the rule of middle-aged men or (as men of fifty were then often called) old men, to the rule of youths,—from sagacious, worldly-prudent monarchs to impulsive boys,—from Henry VII. to Henry VIII., from Louis XII. to Francis I., from Ferdinand to Charles. On the whole Francis I. was the least worthy of the three. He was brilliant, "the king of culture," apt scholar in Renaissance art and immorality; brave also and chivalrous, so long as the chivalry involved no self-denial, for he was also thoroughly selfish, and his personal aims and ideals were mean. His reign was to be a reaction from that of Louis XII.; Francis should set the monarchy once more upright, and secure its autocratic development. He reversed his predecessor's home policy, and was hailed with wild delight by the young nobles, who had found Louis XII. too sparing of gifts. Gifts they wanted now, not power; and they preferred a prince who gave while he crushed them to one who prudently forbore to give while he allowed them to retain their strength. The reputation of Francis I. is infinitely beyond his deserts; his reign was a real misfortune for France, and led the way to the terrible waste and mismanagement which mark her history throughout the century. For Francis was an altogether shallow person: he could not read the character of his great antagonist Charles V., nor the meaning of the vast movement which was but now beginning to develop itself out of, and to take the place of, the Renaissance. He wasted all the energies of France on bootless foreign wars: never has any land been so sinned against as France; her vast wealth of resources, her intelligent and thrifty people, her commanding central position, were all as nothing to her rulers in comparison with that most wasteful and disastrous of snares, a spirited foreign policy.

His character and aims.

From the beginning Francis chose his chief officers unwisely: in Antoine du Prat, his new chancellor, he had a violent and lawless adviser; in Charles of Bourbon, his new constable, an untrustworthy commander. Forthwith, he plunged into Italian politics, being determined to make good his claim both to Naples and to Milan; he made most friendly arrangements with the archduke Charles, his future rival, promising to help him in securing, when the time came, the vast inheritances of his two grandfathers, Maximilian the emperor-elect, and Ferdinand of Aragon: never was a less wise agreement entered on. This done, the Italian war began; Francis descended into Italy, and won the brilliant battle of Marignano, in which the French chivalry crushed the Swiss burghers and peasant mercenaries. The French then overran the north of Italy, and, in conjunction with the Venetians, carried all before them. But the triumphs of the sword were speedily wrested from him by the adroitness of the politician; in an interview with Leo X. at Bologna, Francis bartered the liberties of the Gallican Church for shadowy advantages in Italy: the Pragmatic Sanction of Bourges, which now for nearly a century had secured to the Church of France independence in the choice of her chief officers, was replaced by a concordat, whereby the king allowed the papacy once more to drain the wealth of the Church of France, while the pope allowed the king almost autocratic power over it. He was to appoint to all benefices, with exception of a few privileged offices; the pope was no longer to be threatened with general councils, while he should receive again the annates of the church.

The concordat of Francis I.

The years which followed this brilliantly-disastrous opening brought little good to France. In 1516 the death of Ferdinand the Catholic placed Charles on the throne of Spain; in 1519 the death of Maximilian threw open to the young princes the most dazzling prize of human ambition, the headship of the Holy Roman Empire. Francis I., Charles, and Henry VIII. were all candidates for the votes of the seven electors, though the last never seriously entered the lists. The struggle lay between Francis, the brilliant young prince, who seemed to represent the new opinions in literature and art, and Charles of Austria and Spain, who was as yet unknown and despised, and, from his education under the virtuous and scholastic Adrian of Utrecht, was thought likely to represent the older and reactionary opinions of the clergy. After a long and sharp competition, the great prize fell to Charles, henceforth known to history as that great monarch and emperor Charles V.

1516-1529 The struggle for the empire.

The rivalry between the princes could not cease there. Charles, as representative of the house of Burgundy, claimed all that had been lost when Charles the Bold fell; and in 1521 war broke out between him and Francis, the first of a series of struggles between the two rivals. While the king wasted the resources of his country on these wars, his proud and unwise mother, Louise of Savoy, guided by Antoine du Prat, ruled, to the sorrow of all, at home. The war brought no glory with it: on the Flemish frontier a place or two was taken; in Biscay Fontarabia fell before the arms of France; in Italy Francis had to meet a new league of pope and emperor, and his troops were swept completely out of the Milanese. In the midst of all came the defection of that great prince the Constable Bourbon, head of the younger branch of the Bourbon house, the most powerful feudal lord in France. Louise of Savoy had enraged and offended him, or he her; the king slighted him, and in 1523 the constable made a secret treaty with Charles V. and Henry VIII., and, taking flight into Italy, joined the Spaniards under Lannoy. The French, who had again invaded the Milanese, were again driven out in 1524; on the other hand the incursions of the imperialists into Picardy, Provence, and the south-east were all complete failures. Encouraged by the repulse of Bourbon from Marseilles, Francis I. once more crossed the Alps, and overran a great part of the valley of the Po; at the siege of Pavia he was attacked by Pescara and Bourbon, utterly defeated and taken prisoner (24th February, 1525); the broken remnants of the French were swept out of Italy at once, and Francis I. was carried into Spain, a captive at Madrid. His mother, best in adversity, behaved with high pride and spirit; she overawed disaffection, made preparations for resistance, looked out for friends on every side. Had Francis been in truth a hero, he might even as a prisoner have held his own; but he was unable to bear the monotony of confinement, and longed for the pleasures of France. On this mean nature Charles V. easily worked, and made the captive monarch sign the treaty of Madrid (January 14, 1526),—a compact which Francis meant to break as soon as he could, for he knew neither heroism nor good faith. The treaty stipulated that Francis should give up the duchy of Burgundy to Charles, and marry Eleanor of Portugal, Charles's sister; that Francis should also abandon his claims on Flanders, Milan, and Naples, and should place two sons in the emperor's hands as hostages. Following the precedent of Louis XI. in the case of Normandy, he summoned an assembly of nobles and the parliament of Paris to Cognac where they declared the cession of Burgundy to be impossible. He refused to return to Spain, and made alliances wherever he could,—with the pope, with Venice, Milan, and England. The next year saw the ruin of this league in the discomfiture of Clement VII. and the sack of Rome by the German mercenaries under Bourbon, who was killed in the assault. The war went on till 1529, when Francis having lost two armies in it, and gained nothing but loss and harm, was willing for peace; Charles V., alarmed at the progress of the Turks, was not less willing; and in August, 1529, the famous Treaty of Cambrai, "the Ladies' Peace," was agreed to by Margaret of Austria and Louise of Savoy. Though Charles V. gave up all claim on the duchy of Burgundy, he had secured to himself Flanders and Artois, and had entirely cleared French influences out of Italy, which

The rivalry of Charles V. and Francis I.

The battle of Pavia.

The Treaty of Cambrai.

1529-1541. now became firmly fixed under the imperial hand, as a connecting link between his Spanish and his German possessions. Francis lost ground and credit by these successive treaties, conceived in bad faith, and not honestly carried out. His whole policy, throughout, was tortuous and uncertain; he was misled by showy advantages, and not sufficiently sagacious to discern his true interests. He had in fact little grasp of the great movements of his age, and floated to and fro; neither from the enthusiasm of the Reformation, nor from the instinctive loyalty of his subjects, nor even from the threatening power of Charles, could he succeed in creating for himself a consistent and honorable policy. His Italian ambitions proved a fatal hinderance to his reign; in hopes of recovering Milan, for example, he let Charles delude him, and displeased his natural allies. His foreign alliances were insecure; he would not evoke the sympathy and help of his own people.

No sooner had the treaty of Cambrai been effectual in bringing his sons back to France, than Francis began to look out for new pretexts and means for war. Affairs were not unpromising. His mother's death in 1531 left him in possession of a huge fortune, which she had wrung from defenceless France; the powers which were jealous of Austria, the Turk, the English king, the members of the Smalkald league, all looked to Francis as their leader; Clement VII., though his misfortunes had thrown him into the emperor's hands, was not unwilling to treat with France; and in 1533 by the compact of Marseilles the pope broke up the friendship between Francis and Henry VIII., while he married his niece Catherine de' Medici to Henry, the second son of Francis. This compact was a real disaster to France; the promised dowry of Catherine,—certain Italian cities,—was never paid, and the death of Clement VII. in 1534 made the political alliance with the papacy a failure. The influence of Catherine affected and corrupted French history for half a century. Preparations for war went on; Francis made a new scheme for a national army, though in practice he preferred the tyrant's arm, the foreign mercenary. From his day till the Revolution the French army was largely composed of bodies of men tempted out of other countries, chiefly from Switzerland or Germany.

Catherine de' Medici.

While the emperor strove to appease the Protestant princes of Germany by the peace of Kadan (1534), Francis strengthened himself with a definite alliance with Soliman; and when on the death of Francesco Sforza, duke of Milan, who left no heirs, Charles seized the duchy as its over-lord, Francis, after some bootless negotiation, declared war on his great rival (1536). His usual fortunes prevailed so long as he was the attacking party: his forces were soon swept out of Piedmont, and the emperor carried the war over the frontier into Provence. That also failed, and Charles was fain to withdraw after great losses into Italy. The defence of Provence—a defence which took the form of a ruthless destruction of all its resources—had been entrusted to Anne of Montmorency, who henceforward became constable of France and exerted great influence over Francis I. Though these two campaigns, the French in Italy and the imperialist in Provence, had equally failed in 1536, peace did not follow till 1538, when, after the terrible defeat of Ferdinand of Austria by the Turks, Charles was anxious to have free hand in Germany. Under the mediation of Paul III. the agreement of Nice was come to, which included a ten years' truce, and the abandonment by Francis of all his foreign allies and aims. He seemed a while to have fallen completely under the influence of the sagacious emperor. He gave way entirely to the church party of the time, a party headed by gloomy Henry, now dauphin, who never lost the impress of his Spanish captivity, and by the constable Anne of Montmorency; for a time the artistic or Renaissance party, represented by Anne duchess of Étampes and Catherine de' Medici, fell into disfavor. The emperor even ventured to pass through France, on his way from Spain to the Netherlands. All this friendship, however, fell to dust, when it was found that Charles refused to invest the duke of Orleans, the second son of Francis, with the duchy of Milan, and when the emperor's second expedition against the sea-power of the Turks had proved a complete failure, and Charles had returned to Spain with loss of all his fleet and army. Then Francis hesitated no longer, and declared war against him (1541). The shock the emperor had suffered inspirited all his foes; the sultan and the Protestant German princes were all eager for war; the influence of Anne of Montmorency had to give way before that of the house of Guise, that frontier-family, half French, half German, which was destined to play a large part in the troubled history of the coming half-century. Claude, duke of Guise, a veteran of the earliest days of Francis, was vehemently opposed to Charles and the Austro-Spanish power, and ruled in the king's councils. This last war was as mischievous as its predecessors: no great battles were fought; in the frontier affairs the combatants were about equally fortunate; the battle of Cerisolles, won by the French under Enghien (1544), was the only considerable success they had, and even that was almost barren of results, for the danger to northern France was imminent; there a combined invasion had been planned and partly executed by Charles and Henry VIII.; and the country, almost undefended, was at their mercy. The two monarchs, however, distrusted one another; and Charles V., anxious about Germany, sent to Francis proposals for peace from Crespy Couvrant, near Laon, where he had halted his army; Francis, almost in despair, gladly made terms with him. The king gave up his claims on Flanders and Artois, the emperor his on the duchy of Burgundy; the king abandoned his old Neapolitan ambition, and Charles promised one of the princesses of the house of Austria, with Milan as her dower, to the duke of Orleans, second son of Francis. The duke dying next year, this portion of the agreement was not carried out. The peace of Crespy, which ended the wars between the two great rivals, was signed in autumn, 1544, and like the wars which led to it was indecisive and lame. Charles learnt that with all his great power he could not strike a fatal blow at France; France ought to have learnt that she was very weak for foreign conquest, and that her true business was to consolidate and develop her power at home. Henry VIII. deemed himself wronged by this independent action on the part of Charles, who also had his grievances with the English monarch; he stood out till 1546, and then made peace with Francis, with the aim of forming a fresh combination against Charles. In the midst of new projects, and much activity, the marrer of man's plots came on the scene, and carried off in the same year, 1547, the English king and Francis I., leaving Charles V. undisputed arbiter of the affairs of Europe. In this same year he also crushed the Protestant princes at the battle of Mühlberg.

1541-1547. The Guise family.

The peace of Crespy.

Francis reigned long enough to have been able to do much for France, and, following Louis XII., might have been another "father of his country," setting it in the way of true grandeur and prosperity. And something of this he seemed to see. He liked in the great movements of the age to take that middle course which commends itself to France: like France herself he wished to be Catholic and yet to become champion of the Reformed cause; he loved letters and art; he was a brilliant and chivalrous personage, who had the French qualities strongly marked in character and action. His people felt that he, in the main, represented them; they honored and loved him as a part of themselves. They accepted their position as a united nation—united, that is, under a master who offered them no constitutional rights or liberties; it was enough for them that their master was good-natured and kindly; his vices and weaknesses were little blamed, and much followed. History will record that he was mean and selfish, false and licentious, and that, if he knew what was the nobler path for himself and his country, he could not rise to the heroism of following it, when to do so demanded self-denial. History ought also to remember that he was pitted against the ablest statesman of his age, and that he was called on, with insufficient knowledge and strength, to defend the liberties of Europe against an overwhelming power. That he failed to choose the right weapons, that he failed to make the best use of the weapons he did take up—this was the real weakness of his life. His reign filled those years in which Renaissance passed into Reformation—in which the new enthusiasm for art and letters made the way ready for a more grave and solemn enthusiasm in religion, an enthusiasm which in its simpler side aimed at restoring purity of faith and manners, while in its more extreme developments it mixed itself up with bold political theories, or with a condemnation of all that learning and culture could do for human life. Under the direct kingship of God, men believed that all the older usages,

The character of his reign.

1547. restrictions, and political principles of life were out of place. The Anabaptists carried out, in harsh developments, many of the ideas proclaimed half a century before by Savonarola at Florence. Now, in the history of France no principle appears so well established as this, that she ever "subordinated her religious feelings to her political interests." It is almost as generally true that her political interests were ever subordinated to the personal interests of her leaders. Consequently, we shall always expect to find very little movement of public opinion in France, and only a weak influence of religious sentiment on the general current of affairs; we shall also find her appreciation of political interests weak and ill-informed, her desire for self-government at home as dimly felt as her desire for a right policy abroad; and lastly, we shall see that for ages her history is the history of men not of institutions, and that her worst struggles are caused by personal not national questions. It is one of the grand results of the Revolution that it raised France from this vicious moral and mental state, introducing the rule of ideas and opinions, and the general participation of citizens in their own affairs.

Why the Reformation failed in France.

In the reign of Francis I. the court looked not unkindly on the Reformers, more particularly in the earlier years, while the new opinions were mostly those of Luther. Margaret, the king's sister, the duchess of Etampes, his mistress, Renée of France, the daughter of Louis XII., who took Clement Marot as her secretary, and was a declared Protestant,—all these ladies patronized and protected the Reformers. The king himself, regarding them as a people having ideas and some education and enlightenment, was well inclined towards them for a time. Later on, the excesses of the image-breakers, and the tendency of some of them to depreciate carnal learning, entirely alienated him from them. He never had any religious sympathy with them; and though both he and his mother sided in the beginning with the learned world against the monks and "hypocrites," as Louise of Savoy calls them, they never were interested in those theological questions which, though they might seem to them often to degenerate into unmeaning subtleties, still in reality gave to the reforming movement its true strength. The nobles went with the court, and beyond it. About half the great families with more or less earnestness adopted the Reformed opinions, and that more specially in their second or Calvinistic development. With them went a not inconsiderable body of the upper clergy. With these strong elements in its favor, how did the Reformation come to fail in France? It failed, first because the general body of the people took absolutely no interest in the matter; no popular feeling had been aroused; no discontent with either the clergy or the monasteries existed; and the people, uneducated and unused to political controversy or expression, were in fact never called on to form a judgment in the matter. Personal religion, or personal judgment as to theological questions, even in their more practical bearings, was but little known or cared for in France. And this was true not only of the people, but of the nobles and the court. There was, too, a want of that wholesome cathartic effect which the Reformation worked elsewhere; men's lives became no purer, the family relation was not strengthened, and from the moral side the movement was a failure also. Lastly, France has few great cities though many small ones, and her cities had little or no use of independence of thought and opinion. The towns were much divided; the capital, with its preponderating influence, was distinctly hostile to the Reformers. The Champagne towns, specially Meaux, showed themselves favorable to the new opinions; in the rest of France they had little sway; the persistent piety of the hill country of the south-east and south was an entirely independent phenomenon, which seemed to exert very little influence on the rest of France. In the later days of Francis I., the politico-religious movement connected with the name of Calvin, the series of ideas which formed the basis of Latin Protestantism, as distinct from the Germanic movement of the north, spread over a great part of the south and west of France. It was warmly welcomed by the dissidents of Dauphiny, the Cevennes, the Garonne valley; the nobles also adopted it with enthusiasm. It became a disruptive force in France. While Paris and northern France cling to the old opinions, round which a good number of the great families group themselves, Poitou and the western provinces are the home of the new ideas in church and state. They utter opinions which combine reform in religion with aristocratic and republican views in politics. France thus divided falls a prey to civil war.

1547-1552.

Henry II.

Henry II., who succeeded in 1547, "had all the faults of his father, with a weaker mind;" and as strength of mind was not one of the characteristics of Francis I., we may imagine how little firmness there was in the gloomy king who now reigned.

Parties at court.

Party spirit ruled at court. Henry II., with his ancient mistress Diana of Poitiers, was at the head of one party, that of the strict Catholics, and was supported by old Anne of Montmorency, most unlucky of soldiers, most fanatical of Catholics, and by the Guises, who chafed a good deal under the stern rule of the constable. This party had almost extinguished its antagonists; in the struggle of the mistresses, the pious and learned Anne of Étampes had to give place to imperious Diana. Catherine, the queen, was content to bide her time, watching with Italian coolness the game as it went on; of no account beside her rival, and yet quite sure to have her day, and ready to play parties against one another. Meanwhile, she brought to her royal husband ten sickly children, most of whom died young, and three wore the crown. Of the many bad things she did for France, that was perhaps among the worst.

Mary queen of Scots.

On the accession of Henry II. the duchy of Brittany finally lost even nominal independence; he next got the hand of Mary queen of Scots, then but five years old, for the dauphin Francis; she was carried over to France, and being by birth half a Guise, by education and interests of her married life she became entirely French. It was a great triumph for Henry, for the protector Somerset had laid his plans to secure her for young Edward VI.; it was even more a triumph for the Guises, who saw opened out a broad and clear field for their ambition.

At first Henry II. showed no desire for war, and seemed to shrink from rivalry or collision with Charles V. He would not listen to Paul III., who, in his anxiety after the fall of the Protestant power in Germany in 1547, urged him to resist the emperor's triumphant advance; he seemed to show a dread of war, even among his neighbors. After he had won his advantage over Edward VI., he escaped the war which seemed almost inevitable, recovered Boulogne from the English by a money-payment, and smoothed the way for peace between England and Scotland. He took much interest in the religious question, and treated the Calvinists with great severity; he was also occupied by troubles in the south and west of France. Meanwhile a new pope, Julius III., was the weak dependant of the emperor, and there seemed to be no head left for any movement against the universal domination of Charles V. His career from 1547 to 1552 was, to all appearance, a triumphal march of unbroken success. Yet Germany was far from acquiescence; the princes were still discontented and watchful; even Ferdinand of Austria, his brother, was offended by the emperor's anxiety to secure everything, even the imperial crown, for his son Philip; Maurice of Saxony, that great problem of the age, was preparing for a second treachery, or, it may be, for a patriotic effort. These German malcontents now appealed to Henry for help; and at last Henry seemed inclined to come. He had lately made alliance with England, and in 1552 formed a league at Chambord with the German princes; the old connection with the Turk was also talked of. The Germans agreed to allow him to hold (as imperial vicar, not as king of France), the "three bishoprics," Metz, Verdun, and Toul; he also assumed a protectorate over the spiritual princes, those great bishops and electors of the Rhine, whose stake in the empire was so important. The general lines of French foreign politics are all here clearly marked; in this Henry II. is the forerunner of Henry IV. and of Louis XIV.; the imperial politics of Napoleon start from much the same lines; the proclamations of Napoleon III. before the Franco-German war seemed like thin echoes of the same.

Maurice of Saxony.

Early in 1552 Maurice of Saxony struck his great blow at his master in the Tyrol, destroying in an instant all the emperor's plans for the suppression of Lutheran opinions, and the reunion of Germany in a Catholic empire; and while Charles V. fled for his life, Henry II. with a splendid army crossed the frontiers

1552-1558. of Lorraine. Anne of Montmorency, whose opposition to the war had been overborne by the Guises, who warmly desired to see a French predominance in Lorraine, was sent forward to reduce Metz, and quickly got that important city into his hands; Toul and Verdun soon opened their gates, and were secured, in reality if not in name, to France. Eager to undertake a protectorate of the Rhine, Henry II. tried also to lay hands on Strasburg; the citizens, however, resisted, and he had to withdraw; the same fate befell his troops in an attempt on Spires. Still Metz and the line of the Vosges mountains formed a splendid acquisition for France. The French army, leaving strong garrisons in Lorraine, withdrew through Luxemburg and the northern frontier; its remaining exploits were few and mean, for the one gleam of good fortune enjoyed by Anne of Montmorency, who was unwise and arrogant, and a most inefficient commander, soon deserted him. Charles V., as soon as he could gather forces, laid siege to Metz, but, after nearly three months of late autumnal operations, was fain to break up and withdraw, baffled and with loss of half his army, across the Rhine. Though some success attended his arms on the northern frontier, it was of no permanent value: the loss of Metz, and the failure in the attempt to take it, proved to the worn-out emperor that the day of his power and opportunity was past. The conclusions of the diet of Augsburg in 1555 settled for half a century the struggle between Lutheran and Catholic, but settled it in a way not at all to his mind; for it was the safeguard of princely interests against his plans for an imperial unity. Weary of the losing strife, yearning for ease, ordered by his physicians to withdraw from active life, Charles in the course of 1555 and 1556 resigned all his great lordships and titles, leaving Philip his son to succeed him in Italy, the Netherlands, and Spain, and his brother Ferdinand of Austria to wear in his stead the imperial diadem. These great changes sundered a while the interests of Austria from those of Spain.

Charles V. lays down his dignities.

Henry endeavored to take advantage of the check in the fortunes of his antagonists; he sent Anne of Montmorency to support Gaspard Coligny, the admiral of France, in Picardy, and in harmony with Paul IV., instructed Francis, duke of Guise, to enter Italy to oppose the duke of Alva. As of old, the French arms at first carried all before them, and Guise deeming himself heir to the crown of Naples (for he was the eldest great-grandson of René II., titular king of Naples) pushed eagerly forward as far as the Abruzzi. There he was met and outgeneraled by Alva, who drove him back to Rome, whence he was now recalled by urgent summons to France; for the great disaster of St. Quentin had laid Paris itself open to the assault of an enterprising enemy. With the departure of Guise from Italy the age of the Italian expeditions comes to an end. On the northern side of the realm things had gone just as badly. Philibert of Savoy, commanding for Philip with Spanish and English troops, marched into France as far as to the Somme, and laid siege to St. Quentin, which was bravely defended by Admiral Coligny. Anne of Montmorency, coming up to relieve the place, managed his movements so clumsily that he was caught by Count Egmont and the Flemish horse, and with incredibly small loss to the conquerors, was utterly routed (1557). Montmorency himself and a crowd of nobles and soldiers were taken; the slaughter was great. Coligny made a gallant and tenacious stand in the town itself, but at last was overwhelmed, and the place fell. Terrible as these mishaps were to France, Philip II. was not of a temper to push an advantage vigorously; and while his army lingered, Francis of Guise came swiftly back from Italy; and instead of wasting strength in a doubtful attack on the allies in Picardy, by a sudden stroke of genius he assaulted and took Calais (January, 1558), and swept the English finally off the soil of France. This unexpected and brilliant blow cheered and solaced the afflicted country, while it finally secured the ascendency of the house of Guise. The duke's brother, the cardinal of Lorraine, carried all before him in the king's councils; the dauphin, betrothed long before, was now married to Mary of Scots; a secret treaty bound the young queen to bring her kingdom over with her; it was thought that France with Scotland would be at least a match for England joined with Spain. In the same year, 1558, the French advance along the coast, after they had taken Dunkirk and Nieuport, was finally checked by the brilliant genius of Count Egmont, who defeated them at Gravelines.

1559-1560. All now began to wish for peace, especially Montmorency, weary of being a prisoner, and anxious to get back to court, that he might check the fortunes of the Guises; Philip desired it, that he might have free hand against heresy. And so at Cateau Cambresis a peace was made in April, 1559, by which France retained the three bishoprics and Calais, surrendering Thionville, Montmédy, and one or two other frontier towns, while she recovered Ham and St. Quentin; the house of Savoy was reinstated by Philip, as a reward to Philibert for his services, and formed a solid barrier for a time between France and Italy; cross marriages between Spain, France, and Savoy were arranged; and finally the treaty contained secret articles by which the Guises for France and Granvella for the Netherlands agreed to crush heresy with the strong hand. As a sequel to this peace, Henry II. held a great tournament at Paris, at which he was accidentally slain by a Scottish knight in the lists.

Peace of Cateau Cambresis.

The Guises now shot up into unbounded power. The new king, Francis II., was devoted to his young wife, and she was entirely led by her uncles the Guises; so strong they seemed that Philip of Spain was alarmed lest Mary Stuart should also win the English crown, and he allowed the accession of Queen Elizabeth, in consequence of his fears, to pass unchallenged. As yet, parties at court were not marked simply by their theological views; that would follow in time. On the Guise side the cardinal of Lorraine was the cleverest man, the true head, while Francis the duke was the arm; he showed leanings towards the Lutherans. On the other side the head was the dull and obstinate Anne of Montmorency, the constable, an unwavering Catholic, supported by the three Coligny brothers, who all were or became Huguenots. The queen-mother, Catherine, fluctuated uneasily between the parties, and though Catholic herself, or rather not a Protestant, did not hesitate to befriend the Huguenots, if the political arena seemed to need their gallant swords. Their noblest leader was Coligny the admiral; their recognized head was Antony king of Navarre, a man as foolish as fearless. He was heir presumptive to the throne after the Valois boys, and claimed to have charge of the young king. Though the Guises had the lead at first, the Huguenots seemed, from their strong aristocratic connections, to have the fairer prospects before them.

Francis II.

Thirty years of desolate civil strife are before us, and we must set it all down briefly and dryly. The prelude to the troubles was played by the Huguenots, who in 1560, guided by La Renaudie, a Perigord gentleman, formed a plot to carry off the young king; for Francis II. had already treated them with considerable severity, and had dismissed from his councils both the princes of the blood royal and the Constable Montmorency. The plot failed miserably, and La Renaudie lost his life; it only secured more firmly the authority of the Guises. As a counterpoise to their influence, the queen-mother now conferred the vacant chancellorship on one of the wisest men France has ever seen, her Lord Bacon, Michel L'Hôpital, a man of the utmost prudence and moderation, who, had the times been better, might have won constitutional liberties for his country, and appeased her civil strife. As it was, he saved her from the Inquisition; his hand drew the edicts which aimed at enforcing toleration on France; he guided the assembly of notables which gathered at Fontainebleau, and induced them to attempt a compromise which moderate Catholics and Calvinists might accept, and which might lessen the power of the Guises. This assembly was followed by a meeting of the States-General at Orleans, at which the prince of Condé and the king of Navarre were seized by the Guises on a charge of having had to do with La Renaudie's plot. It would have gone hard with them had not the sickly king at this very time fallen ill and died (1560).

The civil wars.

This was a grievous blow to the Guises; they had their hands on their rivals, and would have got rid of them in a few days; they had laid their plans to crush the south, and put down the Huguenots by martial law; the queen-mother was powerless, the middle party behind her was as nothing. Now, as in a moment, all was shattered; Catherine de' Medici rose at once to the command of affairs; the new king, Charles IX., was only ten years old, and her position as regent was assured. The Guises would gladly have ruled with her; but she had no fancy for that; she and Chancellor L'Hôpital were not likely

Charles IX.

1560-1562. to ally themselves with all that was severe and repressive. Still, parties made a kind of armistice for a while; the queen-mother drew towards easy-tempered Antony of Navarre; the Guises retained much of their power; Condé was set free; the extremer measures proposed by the Huguenots, who wished the king of Navarre to seize the regency for himself, were not regarded with any favor. While the Guises had been omnipotent, the discontented parties excluded by them from power and office were held together by the bonds of a common adversity; the change of affairs loosened their friendship. They fell into three groups:—the princes of the blood, with the queen-mother; the constable Anne of Montmorency and his Catholic friends; and thirdly, the Huguenot nobles and cities of the south and west. The princes of the blood, through Antony of Navarre, had close connections with the Huguenots; and when the queen-mother had secured him, she doubtless deemed that she would at least be able to neutralize their influence on affairs. She therefore set herself to secure also the constable and his party, and created a kind of triumvirate (composed of herself, Antony of Navarre, and Anne of Montmorency), with which she hoped to rule the country, and to keep the Guises in check. Here was a splendid field for those intrigues in which she had her being; yet the queen's ultimate aim was a good one, for she really desired the tranquillity of France, and hoped to see Catholics and Huguenots dwelling like brethren side by side. It must not be forgotten that the best part of her policy was inspired by the Chancellor L'Hôpital.

Now it was that Mary Stewart, the queen-dowager, was compelled to leave France for Scotland; her departure clearly marks the fall of the Guises, and it also showed Philip of Spain that it was no longer necessary for him to refuse aid and counsel to the Guises; their claims were no longer formidable to him on the larger sphere of European politics; no longer could Mary Stewart dream of wearing the triple crown of Scotland, France, and England.

The tolerant language of L'Hôpital at the States-General of Orleans in 1561 satisfied neither side. The Huguenots were restless; the Bourbon princes tried to crush the Guises, in return for their own imprisonment the year before; the constable was offended by the encouragement shown to the Huguenots; it was plain that new changes impended. Montmorency began them by going over to the Guises; and the fatal triumvirate of Francis, duke of Guise, Montmorency, and St. André, the marshal, was formed. We find the king of Spain forthwith entering the field of French intrigues and politics, as the support and stay of this triumvirate. Parties take a simpler form at once,—one party of Catholics, and another of Huguenots, with the queen-mother and the moderates left powerless between them. These last, guided still by L'Hôpital, once more convoked the States-General at Pontoise: the nobles and the third estate seemed to side completely with the queen and the moderates; a controversy between Huguenots and Jesuits at Poissy only added to the discontent of the Catholics, who were now joined by foolish Antony king of Navarre. The edict of January, 1562, is the most remarkable of the attempts made by the queen-mother to satisfy the Huguenots; but party-passion was already too strong for it to succeed; civil war had become inevitable. The recall of the duke of Guise from Lorraine by his party made an outbreak certain. The Guises themselves were not without Lutheran sympathies; their border-position between France and Germany, their literary tastes, and relations with German princes, made this natural enough. Still they were Catholics, and Lutheran sympathies were very different from Huguenot politics. The sudden outbreak at Vassy on the borders of Champagne, which marked the entry of the Guises into France proper, and the murder of Huguenots in the granary in which they were holding service,—a massacre condemned by Francis of Guise himself,—mark the opening of the civil wars (1st March, 1562). The period may be divided into four parts:—(1) the wars before the establishment of the League (1562–1570); (2) the period of the St. Bartholomew (1570–1573); (3) the struggle of the new Politique party against the Leaguers (1573–1589); (4) the efforts of Henry IV. to crush the League and reduce the country to peace (1589–1598). The period can also be divided by that series of agreements, or peaces, which break it up into eight wars.

The triumvirate.

Periods of the civil wars.

1. The war of 1562, on the skirts of which Philip of Spain interfered on the one side, and Queen Elizabeth with the Calvinistic German princes on the other, showed at once that the Huguenots were by far the weaker party. The English troops at Havre enabled them at first to command the lower Seine up to Rouen; but the other party, after a long siege which cost poor Antony of Navarre his life, took that place, and relieved Paris of anxiety. The Huguenots had also spread far and wide over the south and west, occupying Orleans; the bridge of Orleans was their point of junction between Poitou and Germany. While the strength of the Catholics lay to the east, in Picardy, and at Paris, the Huguenot power was mostly concentrated in the south and west of France. Condé, who commanded at Orleans, supported by German allies, made an attempt on Paris, but finding the capital too strong for him, turned to the west, intending to join the English troops from Havre. Montmorency, however, caught him at Dreux; and in the battle that ensued the marshal of France, St. André, perished; Condé was captured by the Catholics, Montmorency by the Huguenots. Coligny, the admiral, drew off his defeated troops with great skill, and fell back to beyond the Loire; the duke of Guise remained as sole head of the Catholics. Pushing on his advantage, the duke immediately laid siege to Orleans, and there he fell by the hand of a Huguenot assassin. Both parties had suffered so much that the queen-mother thought she might interpose with terms of peace; the edict of Amboise (March, 1563) closed the war, allowing the Calvinists freedom of worship in the towns they held, and some other scanty privileges. A three years' quiet followed, though all men suspected their neighbors, and the high Catholic party tried hard to make Catharine sacrifice L'Hôpital and take sharp measures with the Huguenots. They on their side were restless and suspicious, and it was felt that another war could not be far off. Intrigues were incessant, all men thinking to make their profit out of the weakness of France. The struggle between Calvinists and Catholics in the Netherlands roused much feeling, though Catherine refused to favor either party. She collected an army of her own; it was rumored that she intended to take the Huguenots by surprise, and annihilate them. In autumn, 1567, their patience gave way, and they raised the standard of revolt, in harmony with the heroic Netherlanders. Condé and the Châtillons beleaguered Paris from the north, and fought the battle of St. Denis, in which the old constable Anne of Montmorency was killed. The Huguenots, however, were defeated and forced to withdraw, Condé marching eastwards to join the German troops now coming up to his aid. No more serious fighting followed; the peace of Longjumeau (March, 1568) closed the second war, leaving matters much as they were. The aristocratic resistance against the Catholic sovereigns, against what is often called "the Catholic Reaction," had proved itself hollow; in Germany and the Netherlands, as well as in France, the Protestant cause seemed to fail; it was not until the religious question became mixed up with questions as to political rights and freedom, as in the Low Countries, that a new spirit of hope began to spring up.

1562-1569

The first war.

The second war.

The peace of Longjumeau gave no security to the Huguenot nobles; they felt that the assassin might catch them any day. An attempt to seize Condé and Coligny failed, and served only to irritate their party; Cardinal Châtillon escaped to England; Jeanne of Navarre and her young son Henry took refuge at La Rochelle; L'Hôpital was dismissed the court. The queen-mother seemed to have thrown off her cloak of moderation, and to be ready to relieve herself of the Huguenots by any means, fair or foul. War accordingly could not fail to break out again before the end of the year. Condé had never been so strong; with his friends in England and the Low Countries, and the enthusiastic support of a great party of nobles and religious adherents at home, his hopes rose; he even talked of deposing the Valois and reigning in their stead. He lost his life, however, early in 1569, at the battle of Jarnac. Coligny once more with difficulty, as at Dreux, saved the broken remnants of the defeated Huguenots. Condé's death, regarded at the time by the Huguenots as an irreparable calamity, proved in the end to be no serious loss; for it made room for the true head of the party, Henry of Navarre. No sooner had Jeanne of Navarre heard of the mishap of Jarnac than she came into the Huguenot

The third war.

1570-1572. camp, and presented to the soldiers her young son Henry and the young prinee of Condé, a mere child. Her gallant bearing and the true soldier-spirit of Coligny, who shone most brightly in adversity, restored their temper; they even won some small advantages. Before long, however, the duke of Anjou, the king's youngest brother, eaught and punished them severely at Moncontour. Both parties thenceforward wore themselves out with desultory warfare. In August, 1570, the peace of St. Germain-en-Laye elosed the third war, and ended the first period.

2. It was the most favorable peaee the Huguenots had won as yet; it secured them, beside previous rights, four strongholds. The Catholics were dissatisfied; they could not sympathize with the queen-mother in her alarm at the growing strength of Philip II., head of the Catholics in Europe; they dreaded the existence and growing influence of a party now beginning to receive a definite name, an honorable nickname, the Politiques. These were that large body of French gentlemen who loved the honor of their eountry rather than their religious party, and who, though Catholies, were yet moderate and tolerant. The day will eome when they will assert themselves as the true patriot party, and, supporting Henry IV., will find out a solution for the vexed questions and the troubles of their times. On the other hand, the Huguenots were frightened by the peaee, and regarded its favorable terms as baits and snares. They withdrew sullenly to La Rochelle; the friendly attitude of Charles IX. alarmed them still more; they were scarcely reassured by seeing him ally himself with the house of Austria, then not friendly with Spain. A pair of marriages now proposed by the court amazed them still more. It was suggested that the duke of Anjou should marry Queen Elizabeth of England, and Henry of Navarre Margaret of Valois, the king's sister. Charles IX. hoped thus to be rid of his brother whom he disliked, and to win powerful support against Spain, by the one mateh, and by the other to bring the eivil wars to a close. The sketeh of a far-reaching resistance to Philip II. was drawn out; so eonvinced of his good faith was the prudent and sagaeious William of Orange, that on the strength of these plans he refused good terms now offered him by Spain. There seems no doubt that whatever the subtle Catherine may have thought and meant, Charles IX. was sineere. Catherine eared more for her favorite son Henry of Anjou than for the king, whom she despised; she took no pleasure in those sehemes for helping the Netherlanders in their revolt, by which Charles hoped to oceupy his Huguenot subjects, while he preserved peace at home. She seems all this while to have wished to see some half dozen Huguenot leaders assassinated; thereby she thought the party would be neutralized. She was far from pleased at the ascendency which Coligny, from the moment the king saw him, exercised in the royal eouncils. The duke of Alençon, the remaining son of Catherine, the brother who did not come to the throne, was deeply interested in the plans for a war in the Netherlands; Anjou, who had withdrawn from the scheme of marriage with Queen Elizabeth, was at this moment a candidate for the throne of Poland; while negotiations respecting it were going on, Margaret of Valois was married to Henry of Navarre,—the worst of wives to a husband none too good. Coligny, who had strongly opposed the eandidature of Anjou for the throne of Poland, was set on by an assassin, employed by the queen-mother and her favorite son, and badly wounded; the Huguenots were in utmost alarm, filling the air with eries and menaces. Charles showed great concern for his friend's recovery, and threatened vengeance on the assassins. What was his astonishment to learn that those assassins were his mother and brother! Catherine worked on his fears, and the plot for the great massacre was eombined in an instant. The very next day after the king's consent was wrung from him, 24th August, 1572, the massacre of St. Bartholomew's day took place. The murder of Coligny was completed; his son-in-law Teligny perished; all the chief Huguenots were slain; the slaughter spread to country towns; the church and the civil power were at one, and the vietims, taken at unawares, could make no resistance. The two Bourbons, Henry and the prince of Condé, were spared; they bought their lives by a sudden conversion to Catholicism. The chief guilt of this great crime lies with Catherine de' Medici; for though it is certain that she did not plan it long before, assassination was a recognized part of her way of dealing with Huguenots; only she was too fine to do it in the coarse and wholesale way of the St. Bartholomew. It is from her that the taste for murder in France chiefly sprang. The Guises may well share with her; they planned and executed the hasty act; they too had long dabbled in murder. The king's share in it was, like himself, weak and impulsive; he was the last to eome in, the first to repent. The evil deed was highly applauded as a master-stroke by pope and Spanish king. Yet it soon beeame elear that the crime was a blunder also. The effects of it, startling for the moment, enabled the middle party to take the lead. The duke of Alençon never approved of the massacre; the moderates throughout France were shocked and outraged; the Huguenots, weakened for a while, were content to unite with the Politiques, and place themselves under their leading; Catherine lost her power of balancing between the parties, for they are now but two,—that of the League, and that of the rest of France. A short war followed, —a revolt of the southern cities rather than a war. They made tenacious and heroic resistanee; a large part of the royal forces sympathized rather with them than with the League; and in July, 1573, the edict of Boulogne granted them even more than they had been promised by the peace of St. Germains.

The Politiques.

The St. Bartholomew.

1572-1576.

The fourth war.

3. We have reaehed the period of the "Wars of the League," as the four later civils wars are often called. The last of the four is alone of any real importance.

The Wars of the League.

Just as the peace of La Rochelle was concluded, the duke of Anjou, having been elected king of Poland, left France; it was not long before troubles began again. The duke of Alençon was vexed by his mother's neglect; as heir presumptive to the erown he thought he deserved better treatment, and sought to give himself consideration by drawing towards the middle party; Catherine seemed to be intriguing for the ruin of that party; nothing was safe while she was moving. The king had never held up his head since the St. Bartholomew; it was seen that he now was dying, and the queen-mother took the opportunity of laying hands on the middle party. She arrested Alençon, Montmorency, and Henry of Navarre, together with some lesser ehiefs; in the midst of it all Charles IX. died (1574) in misery, leaving the ill-omened crown to Henry of Anjou, king of Poland, his next brother, his mother's favorite, the worst of a bad breed. At the same time the fifth civil war broke out, interesting chiefly because it was during its continuance that the famous League was actually formed.

The fifth war.

Henry III., when he heard of his brother's death, was only too eager to slip away like a culprit from Poland, though he showed no alacrity in returning to Franee, and dallied with the pleasures of Italy for months. An attempt to draw him over to the side of the Politiques failed eompletely; he attached himself on the contrary to the Guises, and plunged into the grossest dissipation, while he posed himself before men as a good and zealous Catholie. The Politiques and Huguenots therefore made a eompact in 1575, at Milhaud on the Tarn, and chose the prince of Condé as their head; Henry of Navarre escaped from Paris, threw off his forced Catholicism, and joined them. Against them the strict Catholics seemed powerless; the queen-mother elosed this war with the peace of Chastenoy (May, 1576), with terms unusually favorable for both Politiques and Huguenots: for the latter free worship throughout France, except at Paris; for the chiefs of the former great governments.—for Alençon a large central district, for Condé Picardy, for Henry of Navarre Guienne.

Henry III.

To resist all this the high Catholic party framed the League they had long been meditating; it is said that the cardinal of Lorraine had sketched it years before, at the time of the later sittings of the council of Trent. Lesser compacts had already been made from time to time; now it was proposed to form one great league, towards which all should gravitate. The head of the League was Henry, duke of Guise, the second "Balafré," who had won that title in fighting against the German reiters the year before, when they entered France under Condé. He certainly hoped at this time to succeed to the throne of France, either by deposing the corrupt and feeble Henry III., "as Pippin dealt with Hilderik," or by seizing the throne, when the king's debaucheries should have brought him to the grave. The

The Catholic League.

1576-1584. Catholics of the more advanced type, and specially the Jesuits, now in the first flush of credit and success, supported him warmly. The headquarters of the movement were in Picardy, its first object opposition to the establishment of Condé as governor of that province. The League was also very popular with the common folk, especially in the towns of the north. It soon found that Paris was its natural centre; thence it spread swiftly across the whole of France; it was warmly supported by Philip of Spain. The States-General, convoked at Blois in 1576, could bring no rest to France; opinion was just as much divided there as in the country; and the year 1577 saw another petty war, counted as the sixth, which was closed by the peace of Bergerac, another ineffectual truce, which settled nothing. It was a peace made with the Politiques and Huguenots by the court; it is significant of the new state of affairs that the League openly refused to be bound by it, and continued a harassing, objectless warfare. The duke of Anjou (he had taken that title on his brother Henry's accession to the throne) in 1578 deserted the court party, towards which his mother had drawn him, and made friends with the Calvinists in the Netherlands. The southern provinces named him "Defender of their liberties;" they had hopes he might wed Elizabeth of England; they quite mistook their man. In 1579 "the Gallants' War" broke out; the Leaguers had it all their own way; but Henry III., not too friendly to them, and, urged by his brother Anjou, to whom had been offered sovereignty over the seven United Provinces in 1580, offered the insurgents easy terms, and the treaty of Fleix closed the seventh war. Anjou in the Netherlands could but show his weakness; nothing went well with him; and at last, having utterly wearied out his friends, he fled, after the failure of his attempt to secure Antwerp, into France. There he fell ill of consumption, and died in 1584.

The sixth war.

The seventh war.

This changed at once the complexion of the succession question. Hitherto, though no children seemed likely to be born to him, Henry III. was young and might live long, and his brother was there as his heir. Now, Henry III. was the last prince of the Valois, and Henry of Navarre in hereditary succession was heir presumptive to the throne, unless the Salic law were to be set aside. The fourth son of St. Louis, Robert, count of Clermont, who married Beatrix, heiress of Bourbon, was the founder of the house of Bourbon. Of this family the two elder branches had died out:—John, who had been a central figure in the war of the Public Weal, in 1488; Peter, husband of Anne of France, in 1503; neither of them leaving heirs male. Of the younger branch Francis died in 1525, and the famous Constable Bourbon in 1527. This left as the only representatives of the family the counts of La Marche; of these the elder had died out in 1438, and the junior alone survived in the counts of Vendôme. The head of this branch, Charles, was made duke of Vendôme by Francis I. in 1515; he was father of Antony, duke of Vendôme, who, by marrying the heroic Jeanne of Albret, became king of Navarre, and of Louis, who founded the house of Condé; lastly, Antony was the father of Henry IV. He was therefore a very distant cousin to Henry III.; the houses of Capet, of Alençon, of Orleans, of Angoulême, of Maine, and of Burgundy, as well as the elder Bourbons, had to fall extinct before Henry of Navarre could become heir to the crown. All this, however, had now happened; and the Huguenots greatly rejoiced in the prospect of a Calvinist king. The Politique party showed no ill will towards him; both they and the court party declared that if he would become once more a Catholic they would rally to him; the Guises and the League were naturally all the more firmly set against him; and Henry of Navarre saw that he could not as yet safely endanger his influence with the Huguenots, while his conversion would not disarm the hostility of the League. They had before this put forward as heir to the throne Henry's uncle, the wretched old Cardinal Bourbon, who had all the faults and none of the good qualities of his brother Antony. Under cover of his name the duke of Guise hoped to secure the succession for himself; he also sold himself and his party to Philip of Spain, who was now in fullest expectation of a final triumph over his foes. He had assassinated William the Silent; any day Elizabeth or Henry of Navarre might be found murdered; the domination of Spain over Europe seemed almost secured. The pact of Joinville, signed between Philip, Guise, and Mayenne, gives us the measure of the aims of the high Catholic party. Paris warmly sided with them the new development of the League, the "Sixteen of Paris," one representative for each of the districts of the capital, formed a vigorous organization and called for the king's deposition; they invited Henry, duke of Guise, to Paris. Soon after this Henry III. humbled himself, and signed the treaty of Nemours (1585) with the Leaguers. He hereby became nominal head of the League, and its real slave.

The descent of Henry of Navarre.

1585-1589.

The Sixteen of Paris.

The eighth war, the "War of the Three Henries," that is, of Henry III. and Henry of Guise against Henry of Navarre, now broke out. The pope made his voice heard; Sixtus excommunicated the Bourbons, Henry and Condé, and blessed the Leaguers. For the first time there was some real life in one of these civil wars; for Henry of Navarre rose nobly to the level of his troubles. At first the balance of successes was somewhat in favor of the Leaguers; the political atmosphere grew even more threatening, and terrible things, like lightning-flashes, gleamed out now and again. Such, for example, was the execution of Mary Stewart, queen of Scots, in 1586. It was known that Philip II. was preparing to crush England. Elizabeth did what she could to support Henry of Navarre; he had the good fortune to win the battle of Coutras, in which the duke of Joyeuse, one of the favorites of Henry III., was defeated and killed. The duke of Guise, on the other hand, was too strong for the Germans, who had marched into France to join the Huguenots, and defeated them at Vimory and Auneau, after which he marched in triumph to Paris, in spite of the orders and opposition of the king, who, finding himself powerless, withdrew to Chartres. Once more Henry III. was obliged to accept such terms as the Leaguers chose to impose; and with rage in his heart he signed the "Edict of Union" (1588), in which he named the duke of Guise lieutenant-general of the kingdom, and declared that no heretic could succeed to the throne. Unable to endure the humiliation, Henry III. that same winter assassinated the duke and the cardinal of Guise, and seized many leaders of the League, though he missed the duke of Mayenne. This scandalous murder of the "King of Paris," as the capital fondly called the duke, brought the wretched king no solace nor power. His mother did not live to see the end of her son; she died in this the darkest period of his career, and must have been aware that her cunning and her immoral life had brought nothing but misery to herself and all her race. The power of the League party seemed as great as ever; the duke of Mayenne entered Paris, and declared open war on Henry III., who, after some hesitation, threw himself into the hands of his cousin Henry of Navarre in the spring of 1589. The old Politique party now rallied to the king; the Huguenots were staunch for their old leader; things looked less dark for them since the destruction of the Spanish Armada in the previous summer. The Swiss, aroused by the threats of the duke of Savoy at Geneva, joined the Germans, who once more entered north-eastern France; the Leaguers were unable to make head either against them or against the armies of the two kings; they fell back on Paris, and the allies hemmed them in. The defence of the capital was but languid; the populace missed their idol, the duke of Guise, and the moderate party, never extinguished, recovered strength. All looked as if the royalists would soon reduce the last stronghold of the League, when Henry III. was suddenly slain by the dagger of a fanatical half-witted priest. The king had only time to commend Henry of Navarre to his courtiers as his heir, and to exhort him to become a Catholic, before he closed his eyes, and ended the long roll of his vices and crimes. And thus in crime and shame the house of Valois went down. For a few years the throne remained practically vacant: the heroism of Henry of Navarre, the loss of strength in the Catholic powers, the want of a vigorous head to the League,—these things all sustained the Bourbon in his arduous struggle; the middle party grew in strength daily, and when once Henry had allowed himself to be converted, he became the national sovereign, the national favorite, and the high Catholics fell to the fatal position of an unpatriotic faction depending on the arm of the foreigner.

The eighth war, the "War of the Three Henries."

4. The civil wars were not over, for the heat of party raged as yet unslaked; the Politiques

Henry IV

1589-1590. could not all at once adopt a Huguenot king, the League party had pledged itself to resist the heretic, and Henry at first had little more than the Huguenots at his back. There were also formidable claimants for the throne. Charles II., duke of Lorraine, who had married Claude, younger daughter of Henry II., and who was therefore brother-in-law to Henry IV., set up a vague claim; the king of Spain, Philip II., thought that the Salic law had prevailed long enough in France, and that his own wife, the elder daughter of Henry II., had the best claim to the throne; the Guises, though their head was gone, still hoping for the crown, proclaimed their sham-king the cardinal of Bourbon as Charles X., and intrigued behind the shadow of his name. The duke of Mayenne, their present chief, was the most formidable of Henry's opponents; his party called for a convocation of States-General, which should choose a king to succeed, or to replace, their feeble Charles X. During this struggle the high Catholic party, inspired by Jesuit advice, stood forward as the admirers of constitutional principles; they called on the nation to decide the question as to the succession; their Jesuit friends wrote books on the sovereignty of the people. They summoned up troops from every side; the duke of Lorraine sent his son to resist Henry and support his own claim; the king of Spain sent a body of men; the League-princes brought what force they could. Henry of Navarre at the same moment found himself weakened by the silent withdrawal from his camp of the army of Henry III.; the Politique nobles did not care at first to throw in their lot with the Huguenot chieftain; they offered to confer on Henry the post of commander-in-chief, and to reserve the question as to the succession; they let him know that they recognized his hereditary rights, and were hindered only by his heretical opinions; if he would but be converted, they were his. Henry temporized; his true strength, for the time, lay in his Huguenot followers, rugged and faithful fighting-men, whose belief was the motive-power of their allegiance and of their courage. If he joined the Politiques at their price, the price of declaring himself Catholic, the Huguenots would be offended if not alienated. So he neither absolutely refused nor said yes; and the chief Catholic nobles, in the main, stood aloof, watching the struggle between Huguenot and Leaguer, as it worked out its course.

The claimants for the throne.

Henry, thus weakened, abandoned the siege of Paris, and fell back; with the bulk of his forces he marched into Normandy, so as to be within reach of English succor; a considerable army went into Champagne, to be ready to join any Swiss or German help that might come. These were the great days of the life of Henry of Navarre. After the rough training of his boyhood, when his noble mother was no more, and he had become entangled with the dissolute Valois court, he had taken willing share in their debaucheries, and seemed no better than the rest; after he had secured his throne, he relapsed again into a scandalous life, which dimmed the lustre of his vigorous government. But now he was at his best; in the life of camps, the excitements of the battlefield, in the flashes of genius with which he fought successfully against heavy odds, Henry showed himself a hero, who strove for a great cause—the cause of European freedom—as well as for his own crown.

The duke of Mayenne followed the Huguenots down into the west, and found Henry awaiting him in a strong position at Arques, near Dieppe; here at bay the "Béarnais" inflicted a heavy blow on his assailants; Mayenne fell back into Picardy; the prince of Lorraine drew off altogether; and Henry marched back triumphantly to Paris, ravaged the suburbs, and then withdrew to Tours, where he was recognized as king by the parliament. His campaign of 1589 had been most successful; he had defeated the League in a great battle, thanks to his skilful use of his position at Arques, and the gallantry of his troops, which more than counterbalanced the great disparity in numbers. He had seen dissension break out among his enemies; even the pope, Sixtus V., had shown him some favor, and the Politique nobles were certainly not going against him. Early in 1590 Henry had secured Anjou, Maine, and Normandy, and in March defeated Mayenne in a great pitched battle at Ivry, not far from Dreux. The Leaguers fell back in consternation to Paris. Henry reduced all the country round the capital, and sat down before it for a stubborn siege. The duke of Parma had at that time his hands full in the Low Countries; young prince Maurice was beginning to show his great abilities as a soldier, and had got possession of Breda; all, however, had to be suspended by the Spaniards on that side, rather than let Henry of Navarre take Paris. Parma with great skill relieved the capital without striking a blow, and the campaign of 1590 ended in a failure for Henry. The success of Parma, however, made Frenchmen feel that Henry's was the national cause, and that the League flourished only by interference of the foreigner. Were the king of Navarre but a Catholic, he should be a king of France of whom they might all be proud. This feeling was strengthened by the death of the old Cardinal Bourbon, which re-opened at once the succession question, and compelled Philip of Spain to show his hand. He now claimed the throne for his daughter Elizabeth, as eldest daughter of the eldest daughter of Henry II. All the neighbors of France claimed something; Frenchmen felt that it was either Henry IV. or dismemberment. The "Béarnais" grew in men's minds to be the champion of the Salic law, of the hereditary principle of royalty against feudal weakness, of unity against dismemberment, of the nation against the foreigner.

1590-1598.

The middle party, the Politiques of Europe,—the English, that is, and the Germans,—sent help to Henry, by means of which he was able to hold his own in the north-west and south-west throughout 1591. Late in the year the violence of the Sixteen of Paris drew on them severe punishment from the duke of Mayenne; and consequently the duke ceased to be the recognized head of the League, which now looked entirely to Philip II. and Parma, while Paris ceased to be its headquarters; and more moderate counsels having taken the place of its fierce fanaticism, the capital came under the authority of the lawyers and citizens, instead of the priesthood and the bloodthirsty mob. Henry meanwhile, who was closely beleaguering Rouen, was again outgeneralled by Parma, and had to raise the siege. Parma, following him westwards, was wounded at Caudebec; and though he carried his army triumphantly back to the Netherlands, his career was ended by this trifling wound. He did no more, and died in 1592.

In 1593, Mayenne having sold his own claims to Philip of Spain, the opposition to Henry looked more solid and dangerous than ever; he therefore thought the time was come for the great step which should rally to him all the moderate Catholics. After a decent period of negotiation and conferences, he declared himself convinced, and heard mass at St. Denis. The conversion had immediate effect; it took the heart out of the opposition; city after city came in; the longing for peace was strong in every breast, and the conversion seemed to remove the last obstacle. The Huguenots, little as they liked it, could not oppose the step and hoped to profit by their champion's improved position. Their ablest man, Sully, had even advised Henry to make the plunge. In 1594 Paris opened her gates to Henry, who had been solemnly crowned, just before, at Chartres. He was welcomed with immense enthusiasm, and from that day onwards has ever been the favorite hero of the capital. By 1595 only one foe remained,—the Spanish court. The League was now completely broken up; the parliament of Paris gladly aided the king to expel the Jesuits from France. In November, 1595, Henry declared war against Spain, for anything was better than the existing state of things, in which Philip's hand secretly supported all opposition. The war in 1596 was far from being successful for Henry; he was comforted, however, by receiving at last the papal absolution, which swept away the last scruples of France.

The conversion of Henry IV.

War with Spain.

By rewards and kindliness,—for Henry was always willing to give and had a pleasant word for all,—most of the reluctant nobles, headed by the duke of Mayenne himself, came in in the course of 1596. Still the war pressed very heavily, and early in 1597 the capture of Amiens by the Spaniards alarmed Paris, and roused the king to fresh energies. With help of Sully (who had not yet received the title by which he is known to history) Henry recovered Amiens, and checked the Spanish advance. It was noticed that while the old Leaguers came very heartily to the king's help, the Huguenots hung back in a discontented and suspicious spirit. After the fall of Amiens the war languished; the pope offered to mediate, and Henry had time to breathe. He felt that his old comrades the offended Huguenots had good cause for complaint; and in April, 1598, he issued the famous Edict of Nantes which secured

1598. The Edict of Nantes. their position for nearly a century. They got toleration for their opinions; might worship openly in all places, with the exception of a few towns in which the League had been strong; were qualified to hold office in financial posts and in the law; had a Protestant chamber in the parliaments. The number of Huguenots is said to have been at this time rather over a million in all, though little trust can be put in figures; they were strong in Burgundy, Poitou, Saintonge, Provence, Guyenne, and Dauphiny; in the rest of France there were but few of them.

The treaty of Vervins. Immediately after the publication of the Edict of Nantes the Treaty of Vervins was signed. Though Henry by it broke faith with Queen Elizabeth, he secured an honorable peace for his country, and undisputed kingship for himself. It was the last act of Philip II., the confession that his great schemes were unfulfilled, his policy a failure.

III. The Bourbon Monarchy.

1598 an epoch for France. The year 1598 closes the mediæval history of France; henceforth she takes her part in modern history. The power of the feudal noblesse has passed away; the earlier rivalries between France and Austria take a new character; the centralized absolutist monarchy begins. We are coming to the days of the great ministers,—first Sully, then Richelieu, lastly Colbert, under whose rule France becomes great, almost in spite of her kings. The age now past had little to look back on with pleasure; the utter corruption of the court, reign after reign, the selfish partisanship of the nobles, and the harsh incidence of civil war, incline us to believe the age to have been thoroughly wretched. Yet the condition of the French people was less miserable than it had been; without seeing much prosperity we hear less of famine than in previous or in later ages; for civil wars do not so much exhaust the well-being of a country as might appear. It has been observed that the wars of the Roses did little to check the progress of England; and in like manner the wars of the League do not seem to have deeply afflicted France. These wars, in fact, were all the fighting of lords and princes with their retainers; they were languid and partial; and though their story might be wretched enough, the wretchedness of it chiefly fell on the heads of the belligerents themselves. There is no Jacquerie in this age, as in the 15th and as in the 18th century in France; and in some respects the country made a real advance. In arts she has never been really great, and her age of poetry was not yet come. Ronsard and Du Bartas, great as their reputation was once, do not rise into the first rank of poets, and there are no better names. In political and legal writings, on the other hand, we have the great names of Montaigne and L'Hôpital, of Bodin and Hottmann, of Cujas and Etienne Pasquier. Stephanus and Joseph Scaliger represent classical tastes and chronological investigation. Town-life was but little injured, except in Paris herself, by the wars of the period; and even Paris was not altogether the worse for them, for even Henry III. took an interest in the capital, and tried to develop its resources.

The *Christian Republic*. Whether the *Christian Republic*, that great political romance, was ever laid before the eyes of Henry IV. we shall never know; at all events it represents, in a rather extreme form, the broader politics of modern history, and marks a great change in the relations of states. Many of its ideas were, consciously or not, adopted by the imperialism of our own century; for they favored the national vanity, which sought to impose its principles and wishes on Europe. It represented the resistance of France to the Austro-Spanish power, affirmed the general principle of toleration, endeavored to substitute a court of arbitration in place of war, recognized many different forms of government, and sought to weld all civilized Europe into one harmonious community. That it was a dream the world's history has plentifully proved; that there was in it much to admire, much to strive for, is equally proved by the persistence of many of its ideas, and their agreement with the best parts of the development of Europe in modern times.

Parties at Henry's court. In 1598, on the close of the Spanish war, when Henry IV. was at last fully recognized as king of France on all sides, we find at his court representatives of the two policies which for ages contended for the possession of the great resources of the country. These were the Hispano-Catholic policy, which aimed at uniting French and Spanish interests against the north and west of Europe; and on the other side, the policy of the tolerant party, which desired to make France the leader of the Protestant and liberal part of Europe, which allied itself with the Dutch, with the North German Lutherans, with the English, with the Swedes. It is the glory of Sully, of Richelieu, and of Colbert, that they advanced the greatness of France by following the latter of these lines; whereas Louis XIV. lost power from the moment that he abandoned himself to the Spanish policy. 1598-1600

So at Henry's court we find Maximilian of Bethune, lord of Rosny (he was not made duke of Sully till 1606), who headed the liberal party, the party of economy and good government, opposed to Villeroy, who represented the Spanish party, and seemed to have an equal share in the king's regard. Between these two were Jeannin, a great lawyer, and president of the Paris parliament, who worked with Sully and Sillery, who held a middle course, and was the most trusted diplomatist of his time. Villeroy and the Spanish advisers were strongly supported by the court, especially after the appearance of Mary de' Medici. The court of Spain was only too glad to thwart Henry where it could; the English court, after the accession of James, was too much set on windy schemes and grand impossibilities to afford a counterpoise on the other side. Sully had been made head of the finances in 1597, and had found everything in frightful disorder. His stern temper, severe manners, even his narrow grasp, proved him to be admirably suited for the part he had to play; a more enlightened statesman might have failed where he succeeded. We find in his finance no large views as to economic principles; we only see a rigid determination to stop waste, to punish thieves in high places, to make the taxes yield their full worth to the crown. So far as he occupied himself with general politics, Sully's views were right and liberal; he disliked the Spanish tendencies of the court, and did his best to keep his master clear of them. He could not make the king economical, or reduce the outgoings of the state; on the contrary, he felt himself obliged to make a strong army and plentiful artillery, and to accumulate good store of coin at the arsenal, so as to be ready for any need. In spite of these expenses, he speedily lessened the severity of the taxation; and as good government made tranquillity, and tranquillity plenty, France bore her burdens with increasing willingness and ability. The chief failure of Sully's administration lay in his having done nothing to equalize taxation, by compelling noble land to bear its share with the labor of the peasant. He laid on some new taxes, increased some of the worst of the existing imposts, reduced the amount of the public debt, and encouraged agriculture. Henry, who with all his faults had broader views than his finance minister, also did his best for manufactures; the edicts of the reign are numerous, and for the most part very sensible and helpful. Maximilian of Bethune, duke of Sully.

Though the civil wars were over before 1598, content had not returned to the country. Henry was often ungrateful to his old friends and loyal supporters; and the leaders of the Politique party, who might well think they had secured his throne for him, were especially dissatisfied. Consequently, when war broke out with the duke of Savoy in 1600 over some frontier question, the duke of Biron entered into a great plot with Savoy and Spain, and carried with him a formidable party of nobles. Sully, however, was prepared for all; his artillery and munitions of war were such as had never before been seen; and the duke of Savoy, seeing Montmélian, an impregnable stronghold, as it was deemed, actually taken, sued for peace. He retained Saluzzo, for Henry had no desire to meddle in Italian politics, and ceded to France Bresse and Bugey, Valromey and Gex, so securing French influences up to the very gates of Geneva, and making it certain that the duke of Savoy must never again hope to crush that vigorous republic. Just before the end of this war, his divorce from Margaret of Valois having come from the pope, Henry married Mary de' Medici (1600), then in the prime of her beauty; later on she grew fat and heavy. She was always stiff and obstinate, a prejudiced follower of the old ways, who spent her life first in thwarting, afterwards in obliterating, the traces of the higher schemes and acts of her spouse. The duke of Biron, utterly dissatisfied at the result Biron's plot. Mary de' Medici.

1605-1610. of the Savoyard war, plunged into fresh conspiracy; then Henry IV. felt no more pity for him, but seized and beheaded him; it was believed that the queen herself was mixed up in his plot, which had far-reaching ramifications. By 1605 Henry had reduced all the rest of his recalcitrant nobles, treating them without rancor or revenge if they came in, and setting trusty officers of his own to watch over them.

The state of Europe.

The remainder of the king's life was occupied with two things:—first, the strengthening of the resources of France at home; secondly, the preparations for authoritative intervention in the affairs of Europe, which were now beginning to attract the attention of all. The king was called on to intervene as a mediator between the papacy and Venice in 1606–1607, and decided their quarrel in a way which ought to have roused the gratitude of the papal power. Chiefly through Henry's firmness, a truce for twelve years was signed between Spain and the United Provinces,—for the Spaniards, exhausted by the siege of Ostend, the greatest siege the world had ever seen (1601–1604), and quite unable to cope with the genius of Maurice of Nassau, gladly accepted the peaceful overtures of Olden Barneveldt and the commercial grandees of the towns, who then, as afterwards, were opposed to the democratic and war-loving population of the country, which supported the house of Orange. This truce closed the great struggle of the Low Countries for their independence, and virtually secured it to them. While, however, tranquillity reigned in Holland and Italy, Germany was growing ever more uneasy; in more districts than one the struggle between the communions, deferred not ended by the peace of Augsburg of 1555, had become acute. Not only in the Slavonic lands connected with the house of Austria were there excitement and disturbance, but in the Rhine districts questions had arisen which called out the warm interest of all the three confessions,—the Catholic, Lutheran, and Calvinistic. The death of the duke of Cleves in 1609 brought matters to a head; the Dutch and Spaniards, the elector of Brandenburg, and the emperor, all interfered. Then Henry IV. took up the cause of the Protestant princes, and sent envoys to the Evangelic Union of Halle (January, 1610), and made most vigorous preparations for war, in combination with Maurice of Nassau, who agreed to join him with 20,000 Dutchmen in Cleves. It was arranged that the queen should be regent in the king's absence, and as she had never been solemnly crowned, she delayed Henry's departure till that ceremony had taken place; in the days of waiting the king, fretting to be off, went to visit Sully, who lay ill at the Arsenal, and to feast his eyes once more on the splendid armory and munitions of war collected there. As he went, he was assassinated by Ravaillac, who plunged a knife into his heart. It is said to have been the eighteenth attempt made on his life. All the grand plans for interference in the affairs of Europe, and for the reduction of the house of Austria, fell to the ground at once, and German affairs were left to seethe as they would, until in 1618–1619 they came to a head in the outbreak of the Thirty Years' War. The knife of Ravaillac, whether he was set on by the queen and the Spanish party or not, did their work; it left the Protestants of the north to fight for themselves, relieved the king of Spain of grave anxieties, and plunged France once more into confusion and trouble. Not till the reign of Richelieu had succeeded the administration of Sully did France resume her true direction and lead the resistance to the house of Austria.

Assassination of Henry IV.

Character of Henry IV.

Henry IV. had the great quality of individuality. He stands out fresh and clear as a distinct personage, of high soul, bright temper, original and characteristic speech. All great men leave sayings behind them, and Henry's ring with vigorous good nature and humor. His brilliancy in war was that of a captain; he had not the coolness and combination of a general; his moral character was restless, bad, ungrateful, self-indulgent; he took little trouble to help his subjects to greater comfort, though he ever wished them well. They felt that there was in him something of the lazy kindliness of Louis XII. He chose a grand minister in Sully, and, in spite of some wavering, followed him in the right policy for France. He had the faults of the Bourbons; yet he was their greatest king,—on the whole, their noblest man.

Voltaire sums up the good deeds of his reign in nervous phrases:—

"Justice is reformed, and—far harder task!—the two religions live in peace—to all appearance. Agriculture is encouraged; as Sully said, 'Plough and cow, these are the breasts of France, whereat she sucks; they are the true mines and treasures of Peru.' Commerce and the arts, which Sully cared for less, were still honored; gold and silver stuffs enriched Lyons and France. Henry established manufactures of tapestry; French glass after the Venetian style began to be made. To him alone France owes the silk-worm and the mulberry, in spite of Sully. It was Henry who dug the canal which joins the Seine and the Loire. Under him Paris grew and grew fair; he built the Place Royale, he rebuilt the old bridges. Before his day the St. Germain suburb was not connected with the town, and was improved; he saw to that. He built that fine bridge on which every Frenchman as he passes still looks up with emotion at his statue. St. Germain, Monceaux, Fontainebleau, above all the Louvre, were enlarged, almost rebuilt, by him. He established in his long gallery in the Louvre artists of all kinds, and encouraged them frequently with his presence as well as his presents." 1610-1614.

Finally, he had made France the arbiter of Europe, as was felt at Venice and Amsterdam, and as would have been also felt on the Rhine, had not the Spanish faction, and the undying hatred of the Catholic fanaticism, cut short his life on the very eve of great events.

Louis XIII. and the regency.

The regency in France belonged in theory to the princes of the blood-royal; as, however, Catharine de' Medici had made her a precedent, and as Henry IV. had as good as named his spouse regent, Marie de' Medici seized the office at once She took no vengeance on Sully for his opposition to her in past time, but made friends with him, taking from him all real power and command of the finances, while she left him the charge of the artillery and woods, together with the government of Poitou. The princes of the blood-royal were easily disposed of: Condé was in exile, the prince of Conti a cipher; the count of Soissons she quieted with great gifts. Then she composed a council of regency, which was managed by her favorites Concini and his wife Leonora Galigai. Concini, who purchased the marquisate of Ancre, and was made marshal, though an ambitious and greedy foreigner, did not use his power amiss for a time. When the princes, headed by Condé, opposed him and clamored for the convocation of the States-General, Concini quieted them skilfully, and in 1614 caused the young king's majority to be declared,—for Louis XIII. was then thirteen years old,—and summoned the States-General to meet at Paris. As this was the last time that they were called together before the eve of the Revolution, it may be well to say a word as to the body, its nature and composition. The States-General of France, in which the three orders met from time to time at invitation of the king, was an assembly of clergy, nobles, and "third estate" or commons. The three formed three entirely independent chambers, sitting, debating, and voting separately. Consequently the vote of two orders could always veto the wishes of the third; and as clergy were a class and nobles a caste, and as to a large extent the interests of these bodies were identical, and as, moreover, they both enjoyed a fatal immunity from the burdens of taxation, the chance of legislation or taxation on fair principles was very small indeed. Representing the clerical estate sat the bishops and abbots, together with a certain number of lower clergy: in the noble house sat the holders of noble fiefs; the third estate was represented (except in 1789) chiefly by deputies elected in the towns. These bodies had really no legislative power; and though just before the Revolution the parliament of Paris opened the way to great changes by declaring that taxes could only be legally voted by the States-General, they had, as a fact, very little authority even in this respect; in only a few cases did they sanction taxation or vote subsidies; the royal power found it more convenient, till the bankrupt state of the country under Louis XVI. compelled it to call on the Estates for help, to arrange the taxation as it thought good. The great doctrine of the relation between tax-paying and political power was unknown in France. The true function of the Estates seemed to be limited to expressions of opinion on points submitted to them by the king, and to the laying before him, on their side, grievances which they had brought up in their *cahiers* or "quires," from the country. These grievances they could not remedy: all they could do was solemnly to call the attention of the king to them, who could redress them if he liked. This solemn process was almost the only occasion

The States-General of 1614.

1614-1620. on which the Estates met together. They went to church together at the opening, and then in one chamber were met by the king, who addressed them and dismissed them to their several chambers with the business he chose to entrust to their deliberations; then, once more, at the end of their labors they all met again. At the upper end of the hall a platform was erected for the king and his court, the twelve peers, and the household officers; on the right hand of it sat the clergy, on the left the nobles, in front, at the foot of the hall, the third estate. Each order presented its statement of grievances; the king replied with promises and assurances, which came to very little, and the Estates were then dismissed; and if the court had got the money or the help it sought, very little more was thought about gravamina to be redressed. So little was their practical importance,—so rarely were they convoked, that their composition, method of election or nomination, rules of procedure, rights and legislative competency, were never made clear. It was not in the interests of the monarchy, or indeed of the privileged orders, that the Estates should have any power, or meet very often. This, then, was all that France, before the Revolution, ever had by way of what Englishmen call a parliament. The word parliament in France has always signified only a law court; and the parliament of Paris, the chief law court of the realm, claimed a certain constitutional power, as having the duty of registering the royal edicts. As a rule, it proved itself the obsequious servant of the king's will; from time to time, however, it was stubborn, and, refusing to register, held that the royal edict so unregistered was void of authority. In such cases the king was wont to hold what was curiously styled a "lit de justice," a "bed of justice," or solemn visitation of the parliament, in which he personally attended and compelled the reluctant body to register his edict. These things, for the "generalities" or "Pays d'élection,"—that is, for the chief part of France,—were the sum total of constitutional life and power enjoyed,—a total which, under a strong and determined monarch, or such a minister as Richelieu, meant absolutely nothing at all. In the outlying districts, called the "Pays d'états," more liberties existed; these parts voted their own local taxation, and managed to a great extent their own local affairs; they were, however, a mere fringe round the borders of ancient France,—the estate of Flanders (namely Douai and Lille), Provence, Béarn, Lower Navarre, Bigorre, Foix, Soule, Armagnac, Nébouzan, and Marsan.

Parliament in France.

Pays d'élection.

Pays d'états.

Richelieu appears.

The States-General of 1614 did nothing; they faithfully represented the jealousies and ill-will between the orders, and broke up in confusion. Armand du Plessis of Richelieu, bishop of Luçon, was the orator of the clergy on this occasion, the person charged to lay the grievances of his order before the king. This is the only interesting fact in the history of this meeting of the Estates. In 1615 Louis XIII. married Anne of Austria, who afterwards played a considerable part in the troubles of the Fronde. For two years Marshal Ancre steered his perilous way between the young king, who cared little for him,—his mother's favorite, not his,—the princes of the blood, and the discontented Huguenots. In 1617 the new favorite of Louis, Charles d'Albert, count of Luynes, overthrew and killed him; Leonora Galigai, his wife, was executed as a sorceress; the queen-mother and Richelieu, who was just hoping to secure his foothold at court, both fell,—she withdrew to Blois, he to Luçon; the young king, weak and frivolous, fell into the hands of the noblesse. After a time the nobles were as little pleased with Luynes as they had been with Concini, and rallied round the court of Mary de' Medici at Angers. Richelieu, whose great abilities had already been recognized, was charged by Luynes with the delicate task of attempting a reconciliation between the king and his mother; he succeeded by the treaty of Angers in 1620 in averting civil war. Then Luynes, thinking it well to amuse the king, marched with him into Béarn, where the inhabitants, suddenly bereft (in 1617) of their rights as Protestants, were in open ferment and revolt. Here, as in all the south and west of France, the Huguenots were uneasy and suspicious; the incidents of war in Bohemia, where the Calvinists had but just been crushed, and the political changes in the United Provinces, excited their already high-wrought feelings. They claimed the full benefit of the Edict of Nantes, which seemed to the court to be the establishment of a republic in the heart of the monarchy. In 1621 they held an assembly at their capital, La Rochelle, and made a kind of declaration of independence. They divided their 700 congregations throughout France into eight circles, after the German fashion, thus indicating a tendency towards decentralization, which must be offensive to the court and the general body of French people; they arranged their own levies of men and money, and in fact went far towards the full organization of what they styled "the republic of the Reformed churches of France and Béarn." They named the duke of Bouillon their chief, and made Lesdiguières most plentiful offers. These great nobles, however, refused to join them, and the duke of Rohan with his brother Soubise became the heads of this Huguenot movement. There were in it not a few elements of constitutional life; these Protestants had a far better idea of wholesome government than prevailed elsewhere in France. The noblesse, however, would have nothing to do with them, and their efforts were of little avail. The king, who showed considerable energy, took the command against them, and encouraged his army to treat them with barbarous cruelty, for he was a weak and heartless creature. At the siege of Montauban, however, he failed completely, and had to withdraw discomfited. Soon after this, in the end of 1621, Luynes was taken with camp fever and died. The king, who was weary of him, heard with pleasure the tidings of his death. Round him were now formed two parties,—that of the queen-mother upheld by Richelieu, and that of the prince of Condé. The king, leaning towards the latter, which wished for war, set forth on a second campaign against the Huguenots, and conducted it with the same mischievous cruelty as before. The Huguenots showed nothing but weakness; their chief men submitted, and place after place fell. After this war had lasted about a year, the queen-mother got the upper hand at court, and Condé had to withdraw; by a treaty which recalled the old peaces of the civil wars, the chief part of the Edict of Nantes was confirmed, while the Huguenots were forbidden to hold political meetings or to fortify towns; they retained only La Rochelle and Montauban as strongholds (October, 1623). Richelieu, who in 1622 had received the cardinal's hat in reward of his services in reconciling the king with his mother, was now ready to take charge of and to rule the weak, unstable king, who already appeared to fear and dislike his future master. He entered the council in April, 1624.

1621-1624.

Richelieu begins to rule.

"I venture on nothing without first thinking it out; but once decided, I go straight to my point, overthrow or cut down whatever stands in my way, and finally cover it all up with my cardinal's red robe." Such are the words put into Richelieu's mouth; and whether he said them or not, they represent fairly enough his deliberation, resolution, and cold severity. Nor does the final touch as to the red robe of his clerical office go much beyond the truth; for he made great use of his dignity as a cardinal to cover the intrigues and cruelties on which otherwise he might perhaps have never ventured. In his earlier days he seems to have desired to build up a strong monarchy, absolute, without constitutional checks, on the goodwill of a satisfied and well-governed people. The alliance between despotism and democracy, which our own age has also seen, appeared to be especially adapted for France, where the constitutional life was always so weak. As soon, however, as the despotism was established on a firm footing, the people were forgotten; and Richelieu's administration in the end oppressed them quite as much as it crushed the nobles or kept the church in order.

His policy.

When Richelieu entered the king's council in 1624 he was thirty-nine years old. Born in 1585, he was the youngest son of a noble family of Poitou, springing originally from the village of Richelieu. In that family the elder son, if he chose, took orders, because they could always dispose of the bishopric of Luçon, a kind of family benefice; the younger son became a soldier. As such, Armand du Plessis learnt lessons in warfare, which were very useful to him at a later time; the cardinal's robe did not take the place of the soldier's coat,—it only concealed it. When, however, his brother gave up his preferment at Luçon, Armand at once left the calling of a soldier, was ordained, and succeeded to the bishopric in 1607, at the age of twenty-two. The States-General of 1614 made the young prelate's fortune; he pleased Concini and the queen-mother, acted with consummate skill and pru-

His earlier history.

1624-1626. Periods of his career.

dence through the ten years which followed, was made cardinal in 1622, and member of the council in 1624. His later life may be divided into four periods:—(1) from 1624 to 1626, the time of his first resistance against the Austro-Spanish power and his failure. as shown by the peace of Monzon; (2) from 1626 to 1628, when he punished the Huguenots of La Rochelle for that failure, and laid firmer foundations for his after-success; (3) from 1628 to 1635, the period in which he secured his own and his master's despotism in France, and began to interfere in the affairs of Europe; and lastly (4), from 1635 to 1643, the days of his successful lead in the arena of general politics, and of his triumphant overthrow of his domestic foes; the fruits of this period he left for Mazarin to gather in abroad by his triumphs at the peace of Westphalia; Louis XIV. carried out his principles to their utmost development in domestic policy.

First period of his public career.

1. When he began to rule in 1624, the Austro-Spanish power had already become very strong. The first results of the Thirty Years' War were all in their favor; they held the Palatinate and the course of the Rhine, by which they could communicate with the Spanish Netherlands and intimidate the Dutch; they were also masters of the important Valtelline, that long pass which led from the Milanese territory, at this time in their hands, to their German friends in Bavaria and Tyrol. Richelieu determined to attack them both in Germany and in the Italian Alps,—in Germany by supporting the leadership of Christian IV. of Denmark, though he would have much preferred that of Gustavus Adolphus; in the Alps by allying himself with Charles Emmanuel, duke of Savoy, with Venice, and with the Grison leagues. With hardly any resistance he swept the Spanish and papal troops out of the Valtelline; for Urban VIII. was only half-hearted on the side of Spain, and was to some extent influenced by the true winner of some of Richelieu's greatest triumphs, the crafty Capuchin, Father Joseph.[1] Just, however, as all was going on well, Richelieu was paralyzed by an unlucky outburst of Huguenot independence; affairs in Germany took a bad turn, for Wallenstein now appears on the scene with a new imperial army; the attack of the duke of Savoy on Genoa failed; the French in Piedmont and the Valtelline felt themselves insecure. A temporary peace was made with the Huguenots, and in May, 1626, the treaty of Monzon with Spain closed Richelieu's first attempt to reduce the preponderance of that power. It is perhaps the darkest hour of his career; the treaty was secretly and treacherously agreed on; he left his allies to shift for themselves; he seemed to reverse his whole policy. The truth was that the strength of the Spanish party at home, the ill-success of the Lutherans in Germany, and the weakening effect of Huguenot insurrection made it impossible for him to persevere.

The treaty of Monzon.

Second period of his career.

2. It was clear that he must bridle the Rochelle Protestants before he could advance a step; so doing, he would also make a beginning in his second aim, that of bringing down the noblesse,—for some of the proudest aristocrats of France were Huguenots; then he could coerce the queen-mother and her party, with its Spanish leanings; and after that he would be free to resume his foreign policy. This second period of his public career, therefore, is chiefly occupied with the overthrow of the Huguenot power, which was concentrated at La Rochelle. It was, however, preceded by a great court intrigue, for he was already very obnoxious to the nobles near the throne, and to the princes of the blood. The plot was easily detected and crushed; Marshal Ornano perished in prison; Gaston of Orleans, the king's dissolute younger brother, was compelled to make abject submission; the duke of Vendôme lost his government of Brittany; the duchess of Chevreuse was banished; the queen herself was warned to behave more wisely in the future. The influence of women during this century is almost uniformly baleful; that of Henrietta Maria, sister of Louis XIII. and wife of Charles I., led to the attempt of Buckingham to recover his popularity in England by espousing the Huguenot cause, which was exciting a warm interest in the English people. The Huguenots, irritated by the establishment of Fort Louis as a check on La Rochelle, declared war on France herself; they were secretly encouraged by Anne of Austria and the court party, as well as by the Spaniards, who were delighted to see the cardinal thwarted and France weakened by civil war. They were also openly backed by England, which declared war on France, and sent a strong fleet under Buckingham to succor La Rochelle. But there was in light-headed handsome Buckingham nothing of the soldier; he failed ignominiously, while the cardinal's siege grew daily stricter and more certain of success. After fourteen perilous months of siege, Richelieu entered the town in triumph. With the fall of La Rochelle ends the stubborn resistance of the Huguenots to the monarchy; the siege was a kind of after-blow to the civil wars of the previous century. No very severe penalties were exacted from the town; it was simply rendered powerless. The fall of the place roused a warm patriotic feeling in France; it was regarded as a great defeat of England. Buckingham's assassination had opened the way to peace, which was signed between the courts of England and France in September, 1628.

1628-1631.

Third period of his career.

3. It was full time for Richelieu to interfere elsewhere. The utter collapse of the resistance against the house of Austria in Germany had come. Wallenstein was omnipotent in the north; Christian IV. had been driven back into Denmark; the king of Spain was in league with the duke of Rohan and the discontented Huguenots of Languedoc; affairs in Italy were very threatening; the Spaniards were pressing Casale, the key of the great valley of the Po; on the two sieges, La Rochelle and Casale, which took place at the same time, the fortunes of Europe turned. Richelieu, while he sent his agent Charnacé to North Germany to do what he could to check the Austrian advance and to raise up fresh barriers, set himself to relieve Casale. In January, 1629, he had carried Louis XIII. into Italy, and the Spaniards at once raised the siege of Casale. Thence he returned into Languedoc, where the Protestant rebels were moving; they too were speedily put down; and Richelieu, with Father Joseph, once more posed before Europe as the champion of Catholicism. Urban VIII., who little knew his man, wrote him a letter of warm thanks and congratulations. With the fall of Montauban, the last glimmer of local independence in France died out. Before the end of 1629 Richelieu was called on once more to interfere, and this time more seriously, in Italy; the pope, the duke of Mantua, the republic of Venice, all in alarm appealed to him to save them from Spanish domination. He prevailed on the king to appoint him lieutenant-general, and with a splendid staff and army crossed the mountains into Italy early in 1630. His campaign, which did not include any open warfare against Spain, was thoroughly successful; he reduced all Savoy to submission, in spite of the duke's ill-will. While he was thus making a splendid and theatrical campaign in Italy, he was quietly engaged on far greater things elsewhere; he was busy organizing and encouraging the resistance of northern Europe to the house of Austria. Charnacé with Gustavus Adolphus, and Father Joseph at the Ratisbon Diet, were charged with this duty, and fulfilled it with eminent success. It was in 1630 that Gustavus accepted the friendship and help of France, and early in 1631 signed at Bärenwald a treaty of alliance with that power, which consented to pay him a great subsidy for five years. This treaty, in which Gustavus promised not to coerce peaceful Catholics, was approved even by Urban VIII. At the Ratisbon Diet in June, 1630, Father Joseph had a more delicate task; yet he too succeeded. The jealousies of the German princes neutralized all the advantages of the emperor Ferdinand, and brought about the fall of Wallenstein, who withdrew in haughty disdain to Bohemia; the princes also protested against the attempts of Ferdinand on Italy; and he, wishing above all things to conciliate them, and to get his son Ferdinand named Rex Romanorum, promised to secure the Gonzaga-Nevers duke at Mantua, and to withdraw his troops from the second siege of Casale. The first treaty of Cherasco (April, 1631) brought the Italian war to an end; a second treaty, made by Richelieu with Victor Amadeus, the new duke of Savoy, secured for France Pinerolo, the key of the approaches to Turin. Giulio Mazarini, the pope's agent, made his first public appearance in the negotiations of this Italian war and laid the foundations of his fortunes in France.

Gustavus Adolphus enters in.

The Day of Dupes.

A little before this time Richelieu had passed through the most critical moment of his career; the queen-mother, the reigning queen, Gaston of Orleans, still heir to the throne, the house of Guise, a group

[1] [Du Tremblay (1577-1638), by family, confidant of Richelieu, died on the eve of receiving a cardinal's hat.—AM. ED.]

1632-1638. of generals and officers of the crown, the duke of Bouillon, the count of Soissons, all the favorites and courtiers of Louis XIII., had conspired together to overthrow the cardinal. In the very moment of their apparent success, when the king, as they thought, had entirely given him up, the skilful audacity of Richelieu reversed all their plans. He threw himself on Louis XIII. for support, and the king, glad to be delivered from their hands, gave the cardinal *carte blanche;* the "great storm of the court," the "Day of Dupes," passed by and left him stronger than before. He showed no hesitation in punishing and crippling his foes. The queen-mother was got rid of; she took refuge at Brussels, and her ladies were exiled; Gaston fled to Lorraine, the duke of Guise to Italy; the parliament of Paris, which had favored the plot, was reduced to humble submission. Richelieu was now made duke and peer, with the government of Brittany. The attempts of the emigrant nobles to raise the provinces on the borders were sternly and swiftly put down; the battle of Castelnaudary in Languedoc closed the series of outbreaks. The duke of Montmorency, son of the constable, was taken there, and afterwards executed. After pacifying Languedoc, Richelieu rearranged the governorships of the provinces, removing hostile or suspected governors, and putting his own friends in their places. By the end of 1632 he had crushed all the serious elements of resistance throughout France.

This period coincides with the splendid career and premature death of Gustavus Adolphus. His rapid advance and high aims had alarmed Richelieu; his fall at Lützen was a distinct relief to his ally; it enabled him to step in between the combatants with emphasis, and to shape the latter years of the Thirty Years' War so that they might conduce to the advantage of France. In July, 1632, he had seized the duchy of Lorraine, almost without striking a blow, the duke having taken part with the emigrants against him. He was now prepared to advance thence to the Rhine; he took the Protestant adventurers, Bernard of Saxe-Weimar and others, into his pay. Things worked well for Richelieu: the murder of Wallenstein in 1634, the abandonment of the prince's party by the elector of Saxony (peace of Prague, 1635), the lack of a head for the German Calvinists,—all these things combined to open the way for the last and most brilliant period of Richelieu's career.

Fourth period of his career.

4. Late in 1634 he had renewed his alliances with Sweden and the German Calvinists; he persuaded the Dutch to attack the Spanish Netherlands in May, 1635; he declared war on Spain, and came openly into the field, in which hitherto he had worked only by secret and oblique methods. He had under his command such a force as France had never seen: 132,000 men in four armies seemed likely soon to bring the weary war to an end. One army was to join the Dutch under Frederick Henry of Orange and to march on Brussels, a second to unite with Bernard of Weimar and the Swedes across the Rhine, a third to hold the line of the Vosges and protect Lorraine; the fourth with the duke of Savoy should reduce the Milanese country. The result, however, in no way answered the expectations; the campaigns of 1635 and 1636 were unsuccessful and burdensome; neither glory nor profit followed; the Spaniards and Austrians invaded France on three sides,—in Picardy, across the Pyrenees, and in Burgundy. Nor was 1637 more decisive. Though the invaders had been swept out, no important actions took place, no great results followed. The successes of Bernard of Saxe-Weimar on the Rhine in 1638 first showed that the Austro-Spanish power was checked. In this year the first steps were made towards the peace of Westphalia. The birth of the dauphin Louis also now ruined the court party, and secured to Richelieu a firmer lease of power; if their sickly king were to die, as seemed only too likely, he would continue to guide the fortunes of the state under a regency; the hopes and future of Gaston of Orleans were reduced to nothing. The fall of Breisach at the end of the year, which placed the upper Rhine completely in the hands of Bernard of Saxe-Weimar, though it might not be altogether grateful to Richelieu, who feared the skill and abilities of the ambitious and patriotic German, proved to the world that the Austrian power was worn out. The death of Father Joseph at the same moment caused the cardinal no small embarrassment; his place was taken by the supple Mazarin. The death of Bernard, just as his plans seemed on the point of being realized—just as he thought he had made for himself a principality on the Rhine to check the progress as much of France as of Austria—came very opportunely for Richelieu. 1641-1642. There was now no one engaged in the war who could interfere with his objects; he got possession of the army which had served Bernard so well, the best body of fighting men the war had produced after the Swedes had been exhausted; he also seized on the districts in their hands. In 1641 the count of Soissons went over to the Spaniards and invaded northern France. He fell in battle, and the attempt failed. In Germany and Italy the strength of France was more and more distinctly shown. The last battles of the Thirty Years' War were chiefly won by Frenchmen; the cession of Sedan by the duke of Bouillon, and the capture of Perpignan close to the Spanish border, were "the last present made by Richelieu to France" (Michelet). The one helped to secure her northern, the other her southern frontier. The cardinal's last struggle for supremacy took place now. In 1641 the parliament of Paris was humbled, and its ambition to rival the English parliament rudely destroyed; in 1642 the conspiracy of Cinq Mars gave expression to the old and undying hatred of the court for Richelieu. The plot was detected and unravelled as soon as it was spun, and Cinq Mars with his friend De Thou perished on the scaffold at Lyons. After this, all were prostrate and obedient; the court party was utterly foiled, its chief members dead or exiled; the cardinal's foreign policy was triumphant, and neither Spain nor Austria could do more. But he had no time to enjoy the successes his cold heart and strong hand had won; he fell into the hands of the one enemy whom no subtlety could baffle, and died in December, 1642. Richelieu had an inflexible will, vigorous abilities, and a clear idea of what he desired that France should be; and it is hardly too much to say that he made France what she has continued to be almost to our days. Not till the centre of power in Germany had passed from Austria to Prussia did the old foreign policy of France fail; not till constitutional life had got firm hold on the French people did the republic succeed in reversing the evil principles and consequences of Richelieu's home government. His leading idea was that unity brings strength; and into unity his stern resolves and pitiless severities forced his reluctant country. In the career of Louis XIV. we read the true commentary on his acts and principles; in the corrupt and deadly despotism of the 18th century we read its punishment; even the Revolution, though it scourged the older system with scorpions, could not at once destroy it, or build on surer foundations. When we remember how Richelieu crushed, one after another, those elements of society, which had in them germs of a modern constitutional life, we are tempted to speculate on the splendid career which was possible for France had a wiser statesman ruled her in these critical years. The base subserviency of the church, the humiliation of the lawyers in the parliaments, the loss of noble independence, the overthrow of all healthy civic life, the steady depression of Huguenot opinions, the silence of the States-General, the diminution of local liberties even in the "pays d'états," the assertion of the king's independent right to levy taxes and issue edicts,—all these evils might have been avoided, and the strong life, strong often to turbulence, which lived in these different institutions might have been harmonized, brought into friendly and fruitful action, until an original and characteristic constitutional history had given France that strength and prosperity, that home development of magnificent resources, which would have secured her the undisputed lead and lordship among the nations of Europe. Instead, Richelieu gave her unity and glory. The burdens of France increased enormously; her aggressive power, now that she was concentrated in the hand of a despot, who had unchecked command of the persons and purses of his subjects was immensely increased. If we look into Richelieu's character, we shall discern, side by side with that pride which could rejoice in debasing the noblest and strongest, a vanity which, like a vein of impurer metal, spoilt the ring and clearness of his life. He was always conscious of effects: as an author, a dramatist, or a statesman, he was on the look-out for "situations;" his most striking political successes seemed due as much to the necessity of impressing men by startling novelties as to an honest belief in the justice of his cause or the wholesomeness of his course of action. His extraordinary powers, his life-long devotion to the policy he had drawn out for himself and France, secure him his safe posi

Character of Richelieu.

1642. tion as a great man,—a great man on the lower level,—one whom one fears, perhaps admires, but never loves; because there were in him no really high aims, nor any true love of the people under him, nor any desire to rule them well. Richelieu has been often compared with Wolsey and contrasted with Mazarin. The red robe of the cardinal is common to all three; beyond this the comparison with Wolsey is of little value, for the men were essentially unlike in character and aim. The contrast with Mazarin, who lived with him, studied his policy, and succeeded him, is of more value and interest. It is brilliantly treated by Voltaire in his *Henriade* (vii. 327 *sq.*):—

"Henri, dans ce moment, voit sur des fleurs-de-lis
Deux mortels orgueilleux auprès du trône assis.
Ils tiennent sous leurs pieds tout un peuple à la chaîne;
Tous deux sont revêtus de la pourpre romaine;
Tous deux sont entourés de gardes, de soldats;
Il les prend pour des rois. . . . Vous ne vous trompez pas;
Ils le sont, dit Louis, sans en avoir le titre;
Du prince et de l'état l'un et l'autre est l'arbitre.
Richelieu, Mazarin, ministres immortels,
Jusqu'au trône élevés de l'ombre des autels,
Enfants de la fortune et de la politique,
Marcheront à grands pas au pouvoir despotique.
Richelieu, grand, sublime, implacable ennemi:
Mazarin, souple, adroit, et dangereux ami;
L'un fuyant avec art, et cédant à l'orage,
L'autre aux flots irrités opposant son courage;
Des princes de mon sang ennemis déclarés;
Tous deux haïs du peuple, et tous deux admirés;
Enfin, par leurs efforts, ou par leur industrie,
Utiles à leurs rois, cruels à la patrie."

One thing they had in common, the love and encouragement of letters; yet even this in Richelieu's hands must be organized, despotic. Still, he and Mazarin have an honorable claim to remembrance when we speak of the writers of the "great age," for it was under them in the first half or so of the century, rather than under Louis XIV. in the latter half, that the chief masterpieces were produced. The tendency of the reign of Louis XIV. was rather to depress than to ennoble literature. Richelieu founded the French Academy in 1635, and set on foot the *Gazette of France;* he established the royal printing press; he desired to patronize learned men, though his own literary efforts failed, and men of real independence of character, like Corneille and Descartes, shunned the fatal honors of his patronage. He was in all his tastes a great and showy prince; his bearing and surroundings were more than noble; he called to his side artists of every kind; art, in its 17th century decadence and formalism, was well content to do his bidding, and gild an age of splendor without genius.

The rise of Mazarin.

Louis XIII. died within six months after Richelieu's death; he did but give time to Mazarin to win the favor of the queen and to secure his position as first minister. Mazarin was destined to fail completely in home government, while in foreign affairs he brought all his great master's policy to a splendid and successful end. At home his rule reversed Richelieu's stern principle of repression. The subtle and flexible Italian, after the manner of his countrymen, hoped to succeed by counterpoises, by playing factions off against one another, by trading on the meaner side of human nature, by love affairs and jealousies, and all the stock in trade of weak intriguing characters. His rule is characterized by the burlesque wars of the Fronde, which sufficiently showed his want of firmness and the degradation of the age.

Louis XIV.

Louis XIII. left at his death two sons, Louis the dauphin, now Louis XIV., and Philip duke of Anjou, afterwards duke of Orleans, who founded the Orleans branch of the Bourbon family, which ceased to reign on the deposition of Louis Philippe in 1848. The regency was in the hands of Anne of Austria, his queen; Gaston of Orleans was named lieutenant-general of the kingdom; the direction of the government was placed with a council, the prince of Condé, Mazarin, Seguier the chancellor, and two more. The king's will, however, was little respected. Anne, a haughty and ambitious woman, with Mazarin to back her, was not likely to care much for the clog of a council of regency. The parliament of Paris, flattered at appearing to be the arbiter of the counsels of kings, set aside the will, and declared Anne independent regent. The old court party, of which Anne had always been the head, expected to rule at will; Mazarin was tolerated only because he was necessary to bring foreign affairs to a successful issue; that done he would have to go. The "Importants," as they were nicknamed, a frivolous and unworthy company of noble nobodies, reckoned on a long lease of power; the king was little more than a babe,—he was but four years and a half old,—and it would be strange if they could not secure themselves. The war on the frontiers, however, ruthlessly destroyed their hopes. The Spaniards, cheered by the deaths of Richelieu and Louis XIII., had besieged the little frontier-town of Rocroi; Mazarin hastily sent up an army to relieve the place, commanded by Marshal L'Hôpital and the young duke of Enghien, eldest son of Henry I., prince of Condé, a distant cousin of the king. In spite of L'Hôpital's prudent counsels, Enghien recklessly with the confidence of genius and youthful inexperience attacked and utterly defeated the world-famous Spanish infantry, and killed their aged general Fuentes. The battle of Rocroi (1643) destroyed for ever the older fighting-power of the world, the solid Spanish foot, and gave to France her first taste of that military glory which marks the reign; it was the *baptême de feu* of the child-king of France; it also secured the dominance of Mazarin. The house of Condé was his friend; Rocroi enabled him to hold up his head against both Spain and the "Importants;" their party, for the time, was utterly broken up. In these closing years of the Thirty Years' War two able soldiers came to the front, the Great Condé and Turenne,—the one all fire and dash, alike dangerous to friend and foe, the other the greatest tactician of the age. The one represents at its best the old noble fighter, the other the modern skilful officer. In 1644 they drove the imperial general Mercy out of his position at Freiberg, and became masters of the middle Rhine-land; in 1645, pressing the Austrians nearer home, they fought and won the sanguinary second battle of Nördlingen; so much were they weakened by that Cadmean victory that they were unable to keep the advantage, and were thrust back to the Rhine. In 1646 they directed their attention against the elector of Bavaria, in hopes of being able to detach him from Austria; Turenne took undisputed possession of the whole upper Danube valley, and threatened the elector Maximilian at Munich. In 1647 he, to free himself from the invader, who mercilessly ravaged and plundered his lands, signed a separate truce with France, and abandoned at last the imperial cause. Well might the house of Austria now feel that by any sacrifices it must bring the long war to an end. When the elector broke truce early next year, his resistance was crushed by the French at Zusmarshausen, and the fighting in Germany was over. The war had rather more life in it as between France and Spain. In Italy, Flanders, and Catalonia considerable movements went on; that in Flanders, where Condé commanded, was alone decisive; the battle of Lens (9th August, 1648), the last of the fighting on that side, was a crushing and final defeat of the Spanish, and even more fatal to their power than the overthrow of Rocroi.

1642–1648. The "Importants."

Regency of Anne of Austria.

Condé and Turenne.

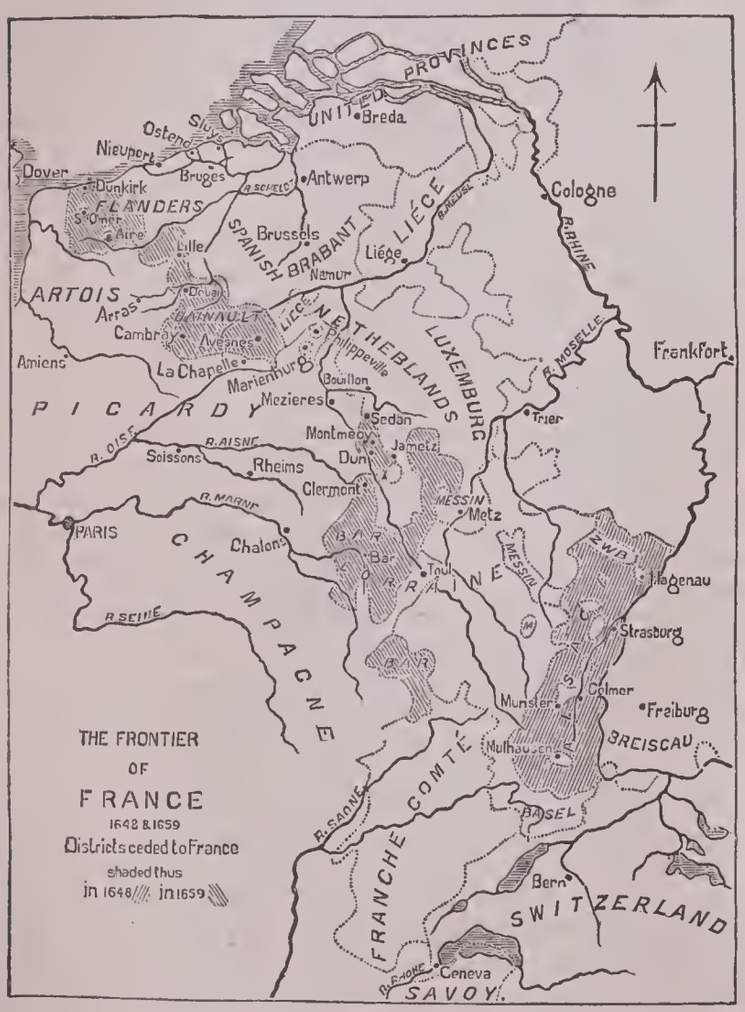
For years there had been negotiations for peace; they had taken definite form as long back as 1639 at Cologne. In 1643 the congresses of Münster and Osnabrück were set permanently going: at Münster, France, Spain, and the Catholic princes were to make terms with the emperor; at Osnabrück negotiations should go on between him and Sweden, and the Protestant princes; the results should be welded into one coherent treaty of peace. The Dutch and Spaniards made peace together in January, 1648, so ending their eighty years' struggle. The terms between the empire and Sweden were signed at Osnabrück in August; those between the empire and France at Münster in October, 1648. The quarrel between France and Spain alone remained unsettled. The peace of Westphalia, as was necessary, largely favored France. As the war had gone on, her growing strength, and at last her preponderance, had made this quite inevitable; yet in actual gain of territory France received but little, only Austrian Alsace being added to the kingdom. In influence and in relative strength, however, she grew much. The power of Germany was broken up; the princes friendly to France, the elector of Treves, the Palatine house, the house of Hesse Cassel, the Swiss cantons, were all strengthened. The three bishopries, Metz, Verdun, Toul, were ceded in full sovereignty to France, as was also Pinerolo; she might garrison Philipsburg; the chief Rhine fortresses, barriers against her ambition, were to be dismantled; Breisach remained in her

The peace of Westphalia.

1648. hands. Austria was cut off from the Netherlands, and was rendered almost powerless. Thus the foreign policy of France was finally triumphant, although Richelieu did not live to see it. He had marked out its course, had watched over the preparations for it, had set it in motion, and had seen it through its earlier failures and difficulties; then he bequeathed it to Mazarin, who, though far inferior to him in tenacity and unity of purpose, was perhaps better fitted to steer things to their end; for his subtle skill and flexibility were exactly calculated for the intricate mazes of long negotiations, and could well defend French purposes amidst the innumerable and conflicting claims and wishes of the states represented at the congresses.

Mazarin and home-affairs.

No sooner had the peace of Westphalia settled, as it did for long years, the basis of the public law of Europe, than Mazarin was obliged to turn his attention to home-affairs, in which he was never so fortunate as in his foreign ventures. It has been noticed that a singular movement, adverse to the claims of monarchy, was at this very moment sweeping across Europe. The rulers of every state seem to lose power, sometimes are overthrown entirely. The characteristics of the Thirty Years' War tended to produce this result,—partly by depressing Austria and Spain, partly by familiarizing men with the careers of brave adventurers not royal, not even princely, partly by arousing enthusiasm for strong Protestantism, as in the English volunteers who supported the Calvinist "winter king," or took service under the "Protestant hero," Gustavus Adolphus, partly also



Charts of Districts ceded to France in 1648 and 1659.[1]

by the results of the war, as seen in the acknowledged independence of the United Provinces and Switzerland, two republics finally freed from royal control. Besides this there was an aristocratic reaction which had brought down the monarchy of the papacy, as was clearly seen in the long pontificate of Urban VIII.; there was the popular reaction which was steadily destroying the absolutist theories of the Stewarts in England; there was a certain weakening of royalty in Scandinavia, whether at Stockholm or at Copenhagen. And France could not fail to feel the same influences

[1] Copied (reduced) by permission of the Delegates of the Clarendon Press, Oxford.

1648-1650 at work. Mazarin's easier rule allowed the princes and nobles whom Richelieu had steadily kept down to raise their heads again, and the lawyers who composed the parliament of Paris, flattered at having been allowed to pronounce an authoritative judgment on the last will of Louis XIII., and thinking themselves an institution parallel to the parliament of England, were also much disposed to take advantage of the childhood of the king, the weakness of the queen-mother, the easier disposition of the cardinal. The French people, who had much rejoiced when Richelieu died, thinking that his heavy burdens would be lightened, were deeply irritated to find that they had fallen into the hands of a greedy foreigner; that their financial position was worse and their burdens grew yearly heavier; that Mazarin allowed Emeri, a harsh and cruel creature, also an Italian, to manage the purse of France, and to plunder it at will for his own and his master's profit. These causes are quite enough to account for the outbreak of civil war in 1648. The only wonder is that this war, "War of the Fronde," or the Sling (a nickname drawn from the boys in the city ditches of Paris, who played at mimic fights with slings), proved so hollow and absurd when one sees engaged in it the great names of Condé and Turenne. The name of the Fronde was first adopted by the leader of the movement, the coadjutor to the archbishop of Paris, Paul of Gondi, who is best known to history as the Cardinal de Retz. The immediate cause of the outbreak was the attempt of Mazarin to punish the parliament of Paris for having brought about the dismissal of his corrupt agent Emeri. The news of Condé's great victory at Lens (9th August, 1648) had inspirited the court party, which counted Condé as its champion; and Mazarin determined to use the enthusiasm thus aroused to strike terror into the parliament. On the thanksgiving day for the victory, four members of the parliament were suddenly arrested, one of them being Broussel, "an old counsellor in his dotage, whom the mob loved for his rude manners and his fine head of white hair." All Paris was at once in an uproar; the coadjutor De Retz threw himself into the disturbance, obtained Broussel's release, and quiet for the moment was restored. The queen-mother and Mazarin, alarmed at the troubled look of affairs, fled from Paris to Ruel. The parliament took the lead in what seemed to be a revolution, and De Retz, a born agitator and demagogue, gave to the lawyers a popular force in the discontent of the Paris mob. Though the court had been induced to return to Paris in October, 1648, Mazarin thought it safer to escape with it again early in 1649 to St. Germains. Then the discontented nobles, chiefly influenced by that romantic intriguer, the duchess of Longueville, Condé's sister, united their cause with that of Paris and the parliament, and seemed likely to overbear all opposition. The prince of Conti, Condé's younger brother, the duke of Longueville, a crowd of others, and eventually Turenne himself, formed the heads of a new "War of the Public Weal." Condé saved the court; his siege of Paris, and the weariness of the people, who had to pay for all the brilliant follies of their noble allies, led to the peace of Ruel early in 1649,—a delusive peace, negotiated by the stiff pedantic president of the parliament, Matthew Molé. This movement marks the division between the Old Fronde and the New,—the Old the Fronde of Paris and the parliaments, the New the Fronde of the discontented nobles. These latter were by no means inclined to accept the agreement of Ruel; the second period of the Fronde began at once; Condé tried to play a middle part, intriguing with both sides, and equally disliked by both. He formed a kind of party of his own, that of the "petits maîtres," the frivolous young nobles, dazzled by his bright manners and warlike reputation. The chiefs of the New Fronde began serious negotiations with Spain, and Spanish troops entered northern France, descending as far as to Rheims. Anne of Austria, somewhat strengthened by the adherence of the Old Fronde, ventured now to arrest Condé, Conti, and Longueville, early in 1650. But the duchess of Longueville escaped, whereby the stroke was rendered a

The war of the Fronde.

The Old and the New Fronde.

1651-1658. complete failure. She carried Turenne over to the New Fronde, and he, supported by Spanish troops, threatened Paris. The three prisoners were sent down to Havre for safety; Turenne's Spaniards were driven back to the frontier, and the royal troops retook Rethel from them. Feeling that Paris was still too uneasy for him, Mazarin released the three prisoners, and withdrew to Brühl on the Rhine. His cunning thought was that Condé would certainly arouse jealousies and confusion, out of which the royal power might soon recover authority. Nor was he wrong: in the autumn of 1651 the Old Fronde had come entirely over to the court; De Retz, satisfied by the exile of Mazarin, was bought with a cardinal's hat; Condé withdrew, and roused revolt in Guyenne, where he was strong. He reckoned on the help of Turenne and the Spaniards in the north; but all calculations were certain to be vain in a war in which love and vanity, jealousies and mean ambitions, ruled supreme. Turenne at once went over to the court, and took command of the king's troops; Mazarin came back, the king's majority was declared. A struggle for Paris followed, in which Turenne showed himself the master of his great rival, first checking him at Étampes, and then defeating him completely in the suburbs of the capital (1652). Condé with the remnant of his force took refuge in the town through the St. Antoine gate. Next year, all being weary of the war, the young king was invited back to Paris; Condé withdrew into Champagne and joined the Spaniards, with whom he remained till the peace of the Pyrenees. The New Fronde was entirely broken up; the Old Fronde had long been weary of the whole affair; Cardinal de Retz was a prisoner at Vincennes, and his career was over. Ere long Mazarin, who had again withdrawn from court to Sedan, was recalled; the parliament of Paris, which in 1654 demurred to the heavy cost of the Spanish war, was ordered by the king to abase itself; its meetings were forbidden; for nearly a century and a half its political action was suspended.

All this "burlesque war," this "war of children, with a child's nickname," "comic in its origin, its events, its principle," as Michelet says of it, had been like the light scene which the skilful dramatist interposes between the great movements of his tragedy, at once to relieve the strained attention of the hearers and to heighten the effect of the catastrophe. It fills with light and merry motion the period between Richelieu and Louis XIV.; it was "the game of lively schoolboys in the interval between the lessons of those two stern and severe teachers." The

War with Spain.

Spaniards were still at war with France; and nothing so clearly shows their utter exhaustion as their inability to take any serious advantage of the troubles of their adversaries. The civil wars over, France soon drove Spain to the wall. Condé, in command of Spanish troops could achieve nothing; in 1654 the Spaniards failed at the siege of Arras, and the French took Stenay; Louis XIV., who was with the army, perhaps here imbibed that love of sieges which always marked his military career. In 1655–1656 the fortunes of the war were almost evenly balanced, the Spaniards having perhaps the best of it in the north; and troubles with the noblesse began again, while the new opinions and party of Jansenius of Utrecht, which had been condemned by Pope Innocent X. in 1653, found great favor among the French clergy, who disliked the doctrines and tendencies of the Jesuits. From this time to the end of the reign of Louis XIV. the Jansenists of Paris are in more or less open opposition to the court; in these days they sympathized much with De Retz. Now, however, Mazarin's skill as a foreign minister enabled him to triumph over all opposition. The strong

Cromwell and Mazarin.

government of Cromwell had in 1654 secured the tranquil progress of England by treaties with the chief northern powers and with Portugal; now in 1655 he had to choose between alliance with France or with Spain. Nor could he hesitate. Spain still spoke her ancient tongue—the tongue of intolerance and Catholic repression; France in Mazarin's hand had been willing to tolerate the Huguenots, and to aid the Protestant party in Germany. A treaty between England and France was accordingly signed in October, 1655, a treaty of peace and commerce; a little later it was followed (March, 1657) by an offensive and defensive alliance. Six thousand English Puritans, led by Turenne, made an immediate change in the character of the war, and the Spaniards began at once to give way. In 1658 Turenne caught them at the Dunes, not far from Dunkirk, and defeated them completely; Dunkirk yielded, and was duly handed over to the keeping of the English; the Spaniards were swept away, Gravelines, Furnes, Oudenarde, all fell; Brussels was threatened. In August of this year Lionne, Mazarin's agent, on occasion of an election to the Holy Roman Empire, concluded an agreement with the princes on the Rhine for the upholding of the peace of Westphalia; and France could show herself as the ally at once of England, Sweden, Bavaria, the ecclesiastical electors, the house of Brunswick. At last in 1659 Spain yielded, being utterly unequal to the strife. The peace of the Pyrenees gave to France Gravelines, Landrécy, Thionville, and Montmédy, and Spain also ceded all she held in Artois; though the duke of Lorraine was replaced at Nancy, the Duchy of Bar, and some smaller places along the Champagne border, were ceded to France. In Germany itself Louis XIV. secured Juliers to the duke of Neuburg, and the original trouble which led to the Thirty Years' War was finally settled eleven years after that war had ended. All French conquests in Catalonia were restored to Spain, while France became finally master of Roussillon and Conflans; Condé was pardoned and taken into favor. Finally, the treaty involved a great marriage compact between Louis XIV. and the infanta Maria Theresa of Spain. The actual marriage, which took place next year, was garnished with a dowry never paid, and with a renunciation by the infanta of all her rights to the Spanish crown or Spanish possessions, which was thrust contemptuously aside when in 1667 Louis XIV. desired to get hold of the Spanish Netherlands, or when forty years later he placed the crown of Spain on the brows of his young grandson Philip. The peace of the Pyrenees and this Spanish marriage firmly established Louis XIV. on his throne as the most powerful monarch of Christendom; it was time for Mazarin to withdraw and leave his pupil in full command of the realm. He spent the last year of his life in teaching the young monarch those lessons of king-craft on which he built up his career,—taught him to avoid a first minister, instilled into him a belief that ill-faith in treaties was good policy, and urged him to cultivate his "natural gift of dissimulation;" called his attention to the miserable state of finance, and commended to him his trusted agent Colbert, as the man best fitted to bring order out of confusion; finally he placed his own huge fortune, some ten millions sterling of our present reckoning, wrung from the misery of France, at the king's disposal. Louis, however, replaced it honorably in the cardinal's hands, who left the bulk of it to his nieces, and with part founded his "College of the Four Nations" for the education of noble children from the districts added to France in 1648 and 1659. To this college he bequeathed that splendid library which he had based on Richelieu's fine collection, and had admirably enlarged by the care and skill of his librarian Naudé. He had done what he could for arts, literature, and science, had established the academy of painting and sculpture, had pensioned Descartes in Holland, and had introduced at Paris the Italian opera. In all the solid elements of good government he was entirely wanting; and it remained for Colbert to struggle against his fate,—the fate of serving a grand monarch, who would neutralize his endeavors to secure financial and commercial prosperity for France. Mazarin died in March, 1661, leaving the state in the unfettered hands of Louis XIV., who, though now twenty-two years old, and a king for 18 years past, had as yet been little but a cipher on the throne.

1659-1661.

The peace of the Pyrenees.

Mazarin's end and character.

Nothing is more striking in all history than the contrast between the Louis whom men saw under Mazarin's tutelage, and the Louis whom France long adored as her Great Monarch. In the earlier period there was the dull and tranquil docility of a great creature which as yet knows not its amazing strength, and has as yet none of the ambitions of power, and has never tasted blood. His nature, developing itself very slowly and late, seemed to onlookers to be only heavy and commonplace; courtiers noted with keen eyes that the young prince liked amusements, and they promised themselves a bright and joyous reign, in which they would have free leave to spend as they liked the hardly-won wealth of France; it seemed to them perfectly natural that they should waste at will what they had never earned, and they fully believed that the young king would be their accomplice.

Character of Louis XIV.

1661. His capacity seemed to be small; he was timid and ignorant. Mazarin almost alone was not mistaken in him, and no one knew him so well; "he will set off late but will go further than all the rest," was his judgment, and a just one, on the young monarch's character. For he was serious, severe, obstinate; he learnt little, and that slowly; but what he did learn he never forgot. He would neither bend nor forgive; and when he had once taken on himself the heavy burden of his kingly duties he never flinched nor repined for more than half a century. From the beginning he declared that he would rule without a first minister,—this Mazarin had instilled into him as a fundamental law of his kingcraft; and he kept his word, although it became clear in time that it was quite possible to hold him in close leading strings, so long as he himself did not find it out. At first, however, he was determined to have only agents around him,—men of business who should never expect to become too prominent,—not great lords of church or state, but men of middle or humble origin. With them he was prepared to undertake any amount of dry detail work of public business. Without a sigh he dedicated henceforth four or five hours a day, or even more, to public affairs; his commonplace abilities, his instinct of orderliness, his love of minutiæ, his punctual routine, which would have disgusted a livelier prince, formed the happiness of his life. "His ministers," says Michelet, "might change or die; he, always the same, went through his duties, ceremonies, royal fêtes, and the like, with the regularity of the sun, which he had chosen as his emblem." With a morbid conscience, he easily became subject to his confessor; with a limited intelligence and great lack of knowledge, he was dependent on his ministers without knowing it; with a vein of small vanity in his character, he was not above being led by the flatteries of the woman he loved. Finally, Louis XIV., though heavy-looking, was handsome and majestic in person; no one has ever played the part of a king with such equable gravity and success; his dignity was as striking as his selfishness; for his heart was dull, and neither surprises nor warm feelings could throw him off his balance. His whole reign passed without his ever showing any real feeling for his poor subjects; and his indifference to the health and feelings of those nearest him, his treatment of his court, especially of the ladies of it, was such as nothing but their abject fear of him, and the meanness engendered by the atmosphere of such a court, could explain.

The machinery of his government.

Louis XIV. began his true reign in 1661 by dividing the business of government into three agencies. He placed all foreign affairs under Lionne, who had served him so well in the war against Spain; Le Tellier had charge of the army and was war-secretary, supported by his strong-handed son, the terrible Louvois; and finance was entrusted to Fouquet, the most brilliant and unsatisfactory of his ministers. All three were men of middle origin; Lionne came of a family of gentle birth in Dauphiny; Le Tellier's father was a lawyer; and Fouquet was a citizen who pretended (as many Frenchmen have since done) to be of noble birth. The king had at his side also Mazarin's most trusted dependant Colbert, grandson of a wool-seller of Rheims. It was thought at court, where Louis was no better understood than elsewhere, that Fouquet would before long carry all before him, and fill the coveted post of first minister of the crown. The queen-mother, seeing that the king did nothing for his governor Villeroy, and that he was stepping resolutely forward in the path he had chosen, complained bitterly of her son's ingratitude, and declared with a sneer that he "wanted to pretend to be a man of ability." Fouquet, ambitious and bright, a favorite with the queen-mother, the court ladies, the literary world, the Jansenists, a man who let the finances fall into hopeless confusion and stooped to dishonest representations to save his credit, was not the man to suit the young king, and in a few months' time he had fallen for ever from power, and Colbert sat in his place.

Colbert.

John Baptiste Colbert, who was minister of Louis XIV. for two and twenty years, claimed descent from a Scottish family settled in France, and his character, his common-sense, rigid principles, business ways and tastes, and his simple habits, were just what one might have expected from such an origin; "a mind somewhat heavy and harsh, but solid, active, unwearied in work." He was first named comptroller general of finance; he had also the supreme care of all home-affairs, and when the navy (after 1669) was first in his own and then in his son's hands, he may be said to have had charge of that also. Till Louvois succeeded to the ministry of war in 1666, Colbert's influence on all parts of the administration was paramount: and the young king, partly understanding what he was doing, and wholly desirous of doing his best, gladly seconded him in everything. At first Colbert found everything in the financial department in a melancholy state: more than half the sum gathered in taxes disappeared before it reached the treasury, and the expenditure had so far grown as to leave a yearly deficit of nearly twenty-two millions of livres. To reorganize the finances was his first task; and by stern dealing with intermediate officials, by fixing the interest of loans at a maximum of five per cent., by sweeping away masses of useless officers, he succeeded in so far reducing the cost of levying the taxes and the burdens of the state that in six years' time the position of affairs was reversed, and the treasury had a good balance in hand, while the burdens imposed on the people were lightened The years which preceded the Devolution war of 1667 are perhaps the most prosperous that France had ever seen. She made extraordinary progress in all directions. Even in foreign affairs her power was shown: she humbled the papacy, she asserted her precedence over Spain in the streets of London, she helped the emperor Leopold to resist the Turks and enabled Montecuculi to win a decisive victory over them at St. Gothard in Hungary, her fleets in the Mediterranean cleared away the African pirates. At home the triumphs of peace were far more splendid even than these warlike signs of power. Colbert's activity was unflagging; to reorganize the finances might have seemed enough to another minister; he regarded it as only the groundwork of his structure; on it he would raise a new and brilliant France, splendid among the nations, not only feared—that was something—but admired as well, and humbly imitated. So he set himself in these years to develop his country on every side. For agriculture indeed he would do but little, for his temper was the opposite of that of Sully. Sully, a great lord, and owner of broad estates, rated manufactures as of little value by the side of tillage; Colbert, a townsman, and of the middle classes, thought that the encouragement of agriculture signified the increase of noble wealth and privilege, while manufactures would tend to build up a rich and useful burgher class, obedient to the king and fruitful in taxpaying. He therefore devoted his attention to manufactures and commerce, and to the communications by land and water necessary for them. He made good roads, set on foot the canal of Languedoc, declared Marseilles and Dunkirk free ports. He then re-established old manufactures and introduced new ones, such as tapestries, silk, mosaics, cabinet-making, lace, cloth of gold, pottery, steel-work, and the like, a long series of "royal manufactures," the industries of taste and luxury, which can flourish only on the favor of the great. Colbert's system was therefore one of protection and bounties, and never enabled France to discover for what forms of labor she was by nature specially suited. The true wealth of France lies in her soil,—in her varied agriculture and the thrifty habits of her people; yet the world has ever believed that these "Louis Quatorze" ornaments, these works of art and of little use, are the special glory of French workmanship, the models of good taste. This royal direction thus given to French industry, though it only slowly (if at all) increased the true wealth of the nation, added largely to its credit, and heightened its splendor in the eyes of the world. On industrial movement commerce must naturally wait; and Colbert attempted much for the circulation of productions. He set on foot four great companies, though they never really prospered. Patronage and direction, which could establish and freshen manufactures, failed here. In the end Frenchmen, with little gifts for colonization, and no decided bias for the sea, learnt chiefly to produce for their own consumption. In these years, the same royal and official patronage was largely extended to letters and science as well as to the arts. The last was no doubt regarded as directly connected with the general progress of the favorite industries mentioned above; in building a great palace at ruinous cost, Louis XIV. and Colbert both thought that French industry was being encouraged, and money circulated. Versailles was under-

1661-1667

Manufactures.

Commerce.

The arts.

1667. taken in 1661 (it had previously been a royal hunting-box built by Louis XIII.); the famous colonnade of the Louvre, Perrault's work, was begun in 1665; Bernini was summoned from Rome that same year to assist in the great works. The buildings erected in this period have all the same deadness of style; they are splendid, no doubt, and crowded with ornaments; we note in all a want of spontaneous fire; no longer does genius create; talent, at the service of a master, can only copy or conceal its poverty under the cloak of rich ornamentation. The paving and lighting of Paris was a more beneficial work; the quays, squares, and triumphal gates of the period did much to make up for the abandonment of the capital by its kings,—for after the days of Henry IV. the Bourbons spent very little time in Paris. Colbert also established at Paris those new learned or scientific academies which were intended, after the pattern of the new Royal Society of London, to stimulate and direct the progress of knowledge. Such were the Academy of Inscriptions, founded in 1663; that of the Sciences, in 1666; of Architecture, in 1671. He also established the school of Rome, built the Observatory, and in every way did his utmost to advance learning and observation. In all, his practical principle was to trust to rule and organization, and to leave as little as possible to genius or national selection,—and French industry, arts, and sciences have all suffered accordingly. Nor was the case different in literature: here also Colbert desired to encourage and direct; the baneful patronage of kings finds here its highest example. For the true golden age of French literature scarcely touches the active reign of Louis XIV.; it is to Richelieu's time, when at the head of affairs was one who not merely patronized but who warmly interested himself in literature, that the greatest masterpieces belong. The 17th century saw two periods of literary activity, of which the earlier extends to 1661, and is the period of originality and fire; the later runs from 1661 to the end of the century, and (except for Molière and the great preachers) is lacking in character, if improved in taste and style. France has always been justly proud of her stage, little as we may admire its pedantic limitations, its unnatural heroics, and the frigidity of some of its finest efforts: we feel that we are among those who would have thought Addison's *Cato* far superior to Shakespeare. Still, in its own style, French tragedy produced masterpieces, and these chiefly under Richelieu and Mazarin, rather than under Louis XIV. Rotrou, who showed the way, died in 1630; the great Corneille wrote the *Cid* in 1636, *Les Horaces* and *Cinna* in 1639. After 1646 his powers declined, and though he still wrote to his life's end, no one now cares for his *Agésilaus* or his *Attila*. His brother Thomas, a far inferior dramatist, was worthily reserved for Colbert's days. Molière belonged to both ages; his *Précieuses Ridicules* appeared in 1659, *Sganarelle* in 1660, *L'École des Maris* in 1661, while the *Médecin malgré lui* (1666) and the *Tartuffe* (1667) belong to Louis XIV. Racine's earlier period, and the best part of him, extends to 1677; after that he fell under royal influences, wrote nothing for some years, and afterwards became the quasi-religious poet of the court; the *Esther* appeared in 1689 and the *Athalie*, which the French public treated with indifference, was printed 1691. In other lines of poetry Malherbe, the great purist of the century, who, as Boileau sung, "réduisit la muse aux règles du devoir," died in 1628; Benserade, a trifling wit, flourished with pensions from Richelieu, Mazarin, and Colbert; La Fontaine wrote many of his fables in the days of the *Précieuses*, and published his first volume in 1668,—he was one of Fouquet's friends, and therefore not likely to attract the favor of Louis XIV.; Boileau is properly of the later age; satire and comedy seemed alone able to thrive by the side of obsequious oratory.

Learning.

Literature.

The Devolution war. In these palmy days of the reign, Louis XIV. saw with pleasure war break out between England and the Dutch (1664). He was slowly preparing to take part in it against Charles II. when the death of Philip IV. of Spain changed his views completely. He made peace with England in July, 1667 (treaty of Breda), and plunged into those complications of European law and usage which interested him intensely. The Spanish succession question at once came up,—for no one expected Charles II. of Spain to live long or leave posterity; and the immediate question of the claims of the queen of France on a large part of the Spanish Netherlands occupied his energies. Louis and Lionne snapped their fingers at the queen's renunciations of her Spanish rights, and went even further; they made claims which, to modern international law, seem to be utterly indefensible. The claim for the Spanish Netherlands was based on the "Jus Devolutionis," the old feudal custom by which certain territories descended to the offspring, male or female, of the first wife, to the exclusion of the children by the second. Now Maria Theresa, queen of France, was daughter of Elizabeth of France, the first wife of Philip IV., while his other children sprang from his second wife, Maria Anna of Austria; and Louis therefore proposed to apply ancient customs of feudal lordship to international matters, to the transfer of territories from one monarch to another. The customs of different districts varied much; in one way or another he hoped to lay undisputed hands on the Netherlands, Hainault, part of Luxembourg, even of part of Franche Comté; he was prepared to support these flimsy claims by the stronger argument of war. To war it came; the king with Turenne overran the Netherlands in 1667; Condé, who was governor of Burgundy, overran Franche Comté in 1668. It was a little war of town-taking; places fell, like ripe fruit, for the shaking. Meanwhile Lionne, busy over the negotiations which sprang out of the succession question, had sketched out a partition treaty, in which Leopold and Louis arranged the whole affair to their liking. With this in hand the king, who had returned in high triumph to Paris, and who knew of Sir William Temple's Triple Alliance, which had been signed in the spring of 1668, made peace as easily as he had made war, and on May 2, 1668, signed the treaty of Aix-la-Chapelle, by which he restored Franche Comté to Spain, and secured the Netherlands. It was to all appearance a very moderate peace, and much enhanced the king's reputation; men did not know that it was meant to lay the basis for an entire reconstruction of the map of Europe, so soon as ever sickly young Charles II. of Spain had died; and that, every one thought, must follow very soon. The long reign of that prince (who lived till 1700) had much to do with the great wars which followed, and with the consequent exhaustion of France.

1667-1670.

"Jus Devolutionis."

Treaty of Aix-la-Chapelle.

Louis now set himself to break up the Triple Alliance; it was a combination opposed to all the diplomatic ideas and plans of France. Sweden was her old ally; and her policy was to encourage the two sea powers, England and Holland, to weaken one another on the water, so as to give France a chance of constructing a navy. Therefore she was necessarily jealous of the Alliance; nor was it hard to overthrow it. Sweden, as was said, had joined it as a speculation, and had her price; Charles II. of England could easily be bought; Holland thus left defenceless, having lost her barrier of the Spanish Netherlands, could expect nothing but the anger of her new neighbor. But how changed were the world's politics, when the three Protestant powers, England, Holland, and Sweden could unite, even for a short time, for the defence of their ancient foe, Catholic and cruel Spain!

The Triple Alliance.

The king's dislike for the Dutch is one of those things which illustrate the evils of personal rule. They were distasteful to him as Protestants, as burghers, as tradesmen, as a sea power, as a constitutional republic; they had given shelter to refugees who could not bear the brilliant despotism of France. Of old times French policy had favored the growth of the United Provinces, as a counterpoise to Spain; henceforward Spain and Holland were friends, and Louis was eager to revise the old lines of his country's foreign relations. So he at once made use of his connection with the small Rhine-princes, those unpatriotic Germans, who were ever on sale, and who almost till our own days sided with France against Germany. With them he arranged for a great flank attack on the republic; he secured England by buying over her king; the wishes and feelings of the people could easily be disregarded in these early days after the fall of the Commonwealth. In 1670 the treaty of Dover, that standing scandal of the Stewart period, was signed; it contained a secret clause, of which the second duke of Buckingham, who negotiated it with the fair duchess of Orleans, sister of Charles II., was ignorant. The two kings played their comedy behind the backs of the two clever negotiators, and laughed in their sleeves at them and at the English nation. Sweden had been easily detached

1671-1672. from Holland, and the Triple Alliance entirely swept away within two years of its formation. The efforts made by Leibnitz and others to divert Louis to a Mediterranean war proved utterly unavailing; Colbert's reluctance to furnish the costs of war was overborne; Lionne died in 1671, and was not there to guide the foreign policy of France; Louvois, the "brutal minister whom all men hated," was just rising to the height of his influence, and threw that influence in with the king's prejudices in favor of a Dutch war. Colbert was the man to be pitied; the rapid rise of Louvois, who wielded all the war-power of the kingdom, and whose reorganization of the army drained the resources of the treasury, not only lessened his influence, but made great war-expenses inevitable; and those terrible outlays were by no means undertaken in the wisest direction. In vain did the dry and common-sense minister try the way of flattery: he was too gross; he could not catch the subtle undertones of praise and adoration which pleased the Great Monarch's love of approbation. "We are bound," he writes, "to save a sixpence in things not necessary, and to lavish thousands when thy glory is in question. A hundred pounds for a useless banquet breaks my heart; but when millions of gold are wanted for a great object, I would sell all I have, pawn wife and children, and go afoot all my life, rather than fail to provide it." Such protestations, which did protest too much, such bathos of adulation, could not please the wilful monarch; Colbert's influence henceforward steadily declined, and Louvois climbed into his place, sitting as an evil genius at his master's ear, to whisper war with Holland, the crushing of Genoa, the double ravaging of the Palatinate,—the horror of which survives even to these days in which atrocities are popular,—the dragonnades of Nantes, the revocation of the Edict of Nantes.

Rise of Louvois.

The Dutch War.

The Dutch war broke out in 1672, and France had at last a considerable fleet to send to sea, Thirty ships of war joined the English navy. which was pledged to neutralize the sea-power of Holland, and to find employment for Admiral Ruyter's hands. Ruyter was the stay and strength of the aristocratic or burgher party at Amsterdam—the party which had now ruled for years, and had with no small glory rivalled England on the high seas. Little did Louis XIV. deem that by this war of 1672, and by this very alliance with England, he was laying the foundations of that power which would in the end frustrate his splendid plans, and hold up against him the liberties of Europe. The sea-party in the Provinces had resisted and overcome all the efforts of Spain. Louis was now about to overthrow that party, to make room for the land-party, which, led by William of Orange and England, was to withstand him to the end. The sea-party, the aristocratic and commercial republic, headed by the two distinguished brothers, John and Cornelius de Witt, was inevitably hostile to England, and as naturally friendly to France. The land-party, democratic and agricultural, and headed by the great house of Orange-Nassau, was naturally a friend to Germany, with which it had close connections, and to England also; for it was no rival on the sea, and lastly, William, the head of the house, was first cousin to the king of England.

Parties in Holland.

Louvois had raised the army to 125,000 men; the French navy could count about a hundred sail. With almost all this great force Louis began the Dutch war of 1672. Guided by Turenne he set forth for the Rhine, leaving an army to mask Maestricht. The friendly princes gave him passage; the trembling Dutch with a raw ill-disciplined army of scarcely 25,000 men, under command of the prince of Orange, sheltered themselves behind the half-furnished forts of the river Yssel. By crossing the Rhine into the ancient "Betuwe," Turenne hoped to get between the Dutch and Amsterdam, and with one hand to crush the army, while with the other he coerced the seat of government into submission. The plan was simple and good; the earlier stages of it were successfully carried out; the famous passage of the Rhine dazzled the eyes of all France, and, unopposed in fact, and perfectly easy, made Paris believe her monarch to be a complete hero of romance. Turenne at once pushed on and seized Arnheim, which gave him passage out of the Betuwe into the country behind the Yssel; and had his voice been heard, nothing could have saved the prince of Orange. But, with overwhelming force, the king missed completely the point of the campaign. He set himself to reduce the unimportant Yssel forts, led by his own taste for siege-warfare and Louvois's advice; 1673-1676. he wasted time and weakened his army by garrisoning the captured places. Presently he moved on and occupied Utrecht; Naarden, half way from thence to Amsterdam, was taken. The Dutch despaired of help, and offered terms to Louis; but he contemptuously refused them. Then the mob of Amsterdam in fury of despair rose on the De Witts and murdered them both, and called on William of Orange to rescue the state. He at once accepted the perilous task, and with equal skill and courage saved the republic, first by flooding the country, so as to defend Amsterdam from a land-attack, and then by arousing the jealousies of Germany and Spain. Louis had gone back to Paris; his armies achieved nothing more in 1672. In 1673 the interest of the war lay in the siege of Maestricht; for Germany was no longer a safe French roadway, and the line of the Meuse was necessary, if Holland was to be reached at all. Maestricht fell; but then no more was done. Louis returned again in triumph to Paris, and the war lagged. At this time (August, 1673) a great league of the Hague was formed against France; its members were the emperor, the Spaniards, and the Dutch; the young stadtholder became the leader of the opposition to Louis XIV. The campaign on the Rhine, in which William of Orange and Montecuculi were pitted against Turenne and Condé, while the duke of Orleans attacked the Spanish Netherlands, went on the whole against France. The allies took Bonn, and thus compelled the Rhine-princes to abandon France. The Great Elector, Frederick William of Brandenburg, who had hitherto leant towards the French, in 1674 joined the allies; public feeling in England forced Charles II. to make peace with the United Provinces. Sweden, jealous of Brandenburg, remained as almost the sole ally of France.

In this year Turenne was charged with the duty of defending the Alsace frontier; the war, from being offensive, had become strictly defensive, except in Franche Comté, which was retaken by Louis in a six weeks' campaign, and the ancient county now fell for ever into the hands of France. When the king's brilliant campaign was over, Turenne pushed forward into the Palatinate, defeated the imperialists at Sinzheim, and then deliberately destroyed the whole country; this was the well-known first destruction of that fair territory. The allies in September crossed the Rhine at Mainz and then at Strasburg, occupying all the plain of Alsace. It seemed as if Turenne could do little to arrest them. He observed them till winter had set in, and then, making his wonderful march along the west flanks of the Vosges mountains, suddenly came out in force at Belfort, and drove the Germans from point to point, till he had entirely cleared them out of Alsace. As the wasting of the Palatinate was the one great blot on his career, so this famous march raised his strategic fame to its highest point. In the north the campaign was not so brilliant; William of Orange lost the hard-fought battle of Senef, and was unable to carry out his plans for penetrating into France. When he had retaken Grave, the campaign of 1674 was over.

The campaign of 1675 on the Rhine was to be once more a trial of strength between Turenne and Montecuculi. The great Turenne, however, was killed by a chance cannon-shot, and the whole plans of the French were shattered. Marshal Créquy was defeated at Saarbrück; the advantages gained by the king in the north, where he had secured the Meuse by taking Liége, Limburg, and Dinant, were altogether neutralized; the army destined for Holland had to help the dispirited army of the east. Condé, who here fought his last battles, upheld the honor of the French arms on the Rhine, and, having secured Alsace for his master, now withdrew from warfare altogether. The age of an inferior series of generals begins.

In 1676 the war was feeble; nothing was done in the north; in the east the Germans took Philipsburg, a place of the utmost value to France before she had got Strasburg. On sea, however, the year was far more brilliant; in the Mediterranean Du Quense in two great battles destroyed the combined fleets of Holland and Spain; and in the second battle off Palermo, Ruyter himself perished. Both France and Holland now began to wish for peace; the Dutch, seeing their navy ruined, and conscious that they could not recover Maestricht, were very weary of war; and the French were also fretting under the burdens of the struggle, which had ruined all Colbert's plans for the development of their commerce and wealth. Troubles broke out in more than

1677. one district. Negotiations went on, and war also. In 1677 the French arms were more successful; the duke of Orleans, whom his brother never forgave for it, defeated William of Orange at Cassel, and was never again put in command; the French overran all Flanders; the duke of Lorraine was completely defeated by Marshal Créquy. Towards the end of this year William of Orange was espoused to his young kinswoman, Mary, daughter of the duke of York, and early in 1678 King Charles was obliged to declare war on his royal patron. These things swelled the tide in favor of peace. The burgher party of Amsterdam, afraid of William's growing power, leant strongly on that side; Charles II. had never been sincere in his declaration of war, and gladly forwarded the wishes of Louis.

The peace of Nimwegen.

Finally, the peace of Nimwegen closed the war. The first treaty was one between Holland and France, which restored Maestricht, the only place William had not retaken, to the Dutch; a friendly treaty of commerce was attached to it. The second treaty was between Spain and France; while the king restored some strong place to the Spaniards, they ceded a chain of strong frontier-cities to him; France became mistress of Valenciennes, Condé, Bouchain, Maubeuge, Cambrai, Saint-Omer, Aire, Ypres, and other towns. They also ceded Franche Comté, which has ever since been French. Thirdly, there was a treaty with the German princes, which reaffirmed the treaty of Münster of 1648. France ceded Philipsburg, and retained Freiburg in the Brisgau. The peace of Nimwegen was but a starting point for further ambitious steps, yet it formed the highest point of the greatness of Louis. His fortunes seemed to rise a little higher through the "reunion policy" in the next few years; yet he was already beginning to descend from the topmost height. After this peace France could not enough praise and flatter her great monarch; all thought of resistance died away; the needy nobles flocked to his court and begged for place,—they did not dream of asking for power; the king absorbed them into all possible offices—army and navy, finance, in all were to be seen swarms of noblemen; it is to Louis XIV. that the absolute and fatal severance between noble officer and peasant soldier is due. The clergy were kept in fit subjection; no great cardinal now could overshadow the throne; the Jesuits were in full favor,—masters of speech, miracles of persuasiveness, they set the fashion of that age of pulpit eloquence, which is perhaps the most marked of the literary characteristics of the reign. These were the days of Bourdaloue and Bossuet. From this time to about 1685 the French monarchy stands at its highest; Europe is amazed and paralyzed; France if exhausted is full of glory; the king has become more august and magnificent as he has grown older, and now in the prime of life is, as has been said, "if not the greatest king, the finest actor of royalty the world has ever seen." One person, at any rate, was dissatisfied with and suspicious of the peace of Nimwegen; and that was William of Orange. Four days after the peace had been signed, he made a sudden attack on the French camp at St. Denis near Mons. Marshal Luxembourg was taken by surprise; but the French troops soon recovered and drove out their Dutch assailants with heavy loss. With this uncalled-for bloodshed the war ended. The history of the next decade of years in France justified to the full the disapproval William had so roughly expressed, though it could not justify the bloodshed and the failure at Mons. It was in these years that abroad and at home Louis XIV. carried out to the full his autocratic ideas,—the king all powerful at home, the kingdom omnipotent abroad. So in this time, while the other nations thankfully disbanded their armies, those of Louis remained on foot. Vauban was named commissary-general of fortifications, a new office, in 1677, and the moment peace was signed began to fortify and secure all the frontiers of France with strongholds which should be at once gateways for aggression and bulwarks against attack. Finding also that a complete scheme of defences demanded some points which were not yet in his hands, the king began that system of "reunions," as they were called, by means of which he applied old feudal rules to the acquirement of territories and towns in time of peace. Thus, for example, he filched Strasburg away from Germany, because he wanted that ancient Teutonic city to make his eastern frontier safe and aggressive. The peace of Westphalia to which that of Nimwegen, so far as it dealt with Germany, went back, had in it the feudal term "dependencies." When it declared a city to be ceded, it spoke of it as being ceded "with its dependencies;" and Louis XIV. having determined to push this phrase to its furthest application, established in 1679 and the following years three "Chambers of Reunion,"—one for the three bishoprics at Metz, a second at Besançon for Franche Comté, the third at Breisach for Alsace. These bodies inquired into all matters of feudal jurisdiction; and as these old usages, specially the episcopal ones, were wide and vague, they formed a convenient basis for decisions in which the claimant was both judge and executor of his own judgments. The French overlordship over many Germanic districts was at once affirmed and acted on; territories were occupied with French soldiers, and the strong points fortified or further strengthened; and before Europe well knew what was doing, the frontiers of France had been pushed forward into Germany, and so strengthened as to make it very difficult to wrest them again away. The Breisach chamber thus secured almost all the lordships in that district, and succeeded, partly by legal argument, partly by bribery, lastly by force, in winning Strasburg in November, 1681. At the same time by secret agreement with Charles III. of Mantua, the last of the Gonzaga-Nevers dukes, Louis XIV. became master of Casale, which seemed to secure his permanent influence in northern Italy. The capture of Luxembourg, Courtrai, and Dixmuyde, in the little war with Spain which was waged in 1683–1684, set the French frontier well forward on the north side of the three bishoprics. All went well with the monarch in these days. Unfortunately for his glory he had still thirty-two years of reign before him; and these years, the period of Madame de Maintenon, are crowded with blunders, darkened with misfortune. "Here ends," (in 1683), says the duke of Saint-Simon, "the apogee of this reign,—the height of its glory and prosperity. The great captains, the great home and foreign ministers, are no more; only pupils and disciples remain. We are now to see the second age, which will fall short of the first, though it will be far better than the third and last period of the reign." Colbert died in this year; in this year John Sobieski drove the Turks from the walls of Vienna; and from the day of their defeat, the fortunes of the Ottoman allies of France also began to recede. Above all, in this same year Louis XIV. was privately married to Madame de Maintenon, and she, with unbounded influence over him, intentionally or not, had a share in the worst errors of his reign.

Louis XIV. at his highest.

The system of "reunions."

1677-1683.

Madame de Maintenon.

Françoise d'Aubigné was a Huguenot by birth and breeding; in 1652 the comic poet Scarron, a cripple, and, as he called himself, "an abstract of all human miseries," married her when she was penniless and friendless; eight years later she was left a widow, and again without resources. She had a soft and gentle beauty, a grace and tact, a cold temperament and placid manner, which recommended her, by way of contrast, to Madame de Montespan, the violent and dangerous beauty who for several years reigned supreme over Louis XIV. At her suggestion poor Madame Scarron was engaged, in 1666, as a kind of nursery governess to her children, the duke of Maine and a daughter. It is curious to see how great are the contrasts in her history. At first Louis was offended and hurt at the introduction of this person at court; she seemed odious to him. He gave her the little Maintenon estate with a stipulation that he should see her no more; he thought her a precise and disagreeable *précieuse*. She had been the wife of a playwright, the centre of a little literary coterie; the king, with his instinctive dislike for literature, felt a distaste, almost an aversion, for her. Her placid temperament stood the trial well; after a time, when Madame de Montespan was unusually imperious, he would betake himself to the sweet gentleness of the governess, and cool his heated temper in her calm society. Her influence was all for good; she weaned him from Montespan, and did not take her place; she reconciled him to his poor queen, whom he had so long and so scandalously neglected; and when the queen died in 1683, the governess became the king's wife, and queen in all but name. She never was publicly acknowledged; still her position was recognized, and her power felt. Louis worked with her, consulted her in all things; she was a warm friend to the high Catholic party; though not openly subject to Jesuit influences (her early training making that

1683-1687. unlikely), she did work which the Jesuits could not but like. The king, naturally religious in a stiff and ignorant way, and Madame de Maintenon, narrow, placid, and obstinately afraid of intellect or independence, worked together towards the same ends. The necessity of disarming any suspicion the king might feel as to the leaven of Huguenot opinion still fermenting within her led Madame de Maintenon often to countenance things which she could not in heart have approved. She had known the light, and could never afterwards have fallen into utter darkness. Jansenists and Huguenots, in these years, felt the king's dislike increased; the eagerness for the submission of the one, the conversion of the other, grew day by day into an absorbing passion. And Louis had had no small temptation to interfere with the Jansenists. They held opinions which, his Jesuit advisers assured him, were of a fatal wrongness; and in 1682 they had sided to a great extent with Innocent XI. against him. His horror of independence of views combined with his horror of a divided allegiance, and led him to act promptly against them. He convoked a great assembly of clergy, which, under the influence of Bossuet, drew up those four articles which have often been quoted as the clearest statement of the liberties of the Gallican church, —liberties, that is, as face to face with the pope, not as against the royal power. These articles affirm (1) the independent authority of the secular power; (2) the superiority of general councils; (3) the inviolable character of the Gallican usages; (4) the fallibility of the pope except when supported by the assent of the church. There was talk also of a Gallican patriarchate, so far did the quarrel go. The Jansenists, the "Ultramontanes" of that day, seemed to side with pope against king. In these years the papacy and the monarch were not on good terms together. Innocent XI. looked with favor on the growing resistance, and rejoiced when Protestant William overthrew Catholic James of England. The Jansenists were thus kept down; the Huguenots were more severely treated, Louvois, unluckily for them, here taking the lead. Great numbers were bribed or threatened into giving up their opinions, others were driven to it by actual hard usage, until in 1685 Louis, believing that all had been converted except a small stiff-necked remainder, with whom he need not scruple to deal sharply, finally ordered the revocation of the Edict of Nantes, and therewith the total abolition of all the privileges unwillingly granted ninety years before to the Huguenots, and always permitted with a grudging hand. The severities of 1685, and the exodus of the Huguenots, finally brought that party to an end as a political organization. Whatever difference of opinions there may be as to the numbers who fled from the kingdom at this time, there can be no doubt as to the quality of them. They were the thriftiest and readiest hands in France; they carried the arts and taste which were till then the special gift of their country, to Spitalfields, or Amsterdam, or even to Berlin. They crowded into the armies which were arrayed against their oppressor; they helped to man the ships which destroyed the navy of France; they planted their industries in many places, and gave that wealth and prosperity to other lands which was driven from their homes. In England they influenced opinion not a little, and steadfastly supported the house of Orange against the Stewarts, friends of the king of France.

Bossuet's four propositions.

Revocation of the Edict of Nantes.

In this same year 1685 Louis pushed his plans in Germany also further than was prudent. He alarmed the greater princes by intriguing, seriously or not, for the imperial dignity, against the next vacancy; he alarmed the Rhine princes also by claiming the Lower Palatinate for Charlotte Elizabeth of Bavaria, the Princess Palatine, who had married the king's brother the duke of Orleans, and who in this prime of her fortunes and brilliancy almost scared the dismal court with her bright sallies and the freedom of her tongue. When the princes heard this claim, coming so soon after the loss of Strasburg, a claim which would have brought Louis into the very heart of Germany, —they hesitated no longer; and in July, 1686, was signed that great league of Augsburg which was the beginning of the long struggle between France and the rest of Europe. The emperor, the king of Spain, the Dutch, the elector of Saxony, the Palatine elector, and a number of lesser princes, all joined it; in 1687 the pope secretly acceded; the duke of Savoy and the elector of Bavaria also came in; the soul of the combination was William of Orange. It is a strange moment of history in which the pope and the emperor, the king of Spain and the elector of Bavaria, unite to resist the advance of Catholic France and the Catholic king of England. The league was at first purely defensive, and for two years held simply an observant and ready position. The tension, however, was too great, and by 1688 Louis saw clearly that peace could not last much longer. France had had peace for ten years, yet her strength had not increased; for the court had been very profuse in these days, and the "reunions" had cost somewhat,—the exodus of the Huguenots still more. The works at Versailles had wasted men and money; the great ministers and generals were dead, and the country was surely drifting into war again. In the last war the king's armies had followed two lines—that of the Rhine and that of Flanders. Then, however, war was being made on the Dutch alone; now it would have to be against the Dutch and Germans combined. To all appearance the hostility of Germany was likely to be more dangerous than that of Holland, and the Rhine had been proved to be the best roadway of attack for both countries. For this purpose the Cologne country, the electorate and its territory, appeared to Louis to be of the utmost value to him. Occupied with this idea, and not realizing either the force of the character of William of Orange, or the depth of dissatisfaction against James II. in England, the king now committed the great blunder of his life. A small demonstration against Holland would have made it impossible for William to make his attempt on England, and would have cost France very little in expense or risk. But when it came to decision, Louis and Louvois, here as ever his evil genius, were both in favor of securing the influence of France on the Rhine; both thought the dynastic question involved in the Palatinate to be more important than the great European question involved in the plans and movements of William. Moreover, the vacancy in the electorate of Cologne in 1688, in which question the pope was openly opposed to the king's nominee, excited the royal pride, and made interference in Germany a point of honor; a French garrison was sent to occupy Cologne. For these reasons Louis, underrating the danger elsewhere, and thinking that a threat would keep the timid Dutch quiet, despatched the dauphin to the east with the main army in September, 1688. He took Philipsburg; the Palatinate and the three Rhine electorates fell easily into his hands.

The league of Augsburg.

1688-1690

War with Germany.

Immediately William, freed from his worst anxieties, set sail for England, and the Revolution took place at once and without bloodshed. The Declaration of Rights was issued by parliament in February, 1689, and William and Mary were seated on the throne of England. James II. took refuge at the French court, and was established at the palace of St. Germains; his presence in France, and that of his family, becomes an element in the politics of more than half a century. And now Louis recognized the error he had committed; his troops were withdrawn from the Palatinate, which (again at the advice of Louvois) had to undergo that scathing of fire and sword which moved the feelings of all Germans, and gave earnestness to the war. Early in 1689 the Diet of Ratisbon declared war against France. The great duke of Marlborough, now only General Churchill, defeated the French at Walcourt near the Sambre; the French were also thrust back into Alsace and Lorraine King James was furnished with a strong force of troops and ships, with which he landed safely in Ireland, and almost all the island declared for him. A French-Irish court was established at Dublin. William III. sent Schomberg to the north of Ireland to make head against this great danger; and William himself followed so soon as ever he could venture to leave England. Things were looking very serious for him. The French had kept up communications with Ireland without difficulty; the English fleet was not thought to be loyal to the new government, for King James had been a sailor, and many of the higher officers were held likely to side with him. The battle of the Boyne (1st July, 1690), however, cleared away this peril. James lost heart, and fled to France; in a very short time the ascendency of William III. was secured in Ireland. It was not too soon. A very few days after the battle of the Boyne, Tourville, commanding the French fleet, had defeated the Anglo-Dutch navy

The English Revolution.

Affairs in Ireland.

1691-1697. off Beachy Head; and in the same month, Marshal Luxembourg won the battle of Fleurus from Waldeck with his German and Dutch troops. In Piedmont Catinat inflicted a grave defeat on Victor Amadeus at Staffarda. Still, the war of 1690 was in the end indecisive, thanks to the battle of the Boyne. In 1691 Louis seemed determined to make a greater effort, and himself besieged Mons, which he took in spite of the attempts of William to relieve it. Little, however, followed after the fall of Mons; the year was marked by the death of Louvois, whose brutal energy had done much to sustain the war. The campaigns of 1692 were to be differently planned; in Catalonia, in Piedmont, and in Germany, there should be no offensive movement; the whole energy of the nation should be staked on a fresh descent of King James in Ireland, and on a land attack on the Netherlands. The war was therefore to be a duel between Louis and William. Tourville was ordered to engage the English fleet wherever he might meet it; it was believed that Admiral Russell and half the ships would desert in action. The experiment was tried off Cape La Hogue, and with disastrous results to the French arms: it was the ruin of the French fleet, the shipwreck of King James's cause. In the Netherlands Louis in person invested Namur, and, again baffling William III., took that strong place, which carried the line of the Meuse, in June. This, which might have been the decisive success of the war on land, brought with it no results; the victory of Steenkirke, in which Luxembourg defeated William, ended the Netherlands campaign. Elsewhere, as had been planned, the operations of the war were insignificant. The campaigns of 1693 were also indecisive; although Luxembourg again defeated William at Neerwinden, the capture of Charleroi was the only result. The aggressive period of the war was coming to an end. In 1694 it became almost entirely defensive; and the death of Marshal Luxembourg in the first days of 1695 took from Louis his most fortunate general. Villeroy, who succeeded him, was a poor officer; the ancient credit of the French army was upheld by Vauban and Catinat. The war in that year was exceedingly languid. The generals were afraid of the court; the king rewarded and promoted the less able over the heads of the more capable. The recovery of Namur by William III. in this year showed how France had lost strength since 1692. In 1696 Louis succeeded in detaching Victor Amadeus from the allies by abandoning Casale and Pinerolo to him, and securing to him his Savoyard territory; and the duke's daughter was betrothed to the duke of Burgundy, the eldest son of the dauphin, the father of Louis XV. This defection of Savoy, the appearance of Catinat in the Netherlands in 1697, the renewed vigor of the French arms, the difficulty of governing England now that Queen Mary was dead, at last led William III. to accept the mediation of Sweden.

Louis XIV. was at least as willing to come to terms; France was worn out with the long war and its great sacrifices; and, above all, it was seen that Charles II. of Spain had not long to live. To be ready to deal with the great questions of the Spanish succession Louis agreed to terms which he otherwise would not have granted. The peace of Ryswick in 1697 was soon agreed to. Louis recognized William III. as king of England, and Anne, second daughter of James II., and a decided Protestant, as his successor. He ceded to the allies all places won from England, Holland, or Spain since the peace of Nimwegen, and consented to a Dutch garrison in each of the Spanish-Netherland barrier fortresses. These three powers had no fault to find with the treaty of Ryswick; Germany, however, was not so well pleased. She had made war chiefly to reduce the French hold on the Rhine; William had pledged himself that Strasburg should be restored; but, as neither England nor Holland would support him in demanding this of Louis, he was fain to make peace without it. The emperor and the princes were very unwilling to come in; at last, however, they signed a separate peace, in which they got back all places taken by France since Nimwegen, excepting Strasburg, and recovered all the strongholds on the right bank of the Rhine. Lorraine was restored to its German duke; the French candidate for the electorate of Cologne was abandoned; and the claims of the Princess-Palatine on the Lower Palatinate commuted for a sum of money. Germany had fair cause therefore to be well pleased with the result. Louis now turned all his attention to the Spanish question; and the failure of his candidate for the throne of Poland, the prince of Conti, in

The peace of Ryswick.

1697, perhaps made him all the more anxious to prepare the way for the great triumph which he hoped might be won at Madrid. The closing years of the century were passed in active negotiations for this object. The three houses which hoped to gain by the death of Charles II.,—for nations were now treated as the private inheritance of princes,—were the house of Bourbon, the house of Austria, and the house of Wittelsbach. Austria and France desired to acquire the whole heritage; the Bavarian elector would have been satisfied with a partition. The emperor Leopold, head of the house of Austria, desired the Spanish throne for his younger son the archduke Charles, nephew (by marriage) of Charles II., and grandson of Maria of Spain, spouse of the emperor Ferdinand III.; he was therefore only very distantly related to the dying king. Louis XIV. claimed, in spite of renunciations, for Philip his grandson, grandson of Maria Theresa, half sister to Charles II.,—Philip's elder brother, Louis duke of Burgundy, waiving his claim on his behalf. Lastly, Maximilian Emmanuel, elector of Bavaria, claimed for his son Joseph Ferdinand, on behalf of the child's mother, Maria Antonia, daughter of Leopold I. and Margaret Theresa, daughter of Philip IV. of Spain. Leopold I. was the only male cousin of the Spanish king, and his nearest male relation; and Charles II. had also married Maria Anna of Neuburg, Leopold's sister-in-law. Moreover, his rights had never been renounced, while Maria Theresa, on marrying Louis XIV., had renounced hers, and so also had Maria Antonia, mother of the Bavarian electoral prince. The knotty question, however, was not to be solved by paper-considerations; it was a matter for the law of the stronger, and the more unscrupulous; Louis XIV. therefore won. William III., earnest in his desire for peace, and anxious that France should get no additional strength, threw in his lot with the Bavarian prince, and thought that such a partition might be made as would satisfy all. Charles II. also was strongly in favor of the same cause, and made a will in favor of Joseph Ferdinand. This, however, pleased neither Austria nor France, and Count Harrach, the Austrian envoy, got the will annulled, though he could not persuade the king of Spain to recognize the archduke Charles as his heir. Directly after the signature of the peace of Ryswick, Louis XIV. sent the Marquis d'Harcourt, a most successful choice, to represent his interests at Madrid, and ordered Tallard to amuse William III. with a scheme for a partition-treaty. Harcourt was to intrigue for the whole succession at Madrid, while Tallard should make sure of a part at St. James's, in case Harcourt's difficult mission failed. William III. was only too glad to enter into the scheme; and a first partition-treaty was drawn up, by which France, Austria, and Bavaria each should get its part. This treaty Louis used against itself; for it was one of the most cogent arguments by which Harcourt succeeded in persuading the Spanish court and people that if they would keep the great inheritance unbroken, and not destroy the ancient kingdom, they must have the French prince as their future monarch. In spite of much ill-will and great discouragement, Harcourt won his way into the complete confidence of the court of Spain, and utterly outstripped the rough and unwise Austrians. Early in 1699 the young electoral prince died, and the first partition-treaty became void. A second treaty followed, though it was not accepted by Austria; and Louis XIV. in accepting it had no intention of keeping his word, unless it suited him to do so. French influences, from the moment that this second treaty became known at Madrid, were omnipotent with the Spanish court; and in 1700 Charles II. signed another will, in which he left the whole of the grand inheritance to Philip duke of Anjou. After some simulated, and perhaps a little real hesitation, Louis XIV. accepted the will for his grandson, and enjoyed for a brief while the triumph that it brought,—the triumph of successful diplomacy and of a vastly enlarged influence and power. As time went on, it became clear that the king of Spain would not always be the obedient servant of the king of France, and that the connection between the monarchies was a source of weakness rather than of strength.

1697-1700. The Spanish succession.

The partition-treaties

War did not break out in consequence, as had been expected; the English, who had disliked the partition-treaties, even preferred the acceptance of the will by Louis XIV. to the cause for which William, with his larger views of European politics, desired to fight; and Philip of Anjou became

Philip of Anjou becomes Philip V. of Spain.

1701-1703. king of Spain. Louis XIV. protested at once against the view that the two crowns of France and Spain should never be united,—though he had used their certain separation as an argument to influence Spanish opinion,—and reserved the rights of Philip V. to the French crown; in 1714 there was only one person, and he a sickly child, between him and the hereditary right to the crown of France. Though war did not follow at once, it could not long be delayed, and meanwhile Louis XIV. did all he could to strengthen himself. Early in 1701 he made an agreement with the elector of Bavaria, governor of the Spanish Netherlands, and ejected the Dutch troops from the barrier fortresses. It was a haughty denial of the validity of the peace of Ryswick; and, in open violation of the spirit of the same treaty, he soon after, on the death of James II., recognized James Stuart, his eldest son, the "Old Pretender," the "Chevalier de Saint George," as king of England, under title of James III. About the same time the Germans and Dutch, thoroughly alarmed, signed at the Hague a great treaty, "the Grand Alliance," with William III., and bound themselves to restore the Netherlands barrier, to regain the Milanese territory for the empire, to win for the emperor all the Italian and Mediterranean possessions of Spain, to attack and take the Spanish Indies. The emperor, without delay, sent Prince Eugene, his greatest general, to begin the war in Italy; the double-dealing Victor Amadeus, the skilful strategy of the prince, the excellence of the fresh troops under his command, were too much for Catinat, who was obliged to fall back. Louis, who never had liked his best general, was not at all sorry, and sent Villeroy, one of his worst, to supersede him. Villeroy speedily justified his choice by losing the battle of Chiari (1701); almost the whole of the Mantuan territory fell into Prince Eugene's hands. After the surprise of Cremona, early in 1702, Vendôme, who, indolent as he was, was a good general, replaced Villeroy, and by the indecisive battle of Luzzara (August, 1702) recovered some of the lost foothold of France in Italy.

The war of the Spanish succession begins.

Ere this war had broken out on all sides. The death of William III., and the accession of Queen Anne, early in 1702, made no change in the arrangements of the allies for their four campaigns,—the Italian campaign, which was least in importance; the Belgian, in which they aimed at the fortresses; the German, chiefly on the Danube; the Spanish, in which the archduke Charles struggled for the crown. Catinat, transferred to the Rhine, and ill-supported by an unfriendly court at home, the ill-will of which was reflected in the conduct of his officers, could not make head against the prince of Baden, who crossed the Rhine and took Landau. Catinat, who soon after this sent in his resignation, was coldly allowed to withdraw, and France thus lost the most prudent and capable of her remaining generals. The elector of Bavaria was the only strong and true friend the courts of France and Spain had in this war; he bore the brunt of the early periods of it. Louis of Baden had occupied in force the strong elbow of hills and forests between the valley of the Rhine, and that of the Danube, thereby threatening the elector, and hindering him from joining the French. His position was very strong; yet Villars, who was ambitious and lively, and longed for the marshal's staff, determined to attempt the task of driving him out. He accordingly crossed the Rhine, and attacked the Germans at Friedlingen (14th October, 1702), and by good fortune rather than by skill defeated them. His success, however, was not such as to enable him to shake Louis of Baden; he could not even penetrate into the Black Forest. In the Netherlands Marlborough strengthened his position by taking a group of towns, and keeping Marshal Boufflers and the duke of Burgundy actively employed, as they retreated before him from point to point. The defeat of the French fleet in Vigo Bay, and the outburst of the Protestants of the Cevennes mountains, both added largely to the difficulties of France. In the winter Marlborough enlarged his base of operations by occupying the electorate of Cologne, and early in 1703 he had cleared out all the Spaniards in his rear or on his flank. Before the end of 1703 everything was ready for that great advance which was destined to raise his fame to its highest point. And it was time that he went, as he said, "to teach the Germans how to beat the French;" for in 1703 Villars had been very successful in Germany; he had forced his way through the Black Forest, and had joined the elector of Bavaria in the upper valley of the Danube; and the elector had already driven the Austrians down the valley to below Passau. A threatened attack on Vienna came to nothing. Towards the end of the campaign the elector and Villars drove Louis of Baden from his positions, and defeated Styrum at Höchstatt; Tallard, with the army which had watched Louis of Baden in the lines of Stolhofen, returned to the Rhine and took Old Breisach and Landau, as well as won the battle of Spires. On this side the war had been very favorable to France,—an advantage against which the transfer of Savoy and Portugal to the side of the allies had to be set.

1704-1706.

Marlborough's campaign of 1704.

These changes, and the continued resistance of the Huguenots in the south of France, enabled Marlborough to arrange with Prince Eugene his great campaign of 1704, in a conference near Heilbronn. Here the so-called triumvirate,—Marlborough, Eugene, and Heinsius—England, the empire, and the Dutch,—laid their plans to neutralize the French advantages in Bavaria, and by cutting the line of their communications, to relieve Vienna from all anxiety. The peril to Austria was great, for the French and Bavarians formed a long unbroken line from the Vosges to Passau. Quite early, therefore, in 1704, Marlborough began to move; he misled Villeroy and Boufflers, who were watching him, and crossed the Rhine at Cologne, with a view to joining Prince Eugene, who held the famous Stolhofen lines. The French and Bavarians drew together to meet this formidable attack; the elector entrenched himself near Donauwörth; Villeroy and Tallard observed the Stolhofen lines. Marlborough, with Prussian and other help, passed through Mainz, crossed the Black Forest, and came out in the Danube valley, joining Louis of Baden near Ulm. Their united forces defeated the elector and took Donauwörth. Thus doing, they had placed themselves between him and his French allies, Marsin and Tallard; and Marlborough, feeling his communications to be critical, and rather alarmed as to his position, drew back up the Danube, till he had effected a junction with Prince Eugene. The elector had also joined his French friends, and they lay in wait for their antagonists in a strong position on the left bank of the Danube, between Höchstatt and Blenheim. There, on the 13th August, 1704, was fought the great battle of Blenheim. The French and Bavarians had the superiority in numbers and position; this, however, they neutralized by faulty arrangements, and by shutting up a large force in the village of Blenheim. The battle was hot and heavy, and the loss to the allies, who were the assailants, great. Eugene made little impression on the lines, but towards evening Marlborough succeeded in breaking through Tallard's position. Thereby he cut the enemy in two, and the French cavalry fled in panic towards Höchstatt. Many were drowned in the Danube; Marsin and the elector drew off in good condition towards the Black Forest; Tallard was a prisoner, his whole force either dispersed or taken. It was the worst mishap that had ever befallen Louis XIV. Bavaria was entirely subdued; Austria and the empire saved; the elector took refuge in France. Louis of Baden was able now to cross the Rhine; Landau again fell into German hands; Marlborough returned to the Moselle, taking Trarbach and Trèves. The war drew nearer to the frontiers of France, and Germany ran no further risk of invasion.

The battle of Blenheim.

In 1705 the duke's plans for an attack on France were neutralized by the slowness and jealousy of Louis of Baden, who did not care to play second to "the handsome Englishman." The Cevennes insurrection being now over, Villars was free to face the allies, and did so with such skill and success that Marlborough was obliged to fall back towards the Netherlands. On the other hand, Louis XIV. weakened Villars in order to strengthen Villeroy in the Netherlands; so that the campaign of 1705 ended without any decisive operations. Not so 1706, the great year of the succession war. Louis XIV. fully intended that the Netherlands' campaign should have in this year decisive results. It was unfortunate for him that his personal likings led him to place in command on that side the incompetent Villeroy, who had to grapple with the victorious troops and masterly generalship of Marlborough. The result was that the duke easily won the great victory of Ramillies (23d May, 1706), which was as decisive as Blenheim; for as Blenheim swept the French out of Bavaria, so Ramillies made them powerless

The campaigns of 1706.

1706-1708. in the Netherlands. The allies took Louvain, Brussels and Malines, Ghent and Bruges, all in the name of the archduke Charles, whom they proclaimed king of Spain as Charles III. Antwerp, Oudenarde, all Brabant, accepted him at once. His fortunes seemed equally good elsewhere. The alliance between England and Portugal in 1703 had given a turn to warfare in the Peninsula. The archduke in 1704 tried to penetrate into Spain from the Portuguese frontier; this failed, partly from the difficulties of the country, and partly from the ability of the duke of Berwick, a natural son of James II., and nephew of the duke of Marlborough, one of the few real soldiers in the service of the king of France at this time. On the other hand the English fleet under Rooke, which was waiting on the archduke, by a stroke of happy audacity surprised Gibraltar (4th August, 1704), and occupied it in strength. The utmost efforts of the French, under the count of Toulouse, one of the natural sons of Louis XIV., failed to recover this all-important rock. The battle of Malaga, though the French fleet had the best of it, damaged their navy so seriously that they could attempt no more; and in the exhaustion of France it proved impossible to refit the ships, or continue the struggle on the seas. In 1705 Charles III., unmolested by them, sailed round Spain, and landed at Barcelona. The Catalans and Aragonese were inclined to support him, while proud Castile held by Philip V. These were the days of the romantic career of the earl of Peterborough. In 1706 the French and Castilian siege of Barcelona came to nothing; the party of Charles took heart, and supported by English, Portuguese, and French refugees, drove Philip out of Madrid, and placed their candidate on the throne.

War in Spain.

In Italy, the death of the emperor Leopold having called Prince Eugene away, Vendôme with unwonted energy defeated the Austrians at Calcinato, and swept the allies out of all the Milanese territory. Turin alone remained in the hands of Victor Amadeus II., and was the object of a fierce siege. Prince Eugene, however, returned in time to save the capital; for Vendôme, after Ramillies, had been ordered to the Netherlands, and the change of commanders was everything to the allies. Prince Eugene attacked the French lines at Turin; differences sprang up between Marsin and the duke of Orleans (the nephew of Louis XIV.), and the Austrians won a great victory. Marsin was killed; the French army would not obey the duke; the whole force melted away, and Italy fell completely into the hands of the allies. Thus in the Netherlands, Spain, and Italy, their fortunes by the autumn of 1706 seemed to be completely triumphant. In Spain, however, the Castilians succeeded in ejecting Charles III., and in replacing their favorite Philip V.; and in the opening of 1707, the victory of Almanza, gained by Berwick over Ruvigny, a French refugee officer of ability, finally settled the Spanish question in favor of the Bourbon dynasty. A treaty of neutrality for Italy, by which the emperor Joseph I. secured his conquests there, also released Louis XIV. from some of his anxieties.

The campaigns of 1707 were as unimportant as those of 1706 had been decisive. The appearance of Charles XII. of Sweden in Germany paralyzed both sides a while; Villars, in command on the Rhine, stormed the Stolhofen lines, and pushed into Bavaria, hoping that the Swede would join him with his invincible Scandinavians. Charles, however, cared not to unite his fortunes to the Catholic side, and after some delay marched eastward towards Poland. Villars fell back to the Rhine; Vendôme quietly watched Marlborough; on the sea Duguay-Trouin, the most brilliant of French captains, harassed the Anglo-Dutch commerce, and won very considerable advantages over the English fleet. In 1708 an expedition for Scotland failed completely; and in the Netherlands the duke of Burgundy and Vendôme were caught by Marlborough and Eugene at Oudenarde (11th July, 1708), and utterly defeated. The allies crossed the French frontier and sat down before Lille,—Eugene besieging, Marlborough protecting. By the end of the year the place had fallen into their hands, after a brilliant defence, which, though unsuccessful, won for Marshal Boufflers the distinction of duke and peer of France. Ghent and Bruges, with all Flanders, were secured by the allies; their light cavalry overran northern France, and appeared almost at the gates of Versailles.

The fortunes of France now seemed to be at their worst:

1709-1712. famine and a bitter winter closed the disastrous year; everything was at a standstill, trade completely ruined, finance in a dreadful state; even the king began to despair, and to negotiate for peace. He had felt his way thitherwards in vain in 1706; now in 1709 he made serious offers. The allies treated his proposals with great severity; he was willing to dismantle Dunkirk and ruin its port if Lille were restored to France, to give up his grandson's throne of Spain if Philip might have Naples; he did not absolutely refuse to abandon the electors of Bavaria and Cologne. With such concessions peace was not impossible. The allies, however, insisted on stipulations which touched the old king's personal honor, declaring that as Louis had placed Philip V. on the Spanish throne, he must, with his own troops, if necessary, dispossess him of it again. They also demanded the cession to Germany of Strasburg and Breisach, the erection of a new line of barrier-fortresses between Holland and France, and other lesser matters. To these Louis would not consent, and the negotiations broke down. He appealed warmly to the country to support him, and was answered by an outburst of patriotism which enabled him to send Villars, at the head of a good army, into the Netherlands. There he fought the great battle of Malplaquet (11th September, 1709), in which Marlborough and Prince Eugene were again victorious, though their losses were tremendous, as they had been obliged to attack a very strong position held by a powerful army. The fall of Mons was the only advantage which resulted to the allies; with that the campaign came to an end. While the battle actually restored the spirit of the French soldiers, who had been skilfully and successfully withdrawn from the field by Marshal Boufflers, it produced a very bad feeling in England. There men were very weary of the war, and the carnage at Malplaquet had been terrible. Louis again offered large concessions to the allies in 1710; the triumvirate, however, were not content to make peace, and still demanded what they knew he would not consent to—his personal interference against Philip V. The campaign of 1710, which followed, was intended to strengthen the allies, with a view to their penetrating the next year into the heart of France. Douai, Bethune, and some lesser places were taken; Villars covered Cambrai and Arras; in Spain Charles III. again entered Madrid, though he was unable to hold his ground there, and before the year's end Philip V. was again triumphant.

Malplaquet and its effects.

Change of opinion in England.

In this gloomiest state of French affairs, when all was in confusion and despair, the old king at bay and too infirm to head the remnants of his armies, the allies firmly planted in northern France, it was believed that, if they could but hold together, they would in one more campaign succeed in entirely breaking the power of their great rival. In England, however, that change of opinion had begun which saved Louis from this last humiliation. The Tory party, vehemently opposed to Marlborough and the war, were gathering strength; the elections of 1710 went in their favor, and early in 1711 the fall of the duchess of Marlborough at court told every one that the reign of the Whigs was over. The death of Joseph I., the emperor, by placing Charles III. on the imperial throne as Charles VI. (December, 1711), changed the whole position of affairs, and made men still more unwilling to carry on the war. It was felt that Europe could no longer sacrifice herself to place him on the throne of Spain as well as that of the empire, and to create a power which might endanger the stability of Europe, and overthrow the balance at which men were aiming. The warfare of 1711 was languid; Prince Eugene was called away to the imperial election; Marlborough and Villars long watched each other on the northern frontier of France. The only result was the capture by the allies of Bouchain, and the arrangement by Marlborough of "a grand project,"—a plan for the invasion of France in the next campaign, when he hoped to have Eugene by his side. In the winter, however, the duke was overthrown at St. James's, and his plans came to nothing. Negotiations for peace were far more to the taste of the Tories than a vigorous foreign policy; and it was announced, late in 1711, that Utrecht had been chosen as a place of conference; the bases of an agreement were easily arrived at. In 1712 the duke of Ormond replaced Marlborough in the Low Countries; his business was to neutralize the Dutch and Germans, who were still eager

1712-1714. for war; and in May England signed a separate truce abandoning her allies. They continued the war a while, but after being sharply defeated by Villars at Denain (24th July, 1712) they accomplished nothing more; the French retook Douai, Le Quesnoy, and Bouchain. Then the Dutch gave up all thoughts of further war, and came in to the English truce; war ceased on all hands, and negotiations went on merrily at Utrecht. At last, in April, 1713, peace was signed by all the powers except the empire on the basis of the treaty of Ryswick. The Germans, thus once more abandoned by their allies, found it impossible to continue long. Villars outgeneralled Prince Eugene, and by defeating him before Freiburg in the Brisgau, and taking that town, showed to the emperor that he also would do well to come to terms. In 1714 two more treaties were signed by the princes of the empire and the Austrians, and the Succession War at last came to an end.

The peace of Utrecht.

Results of the Succession War.

England was the chief gainer: she secured her succession through the house of Hanover, which now became a ninth electorate; the Pretender was to be compelled to leave France; the crowns of France and Spain were never to rest on one head; Dunkirk was dismantled; Newfoundland, Acadia, and the Hudson's Bay Territory were transferred from France to her; a friendly commercial treaty followed. Holland got a strong barrier on the side of France; the Spanish Netherlands were handed over to the United Provinces, which undertook to transfer them to Austria on the final conclusion of peace. She, too, made a favorable commercial treaty with France. The duke of Savoy was made a king and got Sicily, while Austria received Naples and Sardinia. Prussia received part of Gelderland, and gave up to France all her claims on the Orange principality. England was recognized as mistress of Gibraltar and Minorca. France recovered Lille, and retained Strasburg and the whole of Alsace. Freiburg in the Brisgau, Breisach and Kehl, she had to restore to Germany; the rights of Philip V. to the throne of Spain remained unshaken; the resistance of Barcelona, which obstinately refused to recognize him, was overcome by Berwick in 1714. Far lighter were the terms of peace than those which the triumvirate had tried to force on Louis XIV.; yet the aged monarch must have deeply felt the permanent retrogression which they involved. His splendid ambitions were shown to be unattainable, after they had well-nigh ruined France in the pursuit; she had paid already a terrible price for the glories of a grand monarch and a great age. It would require the awakening of the Revolution to restore her to her right place in Europe. Her old antagonists, Austria and Spain, were also losers by the war; north Germany, under the guidance of the new kingdom of Prussia, was destined gradually to reduce the supremacy of the south, and at last to take its place; England was fitted for the great destinies she was to fulfil in the course of the century; Holland, secure from all disturbance, withdrew from the political arena.

The calamities of France.

A short time before the conclusion of the peace, when things were almost at their darkest for France, domestic losses in appalling succession had stricken down the king. In April, 1711, the dauphin died; early in 1712 the duke and duchess of Burgundy and their eldest boy were carried off by fever; in 1714 the duke of Berry also died. And now of the direct line of the Bourbons remained only Louis XIV. and his great-grandson, the duke of Anjou, the future Louis XV. If the arrangements as to the Spanish crown held good, the dissolute duke of Orleans, whom Louis XIV. disliked and shunned, was the next heir after the little Louis. The country was famine-stricken and most miserable, finance in hopeless confusion, the debt grown to vast size; an annual deficit had long been going on. The whole of the institutions of the country seemed to have fallen into ruin. The nobles had become needy hangers-on at court; they filled the army, and by making it impossible for merit to rise had contributed largely to the disasters of the Succession War.

The brief remainder of this long reign was of little importance. The ignoble persecution, which had overthrown Port Royal in 1710, continued against the Jansenists to the end; and 1714 Louis tried to strengthen Madame de Maintenon's party against that of the duke of Orleans by decreeing the legitimization of his bastard sons by Madame de Montespan—the duke of Maine and the count of Toulouse,—and by making a will to secure the regency to the duke of Maine and Le Tellier, his Jesuit confessor. Then on the 1st of September, 1715, he died, leaving the crown of France to his great-grandson Louis, a child five years old. Madame de Maintenon, who had at last shown how wearisome was the task she had borne for thirty-two years, and how thankful she was in her old age to be relieved from it, abandoned the king just before his death, and withdrew to St. Cyr. And so passed away a monarch who had certainly been great, though not in the highest sense of that word,—whose soul had been beneath the level of his circumstances. It was with an instinctive movement of relief and pleasure that France heard the tidings of his death. The load of misery he had laid on the shoulders of his people had become too great to bear. He had used them, their strength and the labor of their hands, without stint or regret; but had never done anything to solace their woes, and in the worst and most famine-stricken times the wasteful expenditure of the court remained undiminished, and the cares of the Great Monarch never descended so low as to the poor people, whose fortunes the steady growth of the absolute monarchy had placed entirely in his hands.

1715. Death of Louis XIV.

For France the 18th century begins with the death of Louis XIV. The party which had surrounded the late king, the party of Madame de Maintenon, the Jesuits, the duke of Maine, represented the past; their opponents were ambitious to represent the future. At their head stood Philip, duke of Orleans, who had in extremest form all the characteristics of the Orleans branch of the Bourbon family,—who was brilliant and most intelligent, highly educated and cultivated; who was brave and capable as a soldier, full of good ideas as to the benevolent management of the people, and lastly, profligate and utterly without rule in his moral life, so that his better side was always neutralized by his worse qualities, and he ended by failing completely in his attempt to govern France on principles opposed to those of Louis XIV. Like so many of the prominent personages of the 18th century, his intellect grasped the future, while his vices clung to the past. Even while the old monarch's remains were being hurried with scanty pomp and tearless eyes to St. Denis, Philip of Orleans swept away all the arrangements of the royal will, and had himself declared regent, with full power to appoint his council of regency. The public opinion, as far as it could exist and express itself, warmly supported this *coup d'état*, and the party of the duke of Maine shrank into utter obscurity. At once the regent set himself to reform the government, and alter the foreign policy of France; in this he was guided partly by his knowledge of the plans of the late duke of Burgundy, and partly by the acute intelligence of his former tutor the Abbé Dubois; the duke of Burgundy represented also the virtuous, the abbé the scandalous, side of the new Government. In home affairs the regent's action aimed at a complete reversal of the late king's methods. He proposed to shift the work of governing from the king to the nobles; there were to be six business councils or boards,—for foreign affairs, army, navy, church affairs (the "council of conscience"), home affairs, and finance. This system of government failed, partly through the indolence of the regent, partly through the inaptness of the nobles for practical business. In church matters, the Jansenists were not unpopular and came back to Paris; Cardinal Noailles, head of the council of conscience, was moderate and tolerant, and the Jesuits felt that their power was much weakened. The regent even talked of inviting back the Huguenots to France; this, however, was beyond his powers. He had Fénelon's *Télémaque* published at last, as a kind of manifesto against the late reign, and a prophecy of the coming era of benevolent princes. He hoped to introduce throughou France the system known as that of the *pays d'états*, a system of local estates or parliaments, which should lead up to a real and substantive States-General, and make all the provinces alike in form of government. This also he could not carry into effect. In foreign affairs Dubois led; his main view was that France and Spain could not be friends, that Philip V. would gladly represent the old high Catholic interference in France, and would do his worst to overthrow the regent, whose character and ideas alike were odious to him. This being so, here was reason for another reversal of the late king's views; France should seek her friends among the natural foes of Spain —England under the house

A new age begins.

Philip of Orleans regent.

The reaction in France.

1717-1723. of Hanover and Holland. The marked Anglomania, the enthusiasm for everything English, which is to be seen at this time in France, worked in well with these new lines of foreign policy. With these views Dubois set himself to resist the bold schemes of Cardinal Alberoni, the adventurer, the would-be regenerator of Spain. In 1717 he succeeded in combining the three countries in opposition to Alberoni, and in 1718, on the emperor acceding to the league, the Quadruple Alliance (France, England, Holland, the empire) was signed. The detection of the Cellamare plot, for the overthrow and assassination of the regent, had enabled Dubois, just before this time, to get rid of all the Spanish party. He deported Cellamare, the Spanish ambassador, and imprisoned the duke of Maine and the leaders of that side; he also took for himself the post of foreign minister. War now began; England crushed the Spanish fleet; the imperialists, in British ships, seized Sicily; Marshal Berwick won some successes in northern Spain. The basis on which Alberoni had built was too slight to bear the strain of unsuccessful war; he fell, and early in 1720 the treaty of London closed this little war. Spain ceased thenceforward to cherish schemes of life and energy; the ancient kingdom lapsed once more into proud decay.

The Quadruple Alliance.

At this very moment France greatly needed some triumph and some tranquillity, for she was now rudely waking from new dreams of gambler wealth at home. The financial difficulties inherited from the late reign had baffled all the skill of the duke of Noailles, who presided over the council of finance. His "chambre ardente," with which he had hoped to cure the evils of the time by punishing and frightening financiers, brought no relief; and the regent, whose active mind and indolent disposition led him to adopt new and brilliant schemes, was carried away by the clever suggestions of John Law of Lauriston, an adventurer, in whose ready brain new ideas as to finance and banking teemed. He had hold of some half-truths respecting the real objects and character of money and commercial circulation. Paper money was a new thing; and Law believed that notes, based on the permanent wealth of the country, the soil, might be made to double the nation's capital, and relieve it of all its embarrassments. He was allowed to establish a bank of his own in 1716. This answered so well that in 1718 Government undertook the whole mystery of banking, with Law as director of the new Royal Bank. In connection with this institution, intended to set afloat paper supported by the property of the state, he started his famous Joint-stock Mississippi Company, with its grant of Louisiana, and all the unknown, and therefore marvellous, wealth and resources of the interior of North America. The shares were greedily taken up; the new bank notes seemed to afford an easy and inexhaustible supply of wealth, which would extinguish the debt, and set the country forward in lucrative enterprise. For a few months the fever was amazing; the wildest excesses of stock-jobbing and gambling were committed; on the wings of this paper-wealth the state should escape out of its difficulties, and private persons fly up to splendor. Law himself bought a handful of titled estates, and seemed to become one of the greatest men in France. Early in 1720, however, confidence was shaken, and then the bubble burst. Law stood his ground a while, but at the end of the year he was obliged to take flight, as poor as when he began. The embarrassments of France were not got rid of in this way; the royal bankruptcy which was impending would in the end pull down the monarchy. Dubois, who had prudently kept clear of this downfall, now turned his ambition towards church preferment; on his unworthy head were placed first the archiepiscopal mitre of Cambrai, then the cardinal's hat. His rise made it necessary for him to appease the Jesuits and depress the Jansenists, and this he did without a moment's hesitation. For a year Cardinal Dubois, as first minister, was the foremost man in France. He proclaimed the majority of Louis XV. in 1723; and just as his career of scheming, of clever unprincipled government, seemed crowned with fullest success, a little accident brought him to his grave. Four months later his boon companion the duke of Orleans was carried off by apoplexy. Thus had the long reign of Louis XV. begun with shameless vice and prosperous hypocrisy; as it began, so it continued to the end: and all the time the financial difficulties of the country grew apace. The debt, seed-plot of revolution, soon passed all power of management.

Cardinal Dubois.

1723-1734.

The young king had some chances given him; he had good preceptors, and intelligent people around his youth. His temperament was, however, entirely bad: the religious element in him was superstition and fear, which led him to mix up piety and debauchery in most ghastly connection; he was coldly selfish, indolent, vicious; the absolutions of his courtly confessors and directors gave him an easy conscience, if he had a conscience at all, and encouraged him to continue his career of shameless immorality, till at last his vices did what religion seemed unwilling to do,—they arrested the scandal of his life by bringing him suddenly and directly to his grave.

Character of Louis XV.

From 1723 to 1726 the duke of Bourbon, who had been president of the council of regency, was first minister. It is an obscure period, which produced only, through a back-stairs intrigue, the marriage of the young king with Marie Leczinski, daughter of that Stanislas who had been king of Poland, and was to be the last duke of Lorraine, and who rejoiced in the high-sounding title of the "Beneficent Philosopher." In this 18th century princes and great ministers adopted titles and phrases which in our days have descended to the level of the vendors of quack medicines. Still these affectations of princely humanity were a phenomenon of some importance in the period, as showing how the current of feeling and opinion was setting towards those principles of right, that love for mankind, that zeal for good works, which is based on the intrinsic equality of all men. The rule of the brutal duke of Bourbon and his mistress, the Marquise de Prie, came to an end in 1726, and then André Hercule Fleury, bishop of Fréjus, the king's preceptor, took his place. The statesman Fleury, and the church historian, contemporaries, are not the same person The historian was confessor to Louis XV., the statesman his tutor.

The Duke of Bourbon minister.

André Fleury, now first minister and cardinal, had the credit of being an upright and disinterested man,—Pope calls him "honest Fleury,"—and all society, from the king downwards, thoroughly trusted him. His honesty, however, was narrow and limited, and his home government obscure and uneventful. He made no scandals and attempted no reforms. Against his will and judgment he left his mark on foreign politics, though here, too, his was a "hand-to-mouth" policy, which involved no large view or grasp. At first he succeeded, with no little dexterity, in arresting the war which Austria and Spain, supported by Russia and Prussia, threatened against England and France. The congress of Soissons in 1729 arranged the points at issue, at least for a time. In the north, however, matters were more difficult, for here new elements had entered into the political world. The new ambitions of Russia under Peter the Great, and the consolidation of the young kingdom of Prussia, at once affected the position of Austria, involving that ill-placed state in fresh relations and duties; while the situation of Poland, amidst them all, was obviously threatened. France, of old the friend and always the romantic admirer of Poland, could not fail to be involved in the quick and unstable changes of the chivalric kingdom. This now occurred. In 1733, Augustus II. of Poland dying, the electing nobles, instinctively dreading the power of their neighbors, Russia, Prussia, and Austria, who had made a secret compact together as to Polish affairs in 1732, appealed for French help, and re-elected Stanislas Leczinski their king; he had been the nominee of Charles XII. in 1704, and had fallen with him. The Russian party among the nobles elected Augustus III. of Saxony, and as Austrian and Russian soldiers supported him, while France, in fact, did nothing but declare war against Austria, he seated himself firmly upon the throne of Poland. French influence for the time was utterly defeated, and Stanislas, after suitable romantic adventures, found refuge in France. The war with Austria, which began late in 1733, in 1734 occupied the last energies of the last of the old generals of Louis XIV. Marshal Berwick, commanding across the Rhine, was killed in the trenches before Philipsburg; and Villars, in Italy, after one brief campaign, in which he was thwarted by the duke of Savoy, died at Turin about the same time. The French fought well in this Italian war: they won a hotly-

The north of Europe.

The Polish error.

1735-1742. contested victory near Parma, lost a sharp affair at La Secchia, and defeated the Austrians at Guastalla. The Spaniards, taking advantage of the weakening of Austria in south Italy, landed Don Carlos at Naples, where he was warmly welcomed, and the "Two Sicilies" passed from Austria to the Spanish Bourbons. The French having taken Philipsburg were in a commanding position on the Rhine, while the Austrians were much weakened in Italy. The emperor therefore made proposals for peace, which pacific Fleury gladly met. The treaty of Vienna (3d October, 1735) seemed to secure French influence in central Europe; the Two Sicilies were made a kingdom for Don Carlos; Lorraine and ducal Bar were given to Stanislas Leczinski, who abandoned all claims on Poland, and at his death the duchies were to fall in to France; the duke of Lorraine was made heir of Tuscany, and succeeded to that government in 1737; France undertook to guarantee the Pragmatic Sanction of Charles VI. Charles VI., under whom the house of Austria daily grew weaker, was daily more eager for the flimsy security of this famous document, which aimed at ensuring the undisputed succession of his daughter Maria Theresa to all his possessions, as head of the house of Austria. Fleury, by acceding to this paper-guarantee, became all powerful with him, and induced the emperor to sign the peace of Belgrade (1739), by which the possession of that important city passed to Turkey. In these years Fleury's policy seemed thoroughly successful, and France was believed to be prosperous. Her prosperity, however, did not reach her people; the misery of the peasantry in 1738–1740 was exceedingly great; famine came each winter; the people died in crowds. D'Argenson in his *Mémoires* declares that "more Frenchmen died of misery in these two years than perished in all the wars of Louis XIV."

The Pragmatic Sanction of Charles VI.

The first Silesian war.

In 1740 died both the emperor Charles VI. and Frederick William, king of Prussia; the strength of the Pragmatic Sanction had now to be brought to the test. Charles VI. left no male issue, and his daughter Maria Theresa, married to a weak prince, Joseph of Lorraine and Tuscany, was his sole heir. To the throne of Prussia succeeded Frederick II., a slight and ingenious prince, who admired the French and played on the flute. He reigned for forty-six years, and was Frederick the Great. Instantly there was a scramble for the great and widespread lands thus left to a woman's care. Joseph of Lorraine failed to get the imperial crown; this, however, was a little matter, and after all it came to him in 1745. For the territories there were several claimants: Bavaria, Spain, and Saxony, all asserted their claims to the whole inheritance; the king of Sardinia wanted some Italian fiefs; the young king of Prussia laid hands on Silesia. France obviously lay outside the quarrel; yet it was hard to think, with Fleury, that a peaceful and reserved position was her best policy. A war-party, headed by the two Belle-Isles, Fouquet's grandsons, negotiators and soldiers, rose up at court in opposition to the old minister. All Europe ranged itself for or against the fair young queen of Hungary. England was warmly for Austria; France, late her ally, now hoped finally to effect the partition of the territories of the house of Hapsburg, and joined Prussia; Spain followed on the same side, being already at war with England; the elector of Bavaria and other German princes, Poland also and Sardinia, were on the same side. At first Maria Theresa seemed to have no friends save England and Russia. The first Silesian war had already begun by the swift seizure of Silesia itself by Frederick. The French plan was to repeat the German campaigns of the Spanish Succession War,—with Bavaria as an ally to cross into the Danube valley, and having taken the outworks of Austria, to threaten Vienna, and drive the queen to submission. The French army was led by Belle-Isle, who was made marshal for the occasion. It crossed the Rhine, pushed down the Danube, took Linz and Passau, and seemed to carry out its plan in full. Maria Theresa took refuge in Hungary; the elector of Bavaria had himself proclaimed archduke of Austria, and then, supported by French help, marched into Bohemia, and took Prague, the capital. He was now crowned king of Bohemia, and soon afterwards elected emperor (1742). Belle-Isle's schemes seemed all to succeed. Time, however, had told on the struggle; Russia began to intervene; England and Holland sent help to Maria Theresa; Prussia, securing the main part of Silesia, made peace with the queen of Hungary; and the French by the autumn of 1742 were left alone in Bohemia, face to face with the revived strength and spirit of the tenacious house of Austria. In mid-winter Belle-Isle was compelled to retreat from Prague, and after terrible sufferings and losses, brought his army back to the Rhine. In this campaign the one great general of the age, Maurice of Saxony, whom the French henceforth called Marshal Saxe, distinguished himself greatly. Early in 1743 the aged Fleury, whose last days had been embittered by the war and by its failure, died in his ninetieth year. Henceforward, Louis XV. had no one at his side to save him from the disasters of mistress-government, of which the malign influences grew yearly stronger. The war in 1743 again followed the ideas of Marlborough. The English and Germans hoped to command middle Germany, to capture or eject Charles VII. at Frankfort, and then to catch the French in Bavaria. With this view George II. and the allies pushed forward hastily to the Main, and, but for the equal rashness of the duke of Grammont, would have been intercepted and ruined by the French army. As it was, George II. won the battle of Dettingen, which in England was celebrated by Handel's famous *Te Deum*, and in France aroused vast merriment; for defeat in the 18th century meant the discrediting of the noble officers. The Parisians called the battle the "Journée des bâtons rompus,"—the day on which the marshals' batons were not won by D'Harcourt and Grammont. The French armies of Bavaria and the Rhine fell back into Alsace, and Charles VII., seeing how little help they could give, made peace with Maria Theresa. Her fortunes and hopes had risen vastly; she thought she saw her way to the recovery of Silesia from Prussia,—the recovery of Alsace and Lorraine from France. In 1744 war, which had slackened, renewed its force. A new league of Frankfort brought Frederick of Prussia again into the field. France undertook to reduce the Netherlands, and to check England by landing Charles Edward, the "Young Pretender," in Scotland. This part of the scheme failed completely. In the Netherlands the genius of Marshal Saxe accomplished all France desired; the barrier-towns had been neglected, and fell one after another. The ill-success of their army in Germany, and the vigorous attack of Prince Charles of Lorraine on Alsace, compelled the French to suspend operations in the Netherlands, in order to strengthen Coigny, who commanded on the Rhine. Their want of power spoiled Frederick's campaign in Bohemia; Charles of Lorraine returning thither forced him to withdraw into Saxony. In 1745, in spite of Frederick's wishes, the war on the French side returned to the Netherlands, and there, on the 10th May, the French army won its one decisive victory of the period, defeating the Anglo-German and Dutch forces under the duke of Cumberland at Fontenoy. Louis XV. was present in this action, and showed no lack of fire and bravery. This victory was decisive for the campaign; the Netherland towns fell fast. In Italy also the battle of Bassignano laid Lombardy at the feet of the French. On the other side Frederick the Great, though he still won great victories, felt that Maria Theresa was growing stronger. Her husband's ambition was gratified with the imperial crown; and at the very end of the year she consented to make peace, ceding Silesia to her vigorous rival, and securing the universal recognition of her spouse as emperor. The peace of Dresden (Christmas, 1745) closed the second Silesian war. France was now almost isolated; her successes in the late year seemed of little avail to her; the attempt of Charles Edward on Scotland was crushed (April, 1746) by the duke of Cumberland at the battle of Culloden; and the English sea-power began to show its vigor. Off the French and Spanish coasts England gave her foes no rest; in India she recovered Madras, which had fallen into Dupleix's hands, and spoiled the French plans for ascendency in the East. In this year, too, the French armies were very unfortunate in Italy, and lost all their command of the peninsula. The Netherlands campaign, guided by Marshal Saxe, alone sustained the honor of the French arms; Belgium fell completely into their hands. In 1747 Marshal Saxe, though he took Bergen-op-Zoom, failed before Maestricht; and France seemed as far as ever from being able to coerce Holland. In the following year the siege of Maestricht was resumed, but negotiations for peace intervened, and the great fortress was not reduced. The peace of Aix-la-Chapelle, of which the preliminaries had been signed in April, was finally

1743-1747

The second Silesian war.

The peace of Dresden.

1748-1754. The peace of Aix-la-Chapelle.

concluded in October, 1748. It greatly discredited France; the successes of her arms in Belgium, Savoy, and Nice, were of no avail against the strength her antagonists had developed. England and France mutually restored their conquests,—France receiving back Cape Breton and England Madras; the frontier fortresses, chief prizes of the late war, were handed back to Holland. France agreed to remove Charles Edward from within her borders, and guaranteed the succession of the house of Hanover. Silesia was secured to Frederick; the Pragmatic Sanction, in all other points, was once more accepted by Europe; the house of Austria also ceded Parma and Piacenza to the Spanish Don Philip. With this peace closes the long rivalry between France and Austria; when war breaks out again they will be allies.

Madame de Pompadour.

"To the government of an old priest succeeded that of a young mistress," says Michelet; for this was the time in which Madame de Pompadour rose to power. Her authority lasted twenty years,—the twenty years in which France sank rapidly in Europe into weakness and discredit, while her great writers were awaking all the dormant echoes of the world, and summoning together the forces which brought on the Revolution. The mistress made and unmade ministers at will, and changed the whole face of the foreign policy of France; the scandals of the court under her rule set men listening to the new ideas which spread swiftly through France; the more the noblesse descended in worth and strength, the more its younger members talked the language of modern humanity. Almost all, like the state, were more or less bankrupt, and unable by character, training, circumstances, to take advantage of the movement of society around them. When France awoke she scattered them to the winds.

The unsettled condition of Europe.

Europe was very far from being finally pacified by the peace of Aix-la-Chapelle; on the contrary, every one seemed to see rents and holes in it through which he might win new advantages. Frederick the Great was no doubt content with it, and so was England; others, however, were far from such feelings. Maria Theresa had reluctantly set her hand to the cession of Silesia, and scanned the horizon for help to enable her to recover that important duchy.

Rivalry of England and France.

France was almost as uneasy, for England had gained advantages which were in fact her losses; and she, too, hoped ere long to reverse the decisions of the treaty. In India her prospects seemed bright, under the brilliant leadership of Dupleix; in North America the peace had left very serious matters still unsettled, and it was hardly likely that any court save that of the sword could decide the difficult questions still open,—questions as to the limits of the Acadia which had been ceded to England; vital questions as to the connection between Canada and Louisiana, both still French territories; questions as to the islands off the coasts of America, the ownership and possession of which had been left undetermined. Acadia had been ceded without any definite statement as to whether the cession carried any portion of the mainland as well as the peninsula of Nova Scotia; and England claimed the territory as far as the shore of the St. Lawrence river. This was a smaller matter; the question as to the relation between Canada and Louisiana involved no less than the ultimate possession of all North America. For while England held the coast, and hoped to combine the wealth of agriculture with that of commerce, she had always behind her the long line of French possessions and claims, which interfered with her colonizing development, and threatened to push her back to the sea. For France had the Canadian lakes, the valley of the Ohio, and that of the Mississippi; she had communication with the sea on the north at the estuary of the St. Lawrence, on the south in the Gulf of Mexico. Were she to secure the connection through this long line, the English colonies would be terribly straitened and endangered; the French forts along the Ohio seemed a perpetual menace to English interests. Consequently the doors were scarcely shut on the negotiators at Aix-la-Chapelle, when fresh discussions began to spring up, and conferences were held, in a more or less angry tone, at Paris. In 1754 England, thinking that France was only lengthening out the dispute because she hoped to strengthen her navy for a fresh struggle, suddenly made war, without a proper declaration, and fell on French ships and forts whenever she could capture them. It was a high-handed and offensive proceeding. In India also an undeclared war was going on between the officers and forces of the East India Company and the French under Dupleix, which brought out the latent power of that young civilian, Clive, and ended in 1754 in the recall of Dupleix, and in a peace, or at least a cessation of warfare, between the rivals on the Indian shores. It was quite plain that before long this state of half-warfare must develop into a more serious struggle. To that also the whole movement of European politics speedily began to tend. For it was not only at Paris and London that negotiators were busy in these years; the Austrian court, eager for revenge on Prussia, and led by a strong and dangerous statesman, Kaunitz, was looking hither and thither for new alliances. The world had grown weary of the old lines of opinion, the old rules of policy, the old relations of courts. Kaunitz deemed himself the chosen instrument of a new departure, which would rearrange the map of Europe, and restore its proper authority to Austria and the empire. This statesman, father of modern diplomacy, and more especially of that side of it which has ever since been cultivated at Vienna, had administered the Austrian Netherlands in the last years of the late war, and had represented Austria at the congresses of 1748. In 1750 he was sent as ambassador to Versailles, and, as he watched the manners and temper of French society, persuaded himself that he saw his way to new combinations which might be very profitable for his mistress. The experience of Aix-la-Chapelle had convinced him that England was not trustworthy when her interests clashed with those of Austria. He saw how his country had suffered by the peace; it seemed to him that France would be a far better ally than England. Hitherto France had steadily played the part of friend and protector of the smaller North-German states, in their struggle against the dominance of the house of Austria,—this was a natural and necessary result of the secular rivalry against the Austro-Spanish power. Now, however, Prussia had taken up the post of champion of North-German interests and opinions; whereas France, by her new Bourbon relations in Spain, and her support of the Jacobites against the Hanoverians in England, had entirely changed her ground. She was far more likely to find a cordial friend in south than in north Germany; she had nothing to fear from Austria; she had much to lose or gain in the north; the Hanoverian interests of the reigning dynasty in England led the Guelfs to oppose the advance of France on the Rhine; the jealousies on other sides between France and England all tended in the same direction,—the direction of compelling France to look for new friends, and to abandon her ancient policy. Prussia became the inevitable ally of England; France began to look towards Austria. The disagreements between Austria and Holland as to the barrier-towns in the Belgian country naturally threw the sea-powers together; for neither Holland nor England cared to see Austria on that side, or to find a new rival rising up at Antwerp. Now, all political alliances are based rather on interest than on sentiment; and when it grew tolerably clear that the interests of England and France and those of England and Austria had become widely divergent, it became equally clear that new combinations must come. Austria was altogether implacable towards Prussia; England, or rather the English court, in its anxiety for Hanover, felt that Prussia could be no rival, and might be a good friend. Prussia was not a sea-power, and was a very near neighbor to Hanover. And so, when Kaunitz tried to persuade the English cabinet that it ought to join Austria in a war for the recovery of Silesia, he found so cool a reception that he at once turned elsewhere. His knowledge of France taught him how to succeed there; it must be by appeasing and interesting Madame de Pompadour; and the king of Prussia had lately offended not only her but her parasite the Abbé Bernis by his unpleasant trick of plain speaking; and the political independence of late years asserted for Prussia was also highly distasteful at Versailles. He knew that if he could overcome the reluctance of Louis XV., who clung to the older ideas of French policy, and persuade him also that Austria could be a good friend against England, he might succeed in reversing the political conditions of Europe, and perhaps win Silesia back for his mistress. He easily persuaded Madame de Pompadour; her influence was his from 1751; but the king was slow to move. Not till 1755, when the insults of England to the flag of France were too great to be borne,

1754-1755.

France and Austria.

Changes in European policy.

1755-1756. did he determine to accept the good offices of Kaunitz, and to threaten Hanover. England at once drew towards Prussia, Hanover being the bond of union between them. While the two Catholic powers formed their alliance together, and Madame de Pompadour, as men noticed with a smile, showed quite a fervor of devotion which seemed not in the least incompatible with her moral position, the two Protestant powers, England and Prussia, set themselves to resist the Catholic movement, and, if possible, to secure the triumph of toleration in northern Europe. In this France undertook an ultra-conservative line of policy, in union with her old antagonist; she ceased to lead, or even to sympathize with, the advancing states of Europe; it was the old world she would support, the new order of things could no longer count on her. And, besides all this abandonment of traditional policy, in itself no little risk, the new alliance made with Austria was, on the face of it, a political blunder; there was nothing to be gained by it, and much to be lost. For the essential points to which the whole care of France should have been given were across the sea, in Canada and in India; and here she was allying herself with the most inland of European powers, excepting Poland, which could scarcely be reckoned as a power at all, and bending all her energies to attack England by a march across north-western Germany into Hanover; hither went her strength, while the English were left to carry out unmolested the plans on which their future greatness hung. Had the new coalition been successful, Austria would doubtless have crushed Prussia, but what advantages could France have reaped from the war? Her position in it was that of quite an inferior and secondary power; the contest would exhaust her already diminished strength, and teach the world how low she had fallen; and if she failed, it would be little less than ruin to her. England, however, having (early in 1756) signed a treaty of neutrality with Prussia, France delayed no longer. On Mayday, 1756, the "Alliance des trois Cotillons," "of the three petticoats," as it was styled, the coalition of Madame de Pompadour with Maria Theresa and Elizabeth empress of Russia, was formally undertaken, to the vast delight of the French court and nobles, which longed for the pleasures of a great military promenade in such good society, assuming that the French people would, as usual, bear the cost, and leave to them the excitement and the glory. It did not turn out so amusing as they had expected. This treaty of Versailles was immediately followed by a declaration of war on the part of England; and Pitt before very long had smoothed over all difficulties which lay in the way of an offensive and defensive alliance with Prussia. The elder Pitt was regarded with as much fear and hatred by the court of Madame de Pompadour as the younger Pitt was by the republicans forty years later in the days of the Terror. The allies were chiefly tied by circumstances and mutual convenience to occupy different portions of the field of war,—England grappling with France, and Prussia with the Austrians.

The "Alliance des trois Cotillons."

The Seven Years' War.

At the beginning the French navy had no small share of success. During the peace great attention had been paid to it, and the growing importance of her commerce had reared for France no despicable school of mariners. At the outset of the war a great expedition commanded by Marshal Richelieu, who has the bad distinction of having done more than any other man to debauch and corrupt that apt pupil the king, set sail from Toulon harbor, and directed its course for Minorca, which was occupied by the English in force. Richelieu took Port Mahon and invested St. Philippe, on which the English had expended vast toil, hoping to make of it a second Gibraltar,—a second point of influence in the Mediterranean. A relieving force of seventeen ships, commanded by Admiral Byng, son of the first Lord Torrington, was handled so ill that it was defeated and driven off by the French fleet under La Galissonnière, and shortly afterwards the fort of St. Philippe was carried by assault in a very brilliant manner by Richelieu. With it the French became masters of Minorca, and Richelieu returned in glory to Paris. Very different was the reception of Byng in England. There the news of the fall of Minorca had created terrible excitement; the ministry fell, and Pitt took the reins of power in his hands. He and the old Whigs at his back were known to be anxious for vigorous measures, and for a hearty co-operation with Prussia. Byng was sacrificed to the resentment of the people; his incapacity and vacillation in the presence of the enemy were regarded as signs of treason, and he was shot as a traitor. 1756-1757

The war, thus favorably begun by France, ought to have been carried on by the same lines; her chief strength should have been directed to the sea. If fortune favored her still in the maritime struggle, she might fairly have hoped to win her cause in Canada and India. But the unlucky likings of Madame de Pompadour for Kaunitz and the Austrian alliance threw the country off its right course, and embarked it on a harassing and perilous Continental struggle. At first, though Spain, Poland, and Holland remained neutral, almost all the rest of Europe,—Russia, the elector of Saxony, the German diet, and Sweden,—declared for Austria; and after that Frederick's sudden invasion of Saxony in autumn, 1756, showed that the war was really begun, Louis XV. in January, 1757, declared war on him, and openly joined the league for his destruction. Hesse and Brunswick alone supported Frederick. For this France willingly abandoned her success on the sea. She had seen Pitt's first effort, the attack on Rochefort, fail ignominiously; she had driven off another fleet which threatened St. Malo and Havre; she had news of successes in both Canada and India; still, rather than make these omens of fortune her own, she turned aside to invade Hanover, and plunged into the larger war, in which she could never hope to win any real profit for herself. While Frederick was attempting in vain to crush the Austrians by reducing Bohemia, whence he was obliged to retreat after the disastrous battle of Kolin (18th June, 1757), the French army, 80,000 strong, and commanded by Marshal D'Estrées, crossed the Rhine, and directed its course towards the Weser. The English and their allies were commanded by the victor of Culloden, the unwieldy duke of Cumberland, who posted them behind the Weser at Hastenbeck; here D'Estrées overtook and defeated him (26th July, 1757). The victory was, however, not complete enough to please the French court, with whom D'Estrées was not popular. He was removed, and the duke of Richelieu taking his place pushed the English before him to the Elbe; at Stade the duke of Cumberland was compelled to surrender his army, and to sign the shameful convention of Kloster-Zeven (8th Sept., 1757), which permitted the defeated Germans to return home. Home also went the duke of Cumberland, shorn of his honors as the savior of the Hanoverian cause; him, however, the English did not shoot, as they had shot poor Byng. Marshal Richelieu having thus disposed of his antagonists, deemed that his work was done; it only remained for him to make the most of his conquest in the way of pillage; so instead of marching on Brandenburg, which was almost bare of troops, he contented himself with extorting a fine fortune from the Westphalians and Hanoverians, with which he built himself a splendid palace at Paris, the Pavilion de Hanovre. This was but a poor result, considering that it was believed that, had he pushed forward, he might have brought the war to an end in one campaign. His selfish indifference to the duties of high generalship wrought the ruin of his cause. While he lingered in Westphalia, the English began to recover from their panic; and Frederick, returning with incredible swiftness out of Saxony, arrested the course of disaster. The French army under Richelieu had been told off to overcome the Anglo-Hanoverian resistance; another army, under the prince of Soubise and the duke of Saxe-Hildburghausen, who commanded the troops of the German circles, was slowly moving towards Berlin, hoping to co-operate with Richelieu's victorious forces. Their progress, however, was rudely interrupted at Rosbach, on the 5th of November, 1757, by Frederick, who caught and utterly ruined them in a battle which cost him almost nothing, and was over in an hour and a half. Rosbach was one of the decisive battles of the world, little as it has been thought of by history. Perhaps it has never happened, before or since, that so hollow and slight a contest has produced such great results. At first it seemed like a mere comedy; the crowd of French captive regiments, the spoils of the camp, the bewilderment of the captors, the "host of cooks and players, of wigmakers and wigs and hairdressers, the parasols and cases of lavender water," the absurdly incongruous lumber with which the young French nobles had prepared for war, contrasted strangely with the gaunt and tattered soldiers of Frederick the Great, grim with war, privations, and forced marches.

The French in Germany.

The battle of Rosbach.

1757-1758. A shout of merriment rang through Germany, and was re-echoed from France herself. The light-hearted French were far from being depressed or vexed by the defeat; in the middle of the 18th century France was utterly indifferent as to glory, and the country saw in Dettingen and Rosbach not its own defeat, but the discomfiture of the frivolous noblesse; to the temper of the times these glaring instances of noble incapacity were rather pleasant than not. The effects of the battle on England were also very marked. It was there seen that Frederick's cause was not hopeless; and the English Government at once refused to be bound by the convention of Kloster-Zeven, appointing as commander-in-chief, in place of the duke of Cumberland, the vigorous and able Ferdinand, duke of Brunswick, one of the best soldiers of the age, who won and thoroughly deserved the respect and confidence even of Frederick the Great. Hitherto England had sent over nothing but money and the duke; now Pitt undertook to bring 20,000 Englishmen into the field, and henceforth England holds a principal place in the French side of the Seven Years' War. The greatest, however, of the results of the battle of Rosbach was its effect on public and national feeling in north Germany. Hitherto all men of cultivation and thought had turned to France for inspiration; all men of taste and fashion regarded France as the arbiter of their destinies in dress and manners; the French language was alone polite in courts and good society; the German tongue was counted rude and barbarous; Frederick the Great himself, the very champion of Germany against France, of modern freedom of thought against his Catholic opponents, the odd "Protestantium Defensor" of his medals, could never bring himself to speak or write German if it could be avoided. But after Rosbach the older fashion passed away; French manners, which before had seemed so beautiful, were now seen to be corrupt and frivolous; the slower Germans saw that their own manners and tongue were worth something; from the battle of Rosbach begins that upspringing of a national life in north Germany, which finds immediate expression in the splendid new-born literature of the day, of which the most direct and marked example is the *Minna von Barnhelm* of Lessing. In this way, then, the battle of Rosbach is an epoch in the national history of Europe. It restored the fortunes of Frederick the Great, and roused a new sense of national patriotism in the North-German peoples.

After 1757 the Seven Years' War may be considered as having two chief theatres,—that of Frederick against Austria, and that of England with Hanover and Brunswick against France and the lesser German princes, the "army of the circles." It is with the latter only that we have to do.

The campaign of 1758.

In 1758 France made great efforts to reorganize her armies, and fit them for decisive action in Low Germany. A new commander-in-chief, the count of Clermont, a weak offshoot of the great house of Condé, replaced Richelieu; Soubise, whose favor at court endured to the end of the reign of Louis XV., and who was the only courtier who ventured to escort that monarch's remains to the grave, was placed at the head of a new army. Under these two generals the court hoped to achieve good results in this campaign. The two main armies were directed, the one towards the Rhine, the other towards the Weser; that of the Rhine, under Clermont, had the strong position of Wesel, now in French hands, as a base of operation, and proposed to push on thence into Hanover, joining the other army under Soubise, which was to advance along the Weser through the Hessian country. Before, however, they could draw their scattered forces together, the new general of the allies, Ferdinand of Brunswick, was on them, and in a campaign which Frederick the Great did not hesitate to compare with that of Turenne in Alsace, he succeeded in dislodging Clermont from Brunswick. He speedily cleared the line of the Weser, recovering Minden, and driving the French under Clermont to the westward. They made no stand, and when they reached the Rhine at Düsseldorf, succeeded in crossing the river only with heavy loss of prisoners,—for Ferdinand stuck to their skirts like an avenging fury, and at last caught them at Crefeld, a little town between the Rhine and the Meuse, not far from Düsseldorf, where he inflicted on them a defeat which covered Clermont with discredit, and utterly ruined the prospects of the campaign. The Germans had now driven the French out of Hanover, Brunswick, and the Rhine provinces; Clermont was recalled, and withdrew into private life. He and his antagonist Ferdinand were both freemasons, and both had sympathies with the philosophical and political ferment of the age; yet the masonic brotherhood had not hindered Ferdinand from punishing him very severely in this campaign. Marshal Contades, a really good general, was sent to take command of the beaten forces; and Soubise, having won the battle of Sondershausen, and having taken Cassel, threatened Ferdinand's rear, while a reorganized army under Contades endangered his communications on the Rhine; they were twice as numerous as the forces he could bring against them, and he was obliged to draw back on Münster, giving up the whole left bank of the Rhine. There he hindered the junction of the two French armies, and compelled Contades to retreat again beyond the Rhine; while Soubise withdrew to the Maine, and lay for the winter about Frankfort and Hanau. So ended the German campaign of 1758, into which the French Government had thrown all its strength, and had once more got in return nothing but discredit, while the other interests of the country had been left to drift to ruin. The English fleets harassed the coasts of France, destroyed ships, burnt building-yards, took Cherbourg, and paralyzed her whole naval force. Abroad, she did nothing for the vital contests her sons were waging; the English took Senegal on one hand, and, in spite of the ability of Montcalm, mastered Louisburg, and Fort Du Quesne on the Ohio, which they renamed Pittsburg. At the same time the struggle in India, which had begun to turn against France, was restored by the brilliant courage of an Irish Jacobite, Lally, whom the French court named governor general. On his arrival he at once effected wonders, recovering the ground the French had lost; he vaunted that no Englishman should be left in the Peninsula. But Lally, brave and brilliant as he was, was also harsh and impetuous, arousing ill-will even by his good qualities. Nothing offended his subordinates so much as his refusal to allow them to pillage at will; and the bright opening of his career in India was very soon clouded over by disputes and insubordination among his officers, which foretold a coming failure.

1758-1759.

Affairs in India.

The mishaps of 1758 on every side at last awoke the Abbé Bernis from his dreams of security and glory, and that obsequious churchman, the henchman of Pompadour, in his cowardly alarm, instead of trying to repair the evil done, withdrew to his bishopric of Aix, giving place to an abler statesman, the duke of Choiseul, one of the most unfortunate of the noble ministers who have ever presided over the affairs of France. His first act was the signature of a second treaty of Versailles, in which he and Madame de Pompadour committed France to terms which plainly meant that France should bear the chief burdens of the war, while Austria should win all the fruit. For she promised to keep 100,000 men on foot, to support the whole Swedish contingent, to restore the elector of Saxony, to defend the Austrian Netherlands, and to support the candidature of Joseph, eldest son of Maria Theresa, for the title of Rex Romanorum, and the succession to his father in the empire, and finally to make no peace with England till Prussia had restored Silesia to Austria. With this amazing treaty France again went stupidly down into the contest, as an ox to the shambles.

The duke of Choiseul.

The campaign of 1759.

In 1759 the old blunders were again repeated; all was abandoned for the sake of the German campaigns; the Rhine army under Contades lay in the Cleves country; the Maine army near Frankfort was commanded by the duke of Broglie, who had already given sufficient proof of his incompetence at Rosbach. Between these armies, watching both, and purposing to hinder their junction, and, if he could, to beat them in detail, lay Ferdinand of Brunswick, now reinforced with twelve thousand English and Scottish soldiers, who had joined him in the last autumn. He thought himself strong enough to attack Broglie, but was repulsed with loss at the battle of Bergen on the Nidda, a few miles from Frankfort; and Broglie, made a marshal for this success, succeeded in effecting a junction with Contades at Giessen; thence they advanced together to the Weser, occupying one place after another. At Minden they paused before pushing on to overrun Hanover, while Ferdinand, having gathered all his forces together, came down to observe and check them. Difference arose between Contades and Broglie; the latter was successful popular, incapable; the former a good officer, whom the fatality which had beset the French court since the later days of

1759-1761. Louis XIV. had thrown into the cold shade; the two were hardly likely to work well together. Ferdinand took advantage of their errors, and (1st August, 1759) with much smaller numbers and the worse position, ventured on a great battle at Minden. The English regiments of foot, with unheard-of audacity, charged and overthrew the French cavalry, which, with amazing ineptitude, had been placed in the centre, as if it were the most solid part of the army. Had Lord George Sackville, who commanded the English horse, done his duty also, the whole French army might have been destroyed or made prisoners. As it was, the exploit of the "Minden regiments" rang through Europe; and the French army, hastily evacuating its positions, fell back to the Maine. Contades, the good general, was of course punished; Broglie remained in command. Later on, he showed his gratitude to the Bourbons by opposing the Revolution as an émigré. Henceforward Ferdinand was able to hold his own in western Germany, and England felt secure for Hanover. The French went on placing huge armies in the field for the rest of the war; yet thanks to "the most perfect incapacity," as Napoleon once said, of Broglie and Soubise, this great force achieved nothing, and succeeded only in still further discrediting the noblesse and the monarchy, while it exhausted with fearful speed the resources of the country.

The battle of Minden.

Nor did France pay the price here only; her efforts in Germany still hindered her from attending to her interests elsewhere; the disasters of her navy went on; her influence in Canada and India declined day by day. An attempt to invade England in 1759 failed completely; the battle of Quiberon Bay, and the cowardice of Conflans who commanded there, ruined the French navy; a squadron sent out to harass the coasts of Scotland and northern England, under Thurot, a real sailor, was attacked early in 1760 by a stronger force; Thurot was killed, the squadron captured, and so the French naval power came to an end. Henceforward, no help could pass from France to the outlying scenes of conflict. Point by point the English had advanced in Canada, until (September 13, 1759) the battle of Quebec, which proved fatal to both Wolfe and the brave Montcalm, finally decided the destinies of North America. That victory gave to England the ascendency over Canada, and secured to the sons of the Puritans the eventual mastery over the rest of that great continent. The fall of Montreal in 1760 was the close of the struggle. In India also French affairs had gone very ill in these days; the quarrel between Lally and Admiral d'Aché increased in bitterness; the English finally captured even Pondicherry, the last remaining stronghold of the French in India. This year 1759 is, on the whole, the most disastrous in all the annals of France; it proclaimed with a clear voice to all who would hear that the days of the ancient monarchy were numbered. The monarchy could not defend France abroad, it was dying of debt and corruption at home. It was little help to France that in 1760 the unhappy Lally, whom men in their vexation accused of treason, was brought home, tried, and shamefully executed at Paris. It was not on him that the eventual punishment would fall; in 1778 the generous voice of Voltaire made France confess her injustice, and restore to honor the name of the unfortunate and brilliant Irishman. His son Lally-Tollendal gave to the fallen monarchy a loyalty and support it surely little deserved from him.

The disasters of France.

Changes now began which pointed towards peace. The accession of George III. shook the power of Pitt; in France the subtle address of Choiseul had carried all before him, and he at last saw his way, too late, to reverse the direction which the efforts of France had hitherto taken. The war in Germany, always a blunder, should become of secondary importance; the active friendship of Spain and other Bourbon princes should restore something of the old sea-power of France. The king of Spain had also found out his folly in remaining neutral, while England grew to be supreme on the water; and consequently in 1761 the famous "Family Compact," the Bourbon league, was signed by all the sovereigns of the house of Bourbon. By it they made alliance offensive and defensive, guaranteeing the territories of one another, promising to support each other and to make no separate peace or war, throwing open reciprocally all their harbors and frontiers, and declaring that for war or peace, for trade or pleasure, France, Spain, Naples and Sicily, Parma and Piacenza, should count as but one country, one land blessed by Bourbons, and led by their great chief Louis XV. Here was a splendid scheme for the reconstruction of European politics! It was the Latin races clasped together by the Bourbon family, and determined to reassert their importance in Europe. Had the family compact been signed three years earlier, or had there been one man of real power among the Bourbons, its result might have been serious for the rest of the world; as it was, the chief effect of it was the resignation of Pitt, and the half burlesque ministry of Lord Bute. For Pitt got some inkling of this secret compact, and, confirmed in his suspicions by the equivocal language of the Spanish court, urged on his colleagues the necessity of declaring instant war on Spain, so as to crush her fleets before France could come to her help. But George III. would none of it; the ministers refused to take the bold step, not having the justification for it in their hands; and Pitt threw up the seals of office. When the compact became known to the world in 1762, England justified Pitt's foresight by at once declaring war; in a few months the Spanish navy had ceased to exist, and France lost her West-Indian Islands one after another. Bute with the young king stood aghast at the series of brilliant triumphs which signalized their efforts to bring war to an end. Meanwhile the French armies in Germany continued an inglorious if not any longer a disastrous career. In 1760, 1761, 1762, they still occupied Hesse and the Rhine country, fighting a few battles with varying success, and displaying in the clearest light the incapacity of their leaders. Negotiations for peace went on through 1762 between France and England, and before the year ended the preliminaries of peace had been signed, just in time to save Soubise with his 80,000 men from being ignominiously driven out of Hesse-Cassel. Frederick the Great, thus abandoned by George III., was also ready for peace. In February, 1763, the two treaties of Paris between France and England, Spain and Portugal, and of Hubertsburg, between Prussia and Austria with Saxony were signed, and closed the Seven Years' War. To French historians it had seemed, as Michelet ventures to call it, "an ignoble war;" a record of blunders and follies, met by shouts of derision at home; for the French people were, at the time, as much amused with the downfall of their incapable nobility as if they had belonged to a totally different race. It was as if they wished to say to Europe that these defeats and scandals were not the defeat of the French people, but of an intrusive clique of strangers; it was also as if the inextinguishable gayety of the nation could find even the ruin of the country comical. Doubtless, in more or less unconscious fashion, France felt that the war had brought the domination of the Bourbon monarchy and its noble flatterers nearer to an end.

1761-1763.

The Family Compact.

Close of the Seven Years' War.

The peace of Hubertsburg.

A summary of the stipulations of the peace of Paris shows at a glance how low France had fallen, how futile had been the Family Compact. She ceded all her claims to Nova Scotia, Canada, Cape Breton, reserving only her fishing rights and some small islands useful for that industry; she ceded all the territory which lay between the English settlements along the Atlantic and the line of the river Mississippi; she ceded the islands of Grenada, Saint Vincent, Dominique, Tobago. She received back Pondicherry, and a certain district on the east coast of India; she gave up Minorca, the one flower she had plucked in all the war, to England, and withdrew all her troops out of Germany. England came out chief gainer from the war; her development in these years was immense. To this time we owe the maritime supremacy of this country, and the spread of the English language and race to every shore. We have good reason to be proud of it, and to read with kindling eye the chronicle of our incessant advances. Yet it has, too, its dark side: a world filled with pushing Englishmen could scarcely be a paradise; there are races which object to being thrust aside; there are civilizations which English commonplace cannot supersede; the dull self-satisfaction of ordinary "Anglo-Saxonism" is at least as offensive as the livelier "Chauvinisme" of our neighbors.

The peace of Paris.

In the eleven uneventful years which form the remainder of Louis XV.'s reign the characteristics of the 18th century displayed themselves with clearness, and we shall do well to pass them briefly in review. In them we shall recognize at once most of the germs of those movements of the Revolution-era, towards

The state of France

1763. which affairs in France had long been tending. To begin at the top;—the court was so corrupt that we must go to the history of the most Oriental despots for a parallel. The king, coldly dissolute, idle, careless as to everything except his scandalous pleasures, and the direction of foreign affairs, which he kept in his own hands, shut himself up at Versailles, leaving Madame de Pompadour to manage everything, even the details of his own debaucheries; the infamous Parc aux Cerfs spread shame and misery among hundreds of families, and added heavily to the financial difficulties of the time. No member of the royal family was of any mark; the pious queen lived neglected and forgotten; the dauphin, whom the king disliked, because he did not wish to be reminded of his successor, was a friend of the Jesuits; there was no other prince of consideration. Consequently, all fell into Madame de Pompadour's hands; and till her death in 1764 she too might well have cried "L'état, c'est moi." And if the princes of the blood were ciphers, still more so were the nobles,—a needy well-bred throng, if of the older race, an obsequious and despicable crowd, if of the newer creations. To a large extent this proud noblesse was quite modern; for a long time noble fiefs had been changing hands rapidly; and as citizens grew wealthy they bought themselves into the sacred circle of privilege. No love of country, no desire to devote themselves or to resign their rights, existed in a body which had been steadily degraded by Louis XIV., had been tempted into display which meant debt, and had been carefully kept away from their estates, lest social independence should lead them to think and act for themselves. The more embarrassed and dependent they were, the better pleased was the spirit of absolutism, which thought it natural that they should crowd the army and disgrace the country in war by their vices, frivolities, and imbecility. When at last they had to stand up, face to face with the crisis of the Revolution, they were absolutely unable to defend themselves; their pride and poverty alike forbade them to sacrifice their privilege, and to submit to taxation with their fellow subjects. The clergy were cut asunder, and had a divided existence. The prelates, bishops and dignitaries, and the religious houses, on the one hand, were in all essential respects on the footing of the nobles, and took part with them. They, too, were privileged landholders, who could inflict heavy burdens on the people, while they would bear no weight on their own shoulders. These are the privileged classes, who brought about the Revolution. The king and his court, the nobles, and the upper clergy,—these chiefly caused it, and these were the chief sufferers from it. The rest of the clergy were a very different race; they were simple curés, parish priests, by birth and interest allied with the people, not with their lords,—men whose meaner position gave them a chance of being and doing good. Arthur Young, who travelled through France on the eve of the Revolution, bears witness to their general excellence and devotion to their duties. The burgher class in France had grown wealthier; manufactures were not unknown; trade increased rapidly; financiers, money-lenders, new nobles sprang from this class; the public creditor in these days grew to be a power in the state, very far removed from the peasant on the soil or the fierce artisan in towns, and yet advancing the revolutionary current by producing many of the writers, and much of the general intelligence of the time. By the side of them we may place the legal profession, that conservative body, which struggled in vain against all invasions of ancient usage, whether from the side of king or of people, and which in the end gave many victims and some leaders to the Revolution. In the country the state of the people was wretched, though it is true that in many districts the soil was already much subdivided, and the peasant proprietors numerous. It was reckoned that about a quarter of the soil was in their hands; yet their condition was little the better for this. Their burdens were still very heavy, their knowledge and methods of tillage rude; they had no capital to expend on the land, no good tools, no cattle, no manures; winter after winter they fell to famine-level, and sustained a miserable existence till the sun again revived them, and sent them forth once more to labor in the fields. Fortunately, the French winter is short; if, however, a long winter did set in, as in 1709, or again at the beginning of the Revolution, then the sufferings of the people were extreme, and multitudes perished of cold and hunger. The feudal aids and services—the corvée, the "pigeon-right," the game laws, the common wine-press, and common mill, and a hundred other oppressive and even fantastic services—left the peasant no rest, and forbade him ever to hope for comfort. As he gained in intelligence, and rose above the dead level of ignorance in which his masters had carefully kept him, he saw more and more to vex and anger him; as the people gained, they became more ripe for revolution. The robber bands in central France, and the inability of the authorities to cope with them; the growth of a large class of restless spirits, who dimly echoed some of the theories of the philosophers, and practised a new and lawless method of distribution of property, by robbing and destroying as they could; the diminution of population in the country, and the tendency of the land in the less fruitful parts to relapse into a wilderness,—these things all go to prove the wretchedness of the peasant life, and were all ominous of change. These conditions of the country, and the improvements of the burgher class, brought on another change which was little noticed at the time, though it afterwards forced itself on the attention of all Europe. For miles round Paris it became known that there was work to be had in the capital. In the 18th century Paris changed her character; no longer a mere court-seat or city of pleasure, she had gradually become a great manufacturing centre, and into her flowed crowds of dissatisfied or starving folk from all the country round. This immigration went on down to the great outbreak. It largely increased the city population, provided the rough material for the excesses of the Revolution, and helped to stamp the mark of Paris on the whole republican movement. It is hardly too much to say that the want of money at court, combined with the want of food in the cottage, brought about the explosion. These were the social and physical conditions of ferment,—the intellectual movement which dignified the Revolution with great names and imbued it with grand ideas demands brief independent notice.

The peasantry.

The capital.

The literature of the Great Monarch's time is usually assumed to be the golden age of letters in France. Yet if power and effect on the destinies of men and states be taken as the test, the literature of the 18th century far surpasses that of the 17th. Molière and Racine had been at the beck of the court. They never appealed to the people; still less would the lofty muse of Corneille care to speak to common ears. But in the 18th century, by the side of the superstructure of society falling fast to pieces, and the oppressed substructure, growing daily more restless, the authors formed a third and an independent power, eager to push on the ideas of the age, as they found expression in sciences or practical matters, or as they formulated an easy philosophy or announced as startling novelties the earliest commonplaces of political rule. And the significant fact is that these simple rules of political life were really a revelation to France, and for the first time set her people thinking on such matters. So completely had the country ceased to be a political body,—so completely had the pernicious principles of Louis XIV. destroyed liberty and constitutional life, that all had to be begun again; and the field seemed open, as well for what appear to us to be the most harmless commonplaces, as for the most startling speculations and theories. The difficulty was that to France the one was just as new and strange as the other. It must never be forgotten that the Revolution called on her not to amend a constitution, but to make a fresh start, from the very beginning. Moreover, this state of things necessarily placed literature in opposition to all existing powers. The ancient faith, the old traditions of noble lordship, the learning of the lawyers, all alike were attacked with unsparing hand; and literature built up for itself a strong public opinion of its own among the classes which had hitherto been as nothing in the government of the country. The 18th century literature of France received its first impulses from England. The age of Queen Anne, the advance of philosophy and natural sciences and of letters in England, the quickened connection between the two countries in the days of the regency, had enormous influence on intelligent Frenchmen. Montesquieu, a nobleman and a lawyer, with the temper of a constitutional statesman, was the advocate of political liberty, after the English pattern. Voltaire became the champion of tolera-

1768. tion and freedom of conscience, and had learnt from Locke; the Encyclopedists, following the English leaders in natural science, wrote their vast dictionary of human knowledge, in opposition to all established beliefs; and lastly, Rousseau, the sentimentalist, addressed himself to the sympathies of the people, and was, in the end, the chief teacher of those who carried out the Revolution. Voltaire began his literary life in 1718, with his *Œdipus*, an attack on priestcraft. He had been brought up by the Jesuits, and yearned to attack them; in 1725 his *Henriade* exalted Henry IV., afterwards the hero of all Frenchmen in the Revolution, at the cost of Louis XIV.; then he was in England for three years, and came back full of English deism and English humanitarianism. Henceforth his life passed in alternate attacks on courts and adulation of them; he withdrew at last into the Genevan territory, whence he directed the defence of the oppressed, if they fired his sympathies. Thence also he encouraged the progress of the *Encyclopédie*, which, more than anything, undermined the shaking fabric of society. Meanwhile Montesquieu, in his *Esprit des Lois* (1748), as well as in his previous work on *The Greatness and Fall of the Romans* (1734), appeared as a first master of modern French style, and as a champion of English constitutionalism in opposition to the despotism of France. Though his works have been perhaps more popular in England than in France, their effect on educated opinion was still very strong. His views did not prevail in the Revolution-period; still, they had no small influence destructively, by pointing out to Frenchmen how indefensible was the government under which they were willing to live. "The *Esprit des Lois*," said Count Grimm in 1756, "has produced a complete revolution in the mind of the nation. The best heads in this country (France) for the last seven or eight years have been turned towards objects of importance and utility. Government is becoming more and more a matter of philosophic treatment and discussion." The writers on political economy also deeply influenced the tone of the age; their doctrines effectually disposed of the faulty maxims on which financial affairs had been conducted since the days of Colbert, and prepared men to see the importance of Turgot's plans, and the significance of Necker's *Compte rendu*. Lastly, Jean Jacques Rousseau, the clockmaker's son from Geneva, began his seductive strains. Musician and sentimentalist, he hit the right tone for the popular ear; between 1759 and 1762 he published the *Nouvelle Héloise*, the *Contrat Social*, and the *Émile;* the *Contrat* was greedily devoured by society, high and low, as a revelation of a new code of politics, in which he boldly affirmed the sovereignty of the people, and the equality of all men, all being born free. His *Émile* was an attack on all existing ideas as to education; nature should take the place of the schoolmaster; and the priest and philosopher should alike be kept aloof from the training-ground for men and women,—for Rousseau was as little tolerant of the Encyclopedists and their science as of the Jesuits and their religion. Lastly, his *Héloise* dealt with the moral code of mankind, subverting many ideas, filled with noble, often impracticable sentiments, and leaving the impression of change and uncertainty even in those subjects which seemed least open to difficulty. He appealed to men's conscience and sense of right against the ruling vices and selfish immoralities of the day; and men, seeing these glaring evils sanctioned by the presence of the priesthood, if not by its participation, warmly adopted the new ideas, and desired a revolution in morals as much as in religion or politics. It was the outcry of nature against the infinite falsenesses of a complex and corrupt society. The great *Encyclopédie* was managed chiefly by D'Alembert and Diderot; the former traced its ground plan, and wrote the preface and some mathematical treatises, while the latter supervised it, and acted as the chief editor. The general tendency of the work was to attack religion, and to substitute in its place the conclusions of modern science: with D'Alembert and Diderot worked Helvetius the materialist, Holbach, Grimm, Raynal, and Condorcet, of whom the last represents that passion for man, that warmth of heart and sentiment, which draws him somewhat near to Rousseau. Among the great writers of the time must not be omitted the harmonious Buffon, who laid before his countrymen a splendid sketch of the material world and of the creatures that inhabit it. It is the work of a poet rather than of a scientific student: we find a cosmogony, an eloquent picture of man and man's fellow-dwellers on the globe,—if written with truthfulness or not we need not ask; at any rate, with skill and power he enlarges men's horizon. He too can praise God in his works, and in so doing can leave the established beliefs on one side. In all the literature of the age we see new grounds for speculation on every stage: theology, letters, sciences, natural history, politics, constitutional ideas, morality, all alike are grappled with by writers who shake themselves clear of existing trammels. Rejoicing in a new freedom, they familiarize the younger generation of France with revolutionary ideas in every line, and render the coming explosion more complete and more permanent than any movement that the world has seen since the first preaching of the gospel to mankind. 1763-1774.

Rousseau's writings.

The *Encyclopédie.*

Buffon.

At the close of the Seven Years' War the Society of Jesus was on its trial throughout Europe. The Order had changed its ground; it had long ruled in kings' courts, and was paying the price of the means by which it had gained ascendency therein; it had become both rich and troublesome to society. And the general tendencies of the times were against it; above all, it incurred the deadly hostility of those enlightened ministers who, in almost every court of Europe, were directing the new-born energies of states. Such men as Pombal in Portugal or Choiseul in France could not but resist Jesuit influences which clashed with their own, whether these regarded the interests of courts or the welfare of peoples. In 1762 the parliament of Paris, influenced largely by Madame de Pompadour, took their affairs, which had become secular enough, into its consideration, and decreed that the Order should be abolished. Louis XV., after some hesitation, confirmed their decision in 1764, and the Order was expelled from France. It is significant of the general movement of the period that the other Catholic powers speedily did the same, until in 1773 Pope Clement XIV. (Ganganelli) finally suppressed the Order. The fall of the Jesuits.

On the death of Madame de Pompadour in 1764, Choiseul still continued to hold the chief direction of affairs. His ministry, besides his belated foreign policy of the *pacte de famille*, was noted for more than one solid reform; he reorganized the army, instituted the *École militaire*, saw to the progress, so far as he could, of the navy, encouraged colonization, and in 1768 united Corsica to France. He represented the philosophic spirit at court, in antagonism to the Jesuit party, and the favor of Madame de Pompadour more than neutralized the king's dislike to him,—for Louis XV. was very jealous of any interference with the one branch of government in which he took interest, foreign affairs; and in these Choiseul was ambitious, if not very successful. So things went on till 1770, when a new mistress made the ground untenable for him. The low-born beauty, Madame du Barry, was the tool of all intriguers, and gained unbounded influence over the worn-out king. Choiseul and the Jansenists, who had enjoyed a brief tranquillity after the fall of the Jesuits, now went out of favor; the parliaments, which Madame de Pompadour had used and favored, were exiled, and in their stead came a new system of administration of law. The old purchase system, which gave stability to the parliaments, and dated from early Bourbon times, was swept away, and royal nominees were set to fulfil the functions of the parliaments. It was thought that the change from officials by purchase to officials by royal grace would be welcome. France, however, distrusted them, and said that the "gratuitous justice" so much vaunted, meant nothing but injustice guided by gratuities. Choiseul's policy. Madame du Barry. The Parlement Maupeou.

Louis XV. lived long enough to see the first partition of Poland (1772), that great blow to French influences in the north; nor could his interference hinder the signature of the peace of Kainardji in 1774, by which Russia, supported by England, got hold of the Black Sea shores. His effort to seize the Netherlands, as a counterpoise to these rapid additions to the strength of the northern powers, was a complete failure. Partition of Poland.

In the same year 1774 Louis XV. died,—died as he had lived, in flagrant vice. His reign of nearly fifty years had been a continual misfortune for France. During the period she is brilliant only in her literature, and even there we are conscious of something unwholesome and unnatural. Death of Louis XV.

Some years before this the dauphin had died, leaving a

1774. young son, Louis, who was married in 1770 to Marie Antoinette, daughter of Maria Theresa of Austria. This young couple, handsome and well-meaning, now came to the throne in 1774, inheritors of the terrible destiny which Louis XV. had prepared for his grandchildren. He, cold and selfish, had foreseen the coming tempest; but "it will last my time," he said, and cared no more about it; he felt as little for his grandson as for his country. In the midst of the scandals of the court Louis XVI. had preserved his purity, and with it a charming simplicity which, while it seemed likely to render the difficulties of his position less, seemed also likely to arouse men's sympathies for him, and find him friends in need. And in later days, when he deserved it less, men, even while they struggled against him, often fondly called him "their good king." He loved his people, as a good despot might, and tried to mitigate their misery in famine-times; his kindliness, however, was but weakness—his simplicity stupidity; he was obstinate and yet not firm; and his good and bad qualities alike made him incapable of grappling with the new phenomena of society which broke on his astonished sight. We find that in the most thrilling moments of his history, his chief anxiety often was how he might get out to his hounds. Marie Antoinette was a very different personage; she had much of her mother's high spirit; she was always a foreigner in France. In the early days of her beauty, when all Frenchmen were inclined to worship chivalrously at her feet, she shocked them by laughing at usages which seemed to them the ordinary course of nature. As time went on it was plainly seen that she came between the king and his tendencies towards reform; that she formed a court-party of her own, made and unmade ministers with no regard for the feelings of France, and no preferences except for the worse over the better public servants; that she more than neutralized all the king's economical wishes, and was extravagant and reckless; that in the crisis of affairs she led the king away from his subjects, and taught him to rely on German help. And so, while the virtues of Louis XVI. may have retarded the revolutionary outbreak for a few years, his weaknesses and the character of his spouse made the eventual explosion all the more complete and terrible.

The character of Louis XVI.

Marie Antoinette.

The opening of the reign was a period of hope; all seemed to go so well. The king and queen themselves were no common mortals: so young, so innocent, so graceful, they formed a strange contrast to the gloomy selfishness of the past. And roused by a gleam of hope, literature itself also passed into sentimental idyls; the court was itself idyllic; at the Little Trianon the king and queen played at farm and mill; the unreadable sentimentalities of Florian were the delight of Versailles; the innocent pictures of Gessner's pen had a great popularity; the days of Paul and Virginia were not far off. These things occupied and deluded the upper world; the middle world smiled in bitterness over the keen satires of Beaumarchais; the lower world starved and turned uneasily on its frozen couch. The well-meant attempts of the court to administer charities, "to make little alms and great galas," as Michelet phrases it, only served still more to irritate the discontented crowd.

Beginning of the reign.

At first all seemed well; the ministers of Louis XV., obscure and corrupt, vanished; some gleam of prosperity shone on agriculture, and the court was inclined to reduce the disorders of finance. No able statesman could the king find at the beginning; he was obliged to trust to Maurepas,[1] a frivolous and incompetent old man, who did the state one great service, for he led Louis XVI. to entrust the finances to Turgot. Turgot was a disciple of the economists, who had worked miracles of prosperity as intendant of the Limoges district,—a man of good faith, high character, and ability; but, like many others, he thought that what seemed so simple to him would at once commend itself to all, and entirely underrated the resistance which the interested noblesse and the court itself would make to his reforms. He at once proposed his remedies for the evils of the time,—the only true remedies—economy and the abolition of privilege. The state should spend less, and should draw its supplies from all orders of men alike. To the court and the nobles this seemed revolution and ruin: even the king was startled. Instead of supporting his minister manfully, he recalled the banished parliaments, and thought to shelter himself behind the law. The lawyers, however, special lovers of use and privilege, felt instinctively that Turgot was their foe; from that moment his fate was sealed. A great league was formed against him; the powerful help of the scandalous *pacte de famine*, the graiu-ring which had been established with the approval and participation of Louis XV., was enlisted in behalf of the privileged orders; a famine ensued in 1775, and lasted three years. Louis XVI. was frightened; all seemed to be against him; and at last in 1776 he dismissed his one great minister. "Turgot and I are the only men in France who care for the people," was the king's mournful complaint; it was time that the people should begin to care for themselves.

The ministry of Turgot.

1775–1780.

The *pacte de famine*.

Jacques Necker, an ingenious Genevan banker, who seemed to have the art of creating resources, now became finance minister. He was a high-typed charlatan, who grasped no principles, tried no heroic remedies, but thought only how to make credit and float the country over its difficulties. Unfortunately for him, the strain of war expenditure was added to his other burdens, for France was moved by her fate to take part in the American struggle now beginning. Necker's idea was that he might stave off the imminent bankruptcy of the state with paper and credit, and that, to be successful in this, he must lay the proper foundations of credit, knowledge and honesty in dealing. With this end before him, he wished from the beginning to issue his *Compte rendu*, and thereby to let France know how she really stood. This, however, he could not at first carry through, so that he was obliged to borrow for the state on his own credit, and to shift as he best might. People trusted him, and he crossed no angry and alarmed interest; but for the American war, he might have held out a considerable time. The war, however, was growing urgent. At first it had been volunteer work; for young French nobles, fired with a new zeal for liberty, went over to support the colonists in their struggle; and though the court at first was afraid of war, thanks to its embarrassments, it could only look with favor on this new sea-power rising up to counterbalance the overbearing supremacy of England. The most noted of the volunteers was the Marquis de Lafayette, who manned a frigate at his own cost. The Saratoga disaster in 1777 made more active measures necessary; the Americans were enthusiastic, and France, pushed by the popularity of the war at court, made a treaty of alliance and trade with the colonists early in 1778. Then began a great maritime struggle. England declared war on France, and tried to raise up embarrassments for her in Germany; but the skilful diplomacy of Vergennes, foreign minister of France, arranged the peace of Teschen (May, 1779), thereby avoiding a great European war, and also, in all probability, securing the independence of the United States; for it freed France from anxiety by land, and enabled her to push on her war at sea. An alliance with Spain against England followed. The war lasted about five years, and was marked at first by a striking revival of vigor in the French navy. The sea fight off Ushant (July, 1778), though it did not enable the French admiral D'Orvilliers to claim an actual victory, had revived hope and confidence in the country The war was waged in five theatres,—in the Channel, at Gibraltar, in North America, in the West Indies, and in India. The French attack on Gibraltar in 1779 was entirely foiled by the strength of the place and the ability of Elliot; the threatened descent on the English shores came to nothing; in the West Indies D'Estaing defeated Admiral Byron. In 1780, however the English roused themselves, and their more real strength began to appear. Rodney defeated the Franco-Spanish fleet, relieving Gibraltar and Minorca from blockade; then sailing for the West Indies, he helped the English cause against the insurgent colonists and their friends. At this time a new and powerful engine was set in motion against England; it was in 1780 that the system of the Armed Neutrality, in which French diplomacy had a hand, was proclaimed by Catherine II. of Russia. Freedom of navigation for all was asserted. England had insisted on visiting neutral ships, and on confiscating all warlike munitions; she defined these by a long list of articles possibly useful to a belligerent, such as timber or iron, out of which ships could be built. The contention of the empress was that the flag protects the cargo; also that neutral ships, if escorted by a neutral war ship, are free from visitation, and

Necker becomes finance minister.

The peace of Teschen.

The armed neutrality.

[1] [Jean F. Philypeaux, Comte de (1701–81), secretary of state at fourteen years of age, Pompadour drove him from Court, in 1774 became prime minister to Louis XVI., negotiated the American colonial alliance.—AM. ED.]

1781-1783. that a "paper blockade,"—that is a blockade announced but not supported by a sufficient force,—is not to be recognized as real. France, Prussia, Spain, Denmark, and Sweden, the kingdom of the Two Sicilies, Austria, all adhered to the Russian proclamation, and equipped armed ships to assert this new and liberal maritime code. When Holland also joined the other states, England at once declared war on her, and crushed her without mercy. As an immediate result, the French navy seemed to secure the ascendant in every quarter. De Grasse[1] defeated Howe in the West Indies, and sailed thence to support Washington and Rochambeau against Lord Cornwallis. The combination was thoroughly successful, ending in the famous capitulation of Yorktown (October, 1781), which indicated that the struggle between England and her colonies must soon end in the discomfiture of the mother-country. In 1782, however, things seemed to go better with England: in India affairs looked brighter; Rodney defeated De Grasse off Saintes in the Antilles; Gibraltar held out firmly, though Minorca had fallen. Later in the year England made peace with the colonists, and recognized the independence of the United States; it was felt that the new Rockingham ministry would be willing to make peace with France. And France, much as she had distinguished herself in the war, was too much exhausted to wish to push it further. The sea-rights of Europe had been asserted against England; America had secured her freedom; France had played a brilliant part, with one hand protecting Holland, and with the other giving independence to the United States; she, too, was quite ready for peace. In September, 1783, the treaty of Versailles was signed between France, England, and Spain. England restored to Holland the main part of her conquests, ceded Minorca and Florida to Spain, and to France her Indian possessions, confirming also the stipulation of the peace of Utrecht respecting Dunkirk. On the same day England also solemnly recognized the independence of the young republic of the West.

The treaty of Versailles.

France came out of the war with much honor on all hands; as champion of liberty abroad, as founder of republics, as apostle of new ideas, she could scarcely be expected to feel a stronger attachment than before for her own despotic monarchy. The contrast was all against the old régime, and the heavy debts incurred in carrying on the war had added greatly to the embarrassments of the crown. Moreover, Necker was gone. He had struggled hard against the inherent difficulties of his position and the persistent hostility of the court; at last he had persuaded Louis XVI. to let him issue his balance sheet, the famous *Compte rendu*, early in 1781. The document, afterwards shown to be erroneous on the side of hope, was an offence to the spending classes, an assault on their privilege, a kind of act of treason in their eyes; that the king should keep accounts, and lay them before his people, was in their view scandalous; from the moment it appeared Necker's fate was sealed. The *Compte rendu* was more clear than convincing; it made out an actual surplus of ten million livres; and Necker hoped that, seeing this, confidence would recover, and, like a prophecy of good, the *Compte rendu* would then accomplish its own statements and make a solid surplus. For France in these years had certainly been growing richer and stronger; the duties on objects of consumption had increased two million livres a year; and Arthur Young declared that "in these late days the advance of maritime commerce has been more rapid in France than in England. Commerce has doubled in twenty years." Necker had therefore a sound basis to go on; but the court could not endure life on such terms, and in May, 1781, he had to resign office. From this time the queen's influence was omnipotent over the feeble king. She ruled with a succession of obscure and incompetent ministers, —first Joli de Fleury, then D'Ormesson, who, when he resigned office, left only about £14,400 in the treasury, after having borrowed nearly £14,000,000 sterling in two years and a half. These men were followed by the "ladies' minister,"—the Fouquet of that age, even as Necker had been its Law,—Calonne, the "enchanter," the "model minister," as the court styled him. He found "two little bags of gold, with 1200 francs in each, in the royal treasury," —a rather slight foundation to begin upon. "There was," he says, "neither money nor credit; the current debts of the crown were immense, the income pledged far in advance, the resources dried up, public property valueless, the coin of the realm impoverished and withdrawn from circulation—the whole, in a word, on the very verge of bankruptcy." His idea was to mend matters by a gay and profuse expenditure; the queen should have whatever she wanted; "waste is the true alms-giving of kings" again became a state maxim; and all things should go on merrily, from minute to minute. So the great annual deficit continued unchecked. In the autumn of 1786 Calonne himself, in spite of his lively expedients and "gayety of heart," as he dragged the nation to its ruin, was forced to admit that the finances were in a hopeless state. He seemed to think that the privileged orders, which had so praised and petted him, would be flexible to one they knew to be their friend, and induced Louis XVI. to call an assembly of notables in 1787, before whom he laid the state of the finances and his proposals for reform. For forty years finance had been steadily going wrong; the deficit, which began in 1739, was a million and a third per annum in 1764; was, even in Necker's days, well over two millions; by 1786 had increased to more than six millions and a half; the best estimate Calonne could make for 1787 involved a deficit of five million pounds. Since Necker had come to power the total loans had amounted to fifty million pounds. Calonne, with irresistible force, argued from this that the ruin of the privileged classes impended. The argument was so unpleasant that they would not see it. He proposed that the *taille*, or land-tax, should be levied equally on all; that the odious right of *corvée*, which took the peasant's labor, and brought him under subjection to the lord, the intendant, and the money-lender, also should be swept away; that there should be free trade in grain, so that another *pacte de famine* might be impossible, and that all restrictions on traffic should be abolished. The notables replied with one voice (for they were all men of the privileged orders) that they would none of it. So Calonne fell, astonished at the ingratitude of his friends. Another queen's nominee, the incompetent Cardinal Loménie de Brienne, succeeded him. The anger of the people against the queen and her friends grew daily hotter; and, though she was absolutely guiltless in the matter, the scandal of the diamond necklace story in 1785–1786 seemed to give point to the popular discontent against her. She was frivolous and extravagant, and without the slightest feeling for the French nation; her love of amusement easily led people to take the worst view of all she did; she was identified in their minds with offensive foreign tastes and interests, and credited with French morals at their worst.

The result of the war.

The *Compte rendu*.

The mismanagement at court.

Calonne becomes minister.

1786-1787.

The accession to the ministry of Loménie de Brienne was the beginning of the end of the monarchy. He found at once that he must press on the privileged classes Calonne's proposals; and parties formed afresh,—on the one side the king, the queen, and the minister, supported by some of the noblesse; on the other the duke of Orleans, already beginning to take an active and ominous part in affairs, the main bulk of the nobles, and the parliament of Paris; the lawyers went with them in defending privilege. Below them all were the starving and angry people; in front of them the yawning deficit. The queen and her minister thought to save the ancient monarchy by abandoning the noblesse. To the people, however, it did not appear to be a question of one or other, but of their own claims and rights against both. No doubt the general bulk of the people would have welcomed a king who would reform loyally; Louis XVI., unfortunately, for all his honesty and well-meaning wishes, was not strong enough to face the difficulties before him.

Ministry of Loménie de Brienne.

In August, 1787, the king held a great *lit de justice*, or personal visitation of the parliament, to enforce the registration of his edicts, and after he had thus overborne its opposition, he exiled that learned body to Troyes. Though the edicts were for a stamp-tax and for the equal distribution of the land-tax, the popular voice went with the parliament; for the more ambitious and active spirits would not accept as sufficient the reforms recommended by the queen's party. Their temper was becoming dangerous; the king's action was considered arbitrary; the people of Paris still deemed the parliament their friend. Before being exiled, the parliament had uttered the word which was destined to bring things to a head. In declaring their forced registration illegal and void, they had stated, in their anxiety to escape the new imposition of the equalized "taille," that the States-General alone could

The *lit de justice* of Louis XVI.

[1] [A Provençal (1723–88), began service under the Knights of Malta. Died lieutenant-general in French navy.—AM. ED.]

1787-1789. legally impose taxes, a doctrine unfortunately unknown in France for many centuries. The whole nation heard the word, and learnt with emotion that the ancient monarchy had long been a usurper. Throughout the kingdom now rose up a cry for the convocation of the States-General. No one clearly knew what they were or how they would work; the last meeting of those august bodies, 173 years back (1614), had broken up in confusion; of the organization, procedure, and powers of the Estates no one could speak with certainty. Nevertheless, at the moment they seemed to offer hopes of a solution of pressing difficulties; and at last the king, with much reluctance, promised that they should be called together within five years.

The cry for the States-General.

The parliament was then recalled to Paris; and the king held a "royal sitting," a different thing from the offensive *lit de justice*, and expounded to the lawyers his views as to the position of affairs. Ominous were his words, for they proved that he had no insight into the great questions seething, and that he clung in a dull and obstinate way to the traditions of the ancient monarchy. He showed France that he meaut to deal in a narrow and hostile spirit with the States-General, and that he reserved to himself in all matters the ultimate decision. Lastly, he offered for their registratiou two edicts, framed, one might think, specially to affront his hearers,—the first (in opposition to the previous declaration of the parliament) authorizing loans to the frightful amount of 420,000,000 livres (£16,800,000); the other ordering the restoration of Protestants to their civil rights. Then the duke of Orleans, great-grandson of the regent Philip, protested, and the parliament, encouraged by his example, declared that the edicts had been registered by force. Orleans was exiled; and the ferment in Paris and through France became extreme.

Court and Parliament of Paris.

The struggle between court and parliament grew bitter; the parliament declared *lettres de cachet* to be illegal, and affirmed that the queen's influence was the cause of the present evils. The court-party in rejoinder proposed to establish a plenary court for the registration of edicts. The parliament protested, and posed itself as defender of the liberties of France. They were forthwith shorn of much of their power, and their function of registration taken away. The local parliaments, throughout France, were treated in like manner, and it is from this circumstance that one of the most tremendous organizations of the Revolution took its rise. Remonstrants travelled up to Paris from different centres,—among others from the Breton parliament of Rennes,—to protest against the high-handed action of the court. The Bretons formed themselves into a club, which, having headquarters in the old Jacobin convent in the St. Honoré street, soon changed its name from the Breton Club to the Jacobin Club, and became the home of the most advanced republicanism.

The Jacobin Club.

Things now went even worse. The old *pacte de famine*, which the humanity of the king had kept down, again began its baleful operations; the disorders of finance went on; there was no money with which to carry on the government. Brienne, at last driven to despair, induced the king, in spite of the queen's strong opposition, to convoke the States-General for the 5th May, 1789. Soon after this, unable to face the difficulties of finance, and having tried in vain a kind of concealed bankruptcy, he gave way and sent in his resignation. Necker was recalled. The winter of 1788–1789 was terrible—especially in Paris; and all France was excited by distress and hope. The capital swarmed with incomers from the country districts round; ever since the great hailstorm of July, 1788, when the crops ripe for the sickle had been destroyed in all the best corn-growing district of France, the district round Paris, crowds of desperate country folk had been pressing in. "All this mass floats about Paris," says M. Taine, "is engulfed therein, as in a great sewer, the honest poor and the criminal alike; some seek work, some beg, all prowl about, a prey to hunger and the rumors of the streets. The officials note that a large number of sinister-looking men pass the barriers inwards." . . . "The general aspect of the mob changes; it contains now a quantity of strangers from all parts of the country, mostly in rags, armed with great sticks, whose very look is menacing." "Vagabonds, ragged fellows, many almost naked, with appalling faces—beings one does not remember to have seen by daylight,—a frightful physiognomy, a hideous attire." Such is the impression left by the crowd of refugees and others who swarmed in the lower districts of Paris; this is the rough material out of which the Parisian and decisive element in the Revolution will be made. The Government thought little of this for the time; the States-General were to meet not in Paris but at Versailles, under the shadow of the monarchy; Paris, long neglected and disliked by the kings of France, was left out of their calculations at this moment.

Distress in Paris.

1789.

IV. The Revolution.

We are come to the verge of the French Revolution, which surpasses all other revolutions the world has seen in its completeness, the largeness of its theatre, the long preparation for it, the enunciation by it of new points of view in politics, its swift degradation into imperialism, its influence on the modern history of Europe. It has been truly said that France had for centuries been preparing for it, for centuries she would feel the effects of it. The imperialism, which has traversed and marred its due development, has perhaps already passed away—its destructive work is over; the republic under which France now lives may be the turning point of European history.

The French Revolution.

For all revolutions there are needed first a favorable concurrence of external circumstances, —such as, in France, the character of Louis XVI. succeeding after his grandfather, the anti-national temper of his court, the outbreak of the American War of Liberation, the ferment of modern ideas in all the countries of Europe. Next, there must be a "semen martyrum," a faith of internal conviction which will strengthen men to face death for their cause, because their minds are lifted above common life and its trivial affairs; this, too, existed in France, and cannot be underrated as a motive power. Sometimes partial and narrow, yet always generous and warm, was the enthusiasm of younger France for the "principles of '89:" the equality of all men before the law and for the burdens of citizenship, the excellence of virtue, the sovereignty of the people, obedience to the law, the blessings of freedom of person, press, and belief, —these and the like, afterwards embodied in the *Déclaration des droits de l'homme*, were great engines which set the Revolution moving, and directed its general course. Joined with these ideas, which cannot reach down to all, there must be a general feeling of misery, oppression, wrong. This the scandals of finance administration, the despair of frequent famines, the grievous incidence of the *corvée* and other ancient services, the inability to get away from the soil or to rise, largely supplied. Moreover, the divergence of classes, which in France had long been increasing, was such as to endanger in itself the stability of society. The older creeds, too, were dying down into their embers, and had lost the power to arouse enthusiasm; while the ancient framework of long worn-out institutions still encumbered all the land, and with their dead weight pressed men down. Selfishness above, hypocrisy in faith, misery below,—these things demanded vocal leaders for attack, and the leaders were not wanting—they were first the great writers, and afterwards the chiefs whom the violence of the time threw to the surface.

Causes of revolution.

Europe had long been uneasy; the "benevolent despots" had tried their utmost for the people and against privilege; enlightened ministers seemed to themselves to be carrying out the principles of Richelieu; they fought against custom and institutions, irritating, weakening, even reversing them. And yet in all they scarcely recognized the existence of Democracy, of a people which would be heard, and would take the foremost place in the rearrangement of Europe. While the monarchs who said of their business with Joseph II., "*C'est d'être royaliste*," were levelling privilege or church immunities, dismissing parliaments or exiling Jesuits with a view to raising their own authority, they little knew that they themselves were in danger. For the new democracy changed the centre and place of sovereignty, and while, as De Tocqueville says, "it swept away the feudal institutions and replaced them with a social and political order more uniform and simple, and based on the equality of the condition of all," it was also sure profoundly to modify the views of Europe as to the position of the monarch, as to the headship and sovereignty in a nation. And the great

The claims of democracy.

1789. change began in France, not because she was more, but partly because she was less oppressed than her neighbors. In comparison with the German, the French peasant had many advantages,—there was less serfage, there were more peasant proprietors. "This," said Arthur Young in 1788, "is the mildest government of any considerable country in Europe, our own excepted." This milder state of things made men more capable of indignation against the injustice they could feel; the most crushed do not feel the most; they are helpless, ignorant; but when men have begun to rise and to understand, then they grow dangerous to their masters. The very attempts made by benevolence in high place to succor the misery of the people roused their anger against their lords,—a point to which De Tocqueville dedicates a whole chapter, entitled "Comment on souleva le peuple en voulant le soulager." In addition to this we must remember that the Revolution found much to forward it in the brightness of the French temperament. The simple principles it preached, with accompanying appeals to virtue and patriotism, at once commended themselves to a people fearfully ignorant, yet unusually intelligent and lively. In their strength and their weakness alike the French people were singularly well fitted to be the heralds of the new conditions of political life in Europe.

The States-General of 1789.

Early in 1789 all France was busy with the elections to the States-General, and in drawing up the *cahiers*, or papers of grievances. From the moment of the king's edict (8th August, 1788), convoking the States-General, discussions had gone on with growing eagerness as to their proper constitution and form. Some urged the pattern of the English constitution; others wished for the forms of 1614; others pointed out the increased importance of the third Estate in numbers and wealth. It was seen that the Estate which in fact would be called on to pay almost the whole sum to be raised must have greater strength than the precedent of 1614 could give it. Bankruptcy stared the court in the face; the king only called the Estates together because the finances were in a frightful condition; he openly sets this forward as the chief reason for their convocation. A demand accordingly arose for two things:—first, that the third Estate should be composed of as many members as the other two orders combined; secondly, that the three orders should debate and vote by head, in one chamber. It was urged on this hand that thus only could those defend themselves who would have to pay the taxes; on the other hand, that to sit in one chamber would be a dangerous innovation, and that a majority of the third Estate would set the unprivileged public above the privileged few. The parliament of Paris, with its lawyer-like preference for precedent over justice, and its incapacity to discern the real issues before it, warmly supported the latter view, and urged the king to follow the rules of 1614. The popularity they had up to that time rather undeservedly enjoyed was destroyed in a moment; it was seen now that the lawyers were as earnest for privilege as the rest. A convocation of notables, chiefly members of the privileged orders, to rule the form of procedure, in spite of Necker's efforts, supported the views of the parliament. The matter grew warm; the princes of the blood, Artois and Condé and the others, who had supported the queen in all her follies, added their remonstrances in the same direction; the popular ferment spread all the more, and Necker became the idol of the people. By his influence the king was induced at last to issue an edict to the effect that there should be in all full a thousand deputies to the States-General, made up in proportion to the population, and that there should be as many deputies of the third Estate as of the other two combined. As to the one-chamber question the decree was silent. In former States-General the third Estate had usually sent more than either of the others; in those of 1560 the third Estate had much exceeded the other two combined, so that this great concession was little more than a continuance of ancient use. It was also decided that the election should be by a double process. The electors, in number about three millions, were limited by no property qualification; it was a kind of simple household suffrage in the country districts, each 200 hearths choosing two representatives, and so on; in the towns two delegates for each 100 inhabitants, and so on upwards,—so that the towns chose twice as many primary delegates as the country districts did for their numbers. These delegates from bailiwicks and towns were empowered to meet in the chief town of each province, there to draw up their *cahiers*, and to choose from their own body the persons who should proceed with the grievances in hand to Versailles as members of the third Estate. 1789.

The manner of election.

The elections to the first Estate, the clergy, returned 291 members,—48 archbishops and bishops, 35 abbés and canons, 208 parish priests; these latter were largely in favor of liberty, and when the time came supported the third Estate in its struggle, while the bishops and higher clergy mostly went with the privileged orders. The second Estate, the noblesse, returned in all 270 persons, one prince of the blood, 28 magistrates, 241 "gentlemen" or holders of noble fiefs. The smallness of their total is due to the proud abstention of the Breton nobles. There were among them a few who sympathized with the popular movement,—at their head the duke of Orleans. The third Estate was composed of 557 members, nearly half of them barristers, and almost all united in defence of the country against privilege. The *cahiers* of all the orders, the third no less than the others, breathed a very moderate spirit. Almost all spoke warmly and hopefully of the king,—all expressed respect for the royal power. The *cahiers* of the nobles urged the interests of their order without hesitation; those of the clergy desired the bettering of the condition of parish priests; those of the third order insisted on the abolition of the unequal rights and services, which were felt throughout France to be a great grievance and hinderance to the well-being of the country.

The numbers of the Estates.

The treatment of the third Estate.

When the three Estates met at Versailles, it was seen that the points at issue were not easily to be settled. The action of the king and his ministers was exceedingly foolish and weak; instead of taking a vigorous line with the question of the vote by head or by Estate, they lingered over trivial questions as to order and etiquette, which could only irritate the "representatives of the people," as men now began to call the third Estate. They must kneel to present their *cahiers;* when they met they must enter through a back door, while the others entered through the main gateway and stood in the royal presence. In a number of petty matters the court seemed determined to remind them that they were inferior to those with whom they sat, while they, in the language of the Abbé Sieyès, felt that "the third Estate was the nation, less the privileged orders." The folly of this treatment strengthened their hands, as did also the blunder of providing no separate hall for them to sit in. After the opening session, when all met the king, they installed themselves in the great Hall of the Estates, and so took possession of the ground they were only too eager to occupy. The verification of powers was the first step to be taken. They urged at once that the three orders ought to verify together, sent invitations to the other orders, which verified separately, and set to work at their deliberations. The third Estate waited, refusing to proceed till they had solved the main question. Meanwhile the court upbraided them for wasting precious time; it became daily clearer that all their masters cared for was that they should arrange for the payment of the deficit and be gone; and then after some delay, they began to verify, taking on themselves to call the roll of all three orders. At the first call no response was made by either noble or clergyman; at the second three curés answered, and were received with enthusiasm; after a short time as many as 100 members of the clergy joined them. They named themselves "the National Assembly" (17th June, 1789), and issued a declaration that the creditors of the state were guaranteed by the honor and loyalty of the French nation; that if they were dissolved, taxation levied thereafter would be illegal; that a committee should be named to inquire into the general distress. Then the clergy, by a small majority, agreed to join the third Estate, and did so; Necker thereon advised the king to yield the point of separate chambers, and to "deign to resign himself to the English constitution," a phrase singularly indicative of Necker's temper and views, and just as inapplicable to the real state of the case. The king, however, would not yield. Though Necker knew, and the king should have known, that the army could not be trusted against the Assembly, he committed himself once more to stupid and irritating tactics. The great hall was closed against the representatives, and they adjourned to the neighboring tennis court,

The National Assembly.

The king's want of wisdom.

1789. where they took solemn oath (20 June, 1789) that they would not separate till "the constitution of the kingdom had been established and confirmed on solid foundations." Under this oath the Assembly claimed a new name, that of the Constituent Assembly,—the Assembly charged to create a new constitution. The king showed utter want of discretion: he annoyed the moderate party in the chamber, who were headed by Count Mirabeau, by refusing to give them any insight into his plans and policy; he alienated any support he had within the Assembly, because he regarded it as a usurping body, insulting to him by its claim of permanence and authority. Next, the Assembly was told that the tennis court was wanted by the count of Artois—the most unlucky of all the supporters of the queen's policy, the most offensive to the people. Once more treated by the court with contempt, because it could not venture to use violence, the Assembly next met in the church of St. Louis at Versailles on the 22d of June. On the 23d they were summoned to a "royal sitting" of all the orders, in which the king lamented the conduct of the commons, and declared the concessions he would grant. The representatives of the people, who had been treated with the scantiest courtesy that morning, received the discourse in silence—a silence deep and anxious, especially when Louis XVI. told them, speaking as an angry master to disobedient servants, that the orders should not act together, but should meet next day in their separate chambers. When he rose to go, he was followed by most of the nobles, the bishops, and some clergy; the third Estate and a large proportion of the parish priests remained, and sent a message to the king to say that they would only retire if forced to do so by the bayonet. Necker, feeling that the king was completely committed, now resigned. The duke of Orleans, with 46 of the nobles, joined the Assembly; after that, force being out of the question, Louis XVI. was obliged to tell the remainder of the noble order to join the others. And thus by June 27, 1789, the orders had all accepted the victory of the commons. The king now threw himself entirely into the hands of the court; Necker's resignation was accepted; attempts were made to get regiments that could be trusted to Versailles; the Swiss and German troops seemed the mainstay of the monarchy. On Monday, 12th July, it came to a collision between the troops and the people. In dispersing a "Necker procession," an enthusiastic unarmed crowd following a bust of the ejected minister, Prince Lambesc, acting under Baron Besenval's orders, fired on the people. A French guard chanced to be among the killed; thereon the whole guard sprang into revolt; the old municipality of Paris, the ancient provost and échevins, who were royal nominees, were swept away; a new provisional municipality arose, and a new Parisian militia. The tricolor flag sprang into existence,—red and blue, the old colors of Paris, with white, the significant ground work of the new constitution. The troops cantoned on the Champ de Mars were now powerless against Paris, which had taken the lead in insurrection and incipient revolution; while the Assembly at Versailles was surrounded by foreign troops, and in danger of forcible dispersal. Paris quickly consolidated her movement. On the 14th of July the new civic guard seized the arms at the Invalides, and on the same day took place the assault on the Bastille. The troops at the Champ de Mars could not be trusted; Besenval drew them back to Versailles. The fall of the Bastille was sullied with broken promises and unnecessary bloodshed; for now the fierce passions of civil war began to move, and the Paris mob had in it desperate and savage elements. The Bastille was levelled to the ground; it symbolized the overthrow of the ancient and worn-out institutions of the monarchy.

The Constituent Assembly.

First collision with the people.

The tricolor.

Fall of the Bastille.

Then the king again appeared in the Assembly, declared that he would remove his troops from Paris and Versailles, and appealed to the fidelity of the Estates. Paris grew calm at once; Bailly was made mayor, and Lafayette commander of the civic forces. Louis XVI. went further still; he visited the capital (17th July) and appeared with the tricolor cockade on his breast. The Parisians welcomed him with enthusiasm, and a happy reconciliation seemed to have taken place. The party of Philip of Orleans sank into the background. Unfortunately for the monarchy, the queen would not loyally accept the situation. Louis XVI. might have become a constitutional sovereign—a first *roi des Français;* his court made it impossible for him. On the very night before his visit to the Hôtel de Ville the emigration of dissatisfied nobles began, and the plans of the court-party at once changed form; from plans they became plots. The queen stayed behind, for she was fearless in disposition and loyal to the king. She only succeeded in involving him with herself in utter ruin. 1789.

Louis XVI. in Paris.

By the 22d of July the first stage of the Revolution was complete. The events of Paris and Versailles found response throughout France; national guards were organized everywhere; the nobles, attacked by the peasantry, made for the frontiers; some laid down their privileges, and hoped to stay in France. The Assembly, backed by Paris, had all power in its hands; the king had to recall Necker, whose vanity and shallowness were not yet found out.

On the 4th of August the Assembly got to work at its business, the framing of a new constitution. With so few solid institutions as France had, with not one true constitutional tradition, with passions aroused and great underhand opposition at court,—it is a marvel that so much was achieved. Privilege was at once abolished, the last relics of feudal use swept clean away; nobles, clergy, the *pays d'états*, cities which enjoyed local liberties and advantages, all laid down their characteristic and special privileges, and begged to be absorbed in the equality of one general French citizenship. Equality is the prominent feature of the Revolution epoch; it overshadows at this moment both liberty and fraternity. The practical carrying out of the principles of equality was not so easy; many who laid down their privilege in words, clung to it in fact; it caused ugly scenes in the country; and the feudal burdens were in some places hardly removed till the very end of 1790. The Assembly next declared the king to be "the restorer of French liberties," and offended him, on the other hand, by reducing his hunting-rights to those of an ordinary landowner. The king's *capitaineries*, a circuit of some 40 to 50 miles round Paris which had been felt to be very mischievous to agriculture, and connected only too closely with the famines of Paris, were much curtailed. When these things were laid before the king, it was seen that his heart was not with the Assembly; on technical grounds he refused to sanction them. Then the Assembly advanced to the consideration of a great declaration of the rights of man—a general statement of the principles and bases of civil society. Carlyle sneers at the resulting document:—rights, yes, but duties, where are they? and what reference is there to might? Still, it is clear that, had the Assembly not occupied itself with this reasonable and logical statement, its enemies could at once have accused it of haste and inconsequence, of passion and pure love of destruction. As a fact, the Declaration of the Rights of Man ranks, as Madame de Staël says, side by side with the English Bill of Rights and the American Declaration. This last was addressed to a people happily quite ignorant of all feudal questions, while the English Bill of Rights dealt solely with practical matters, assuming the main principles of constitutional life to be known, whereas the French Declaration had to begin a fresh epoch—to appeal to a people shaking themselves free from absolutism and feudal oppressions, to affirm the first principles of civil life, to give practical expression to opinions floating in every mind. To us the Declaration reads like a string of political commonplaces; we are familiar with the whole row. To the French it was very different, for they were beginning a new life, and scarcely knew where to tread.

Constitution-making.

The declaration of the rights of man.

This charter of the Revolution is in substance as follows. (1) All men are born and continue free and equal in rights; social distinctions are purely conventional. (2) Society is an association of men to preserve the natural rights of men. (3) Sovereignty resides in the nation; all authority, vested in an individual or a body of men, comes expressly from the nation. (4) Liberty is the power of doing what we will, so long as it does not injure another; the only limits of each man's natural right are such as secure the same rights to others; these limits are determinable only by the law. (5) The law can forbid only such actions as are mischievous to society; "Quod lex non vetat, permittit." (6) Law is the expression of the general will; all citizens have a right to take part

The clauses of the declaration.

1789. through their representatives, in the making of the laws; law must be equal for all; all citizens have equal rights (according to their fitness) to fulfil all offices in the state. (7) Accusation, arrest, detention, can only be in accordance with the law, which all are bound to obey. (8) The law must be reasonable; it must not have any retroactive force. (9) Every one is to be deemed innocent till he has been convicted; persons under arrest on suspicion must therefore be treated gently. (10) All men are free to hold what religious views they will, provided they are not subversive of public order. (11) Freedom of speech, of writing and printing (save in cases reserved by the law), is one of the most precious of the rights of man. (12) A public force is needed to guarantee the rights of man; such a force is for the benefit of all, not of its own class. (13) To support such force a common contribution is necessary; it is to be equally laid on all citizens according to their means. (14) All citizens have a right to show (personally or by representatives) that such public contribution is necessary, to consent thereto, to arrange its application, its incidence, its manner of ingathering, its duration. (15) Society has a right to demand from every public servant an account of his administration. (16) A society, the rights of which are not assured, the power of which not definitely distributed, has no constitution. (17) Property being an inviolable and sacred right, no one can be deprived of it, save when public necessity, legally established, evidently demands it, and then only with the condition of a just and previously determined indemnity.

The declaration acted on.

Having laid down these principles, the Assembly went on to abolish such institutions as offended against the liberty and equality of the rights of man. "Nobility, peerage, hereditary distinctions, distinctions of orders, feudal régime, patrimonial justice, titles, denominatives or prerogatives thence derived, orders of chivalry, corporations, etc., which required proof of nobility or presupposed distinctions of birth," were all declared to be swept away, such distinctions alone remaining as belonged to public functionaries in discharge of their duties. Venality or hereditary succession in offices was also abolished; all Frenchmen in all parts of the country should have equal and common rights; no guilds or corporations should remain; nor would the law recognize any religious vows or other engagements which might militate against either natural rights or the constitution. Such, from end to end, is the Declaration of the Rights of Man. Equality of all men, abolition of feudal privilege, inclusion of the monarchy under the control of the sovereign people —these are the chief principles involved in it; out of these the Revolution grew. In itself the Declaration was not subversive of monarchy; only the French monarch, with two centuries of Bourbon tradition behind him, could not stoop to take a new position in France; Louis XVI. could not become a constitutional king. The Assembly also framed its new constitution, according to the promise of its oath of the tennis court. A limited monarchy, without an absolute veto, and a single chamber having alone the right of initiation of laws, formed the chief elements of it,—the nation to order, the king to execute. "The Revolution from its social side attacked the aristocracy," says La Vallée, "from its political side it attacked the monarchy;" and the single chamber, with a royal suspensive veto which might be overruled in time, seemed to the French people best and simplest. The great danger of the Revolution lay in its simplicity; everything was to begin from a pure white basis; there should be no checks or counterpoises; all should be consecutive, logical. The ambitions, vices, prejudices of men were regarded as nothing; the nation, not even educated as yet, was thought fit to be trusted with absolute power. It is indicative of the ferment and the ignorance even of Paris that the very name of veto aroused vehement disturbances; the royal veto was in their eyes the old régime restored.

The constitution.

The excitement of Paris grew; famine reigned; distrust and irritation followed. It was seen that the royal family were surrounding themselves with troops ill-affected towards the Revolution, and with a great number of devoted officers. Rumors flew through the town; plans of vengeance were supposed, communications with foreign powers and emigrant nobles. The king's reception of the Declaration of the Rights of Man had been cold and partial; the new journals of the time threatened fresh disturbances. At this moment (3d October, 1789,) the amazing folly of Versailles showed itself in a great banquet given to the soldiers, in which royalist songs, white cockades, ladies' smiles, and plenty of food goaded the hungry "patriots" of Paris to madness. A vast crowd, chiefly of women, with the national guard, headed unwillingly enough by Lafayette, streamed out of the gates, and marched to Versailles, insulted the Assembly then sitting, and swarmed round the palace gates. When the king came back from his hunting,—his one solace in these difficult days,—he spoke them fair; but a struggle having begun, in which some blood was shed, he became in fact their prisoner. In an interview with Lafayette, he showed his wonted obstinacy, and practically refused to send away his Swiss guards. Things became very threatening, and Louis at last consented to go to Paris. The queen and the dauphin refused to leave his side; a deputation of 100 members of the Assembly also accompanied him.

1789-1790

The Versailles banquet.

Thus Paris at one blow gained the ascendant over both king and Assembly, and the Revolution entered at once on a new phase. Changes will become easier, the seat of government and movement being narrowed to one city. The vehement eagerness for discussion of political questions, already so prominent a feature of the time, will increase greatly; crowds will frequent the meetings of the Assembly, interfere with its discussions, sway its fears and wishes. "There is a gallery," says Arthur Young, an eye-witness (12th January, 1790), "at each end of the saloon, which is open to all the world. . . . The audience in these galleries are very noisy; they clap when anything pleases them, and they have been known to hiss—an indecorum which is utterly destructive of freedom of debate." The press became more active than ever, with countless pamphlets on the questions of the day; and lastly, the influence of the clubs, especially of that of the "Friends of the Constitution," the Jacobins Club, now began to take the chief direction of affairs for the more thorough revolutionists. With its affiliated clubs throughout France, it formed an all-powerful confederacy, and became the rival of the Assembly itself. The virtual imprisonment of the royal family at the Tuileries frightened the royalist gentry; a second and more numerous emigration now took place. Suspicion and distrust reigned; all held their breath, and thought they felt beneath them the muffled mining of some plot. Royalists accused the ambitious and unsteady Philip of Orleans of making disturbances for his own purposes in Paris; republicans felt sure that the queen and her party were plotting the overthrow of the new order of things with the emigrants and her German relations. The duke of Orleans, a silly and stupid giggler, as Arthur Young found him, was driven by Lafayette to take refuge in England. The two chief parties of the Assembly, the Right and the Left, represented those who hoped, as Mirabeau did or Lafayette, to secure a modified and constitutional monarchy in France, and those who desired to see a republic. Independent of these, who were intent on the framing of the constitution, was the court party, which hoped to restore things to their ancient form, and to bring back the monarchy and the system of the past.

The triumph of Paris.

The Jacobins Club.

The emigration.

The Assembly now set itself to frame the constitution,—the task to which it had solemnly dedicated itself. In France herself there were no precedents to go on, no healthy institutions to be worked in. The clergy were powerless; the nobles, who might have modified and influenced matters, were contemptuous and careless. Arthur Young specially notices their flippant treatment of the crisis they were in; they did not really believe that the new order of things could last, and even expected a counter-revolution. Some of them thought that by pushing the innovators onward they would secure an earlier reaction; doing so, they worked their own ruin and the king's death. The active leaders of the Assembly had then no help at home; they spurned the example of the English constitution, which was often urged on them, for they considered it with truth far too monarchical and far too aristocratic for their principles. It was then almost from a "tabula rasa" that they had to start,—without institutions to use, without experience to warn, or examples to guide them. They were sincere, and knew their own minds, fearlessly pushing the principles they held to their results. Their first achievement was to carry out

The making of the constitution.

1790. the Declaration of the Rights of Man in territorial matters, by totally rearranging the soil of France. They would consolidate and centralize, and show that unity pervaded all. With this end in view they swept away all the ancient historic provinces, which one misses so much on the map of France. No more duchies and counties, *pays d'états* and *pays d'élection;* no local rights or specialties were preserved; the local parliaments were swept off, the local administrations abolished; the very names of Breton or Provençal, it was hoped, would be absorbed in the greater name of Frenchmen. Instead of the old divisions, the country was distributed into 83 portions, as nearly as might be of one size, and these were named departments; each department was subdivided into districts, and each district into cantons or communes. This done, the political structure was at once begun in accordance with it: each department should have a council of thirty-six members and an executive directory of five; the districts similarly should have officers, subordinated to those of the department; the communes also, in like wise, under the districts. Then came the distinction between *active* and *passive* citizenship, as a basc for the franchise. Active citizens, who paid taxes equivalent to three days' labor and upwards, alone had a vote; there was a higher property-qualification for the electors whom they had to choose. The passive citizens were excluded from all share of power. The electors were charged to choose deputies for the National Assembly, administrators of departments, districts, and communes, and eventually judges, bishops, and parish priests. The judicial system was entirely recast. In place of the local parliaments there were to be three orders of tribunals,—cantonal, district, and departmental; and above all, at Paris, a great supreme court. The system of trial by jury was introduced for criminal cases. The National Assembly should be the fountain of legislation, should be permanent, and of one chamber only; it should be renewed by biennial elections. Its number should be 745, distributed among departments according to the proportions of land, of population, and of taxation. The Assembly also laid down a definition of the citizenship, and marked out the position of the king. It next considered the state of the finances; for now, even as under the old régime, France was threatened with imminent bankruptcy. Loans were not taken up, taxes fell short, patriotic contributions ran dry. In this great peril, Talleyrand-Perigord, bishop of Autun, proposed to apply the lands of the clergy for the purpose of meeting the deficiency. The committee of finance declared by his voice that the clergy were not proprietors but administrators only, and that the nation could take on itself the expenses of public worship, and resume its ownership of the lands of the church. In spite of the vigorous resistance of the clergy, and their offer to make a gratuitous gift of part of their lands, the Assembly adopted the proposal, and ordered the sale of the ecclesiastical domains. The argument that these lands were part of the absolute property of the Church Catholic in general, and not of the French clergy in particular, was too unpatriotic to be listened to. The sale, however, was a failure; men were too much frightened by the rapid movement of affairs to feel much confidence, and things again seemed to be at a stand-still. Then the Paris commune hit on a plan which succeeded. The municipalities throughout France were authorized to buy these lands from the state, and to sell them again to private purchasers; and the municipalities might pay for them in bonds, or *assignats* as they were called, based on the actual value of the land. It was ordered that the issue of assignats should be limited, and that they should be extinguished as the lands passed into private hands, and hard money was given for them. The measure brought instant relief to the Government, and the assignats, as has been said, "saved the Revolution." Then followed the "civil constitution of the clergy," in which the state made a great step in the direction often since taken with more or less success,—the direction of controlling the spiritual powers. The Assembly began by affirming the constitution to be based on Christianity, while it refused to admit a state-religion, abolished monastic vows, religious orders, and confraternities, with exception of some useful ones. It then, following the impulse of uniformity given by the new partition of the soil into departments, rearranged the ecclesiastical divisions on the same basis,—a bishop to each department, and so on. The influence of the Jansenists among the clergy in the Assembly was felt in all this; it is their last appearance in French history; after 1790 their name hardly ever occurs again. It was clear that the upper clergy and the bulk of the lower would resist this proposal. If the state severed the ancient relations between the church and itself, it must, to a large extent, leave the church to manage its own affairs. As it was, the state had laid hands on church lands, had declared against the connection, and yet was determined to rearrange the spiritual domain. Finding strong opposition, the Assembly next ordered the clergy to take an oath of obedience to the civil constitution. This, however moderate as it was in itself, involved an acknowledgment of the authority of the state, which in fact prejudged the whole question; consequently, fully five-sixths of the clergy refused the oath, and they with their flocks were still a very considerable power in France. The result was that the interference of the Assembly in church matters broke up parties very much, and threw the power almost entirely into the hands of the non-religious sections of the body. The sight of the church in rebellion, the contempt and aversion with which the priests who took the oath were regarded, put religion into definite opposition to the Revolution; though Jansenists and Huguenots were warmly attached to the new order of things, their influence was weak. Henceforward, in the mind of France, Christianity was regarded as identical with reaction.

1790.

The end of the Jansenists.

The lawyers and the clergymen had thus been dealt with; it remained to abolish nobility. "The lawyers had caused agitation in the country; the clergy had kindled civil war; the nobles were now about to produce foreign wars." The decree of June 19, 1790, swept away the last distinctions of feudal origin, and the nobles and bishops deemed themselves no longer bound by any ties to the new order of things. They did all they could to push matters to excess, with terrible results to themselves. As the nobles alone officered all the regiments of the army, they had great power in their hands. The gulf between them and the privates, the scandals of mismanagement, the spread of revolutionary opinions in the ranks, after a time rectified the evil, and the army before long became the chief support of the new republic. In August, 1790, a kind of struggle went on; in many places the regiments chose officers from among themselves, and turned out their noble masters; in other places they accused the officers of plundering the military chests,—an accusation in some cases only too well founded. At Nancy, under Bouillé's orders, a revolt of three regiments on this ground led to a terrible battle in the streets, in which the regiments and citizens were mercilessly crushed by the garrison and national guards of Metz. It was done by command of the Assembly; Paris, however, and the revolutionists generally, sided with the defeated regiments, and the king, the Assembly, and Lafayette all lost ground through it. Up to this time Louis XVI. had shown himself willing to go with the Assembly. For a while he seemed really to wish to be a constitutional monarch; and, till after the fête of July 14, at which he, the Assembly, the national guard, and a crowd of spectators from all France, renewed, in the midst of boundless enthusiasm, the civic oath, all seemed to promise well. The Assembly had voted a liberal civil list; they had treated him with courteous respect; he seemed thoroughly popular. Had he been a man of any real vigor of character, he might have held the movement entirely in his own hands, and have shaped the future constitution of his country, saving it from extreme measures, great excesses, savage civil war, and tremendous efforts to keep off the foreigner. This, however, was not in him; his amiable disposition drew him one way, the traditional belief in his irresponsible and divine right drew him the other; he became undecided; people grew suspicious. Necker, not a strong man, had hitherto been his guide; he had now lost all his popularity, for public opinion had gone far beyond him, and he was not statesman enough either to direct or to assist it. He sent in his resignation (4th September, 1790), and was followed by the rest of the ministers, who were suspected of underhand communications with the *émigrés* at Coblentz. The king was deeply moved at finding a new ministry not of his own choos-

The position of Louis XVI.

1790-1791. ing; and finally, when the Assembly made its attack on the clergy, he ceased to feel a wish to keep terms with the Revolution. It must be stopped, either by combining against it all the moderates with the dissatisfied and alienated classes and their supporters, or by calling in the refugees from abroad with foreign help at their back.

The two courses before Louis XVI.

Between these two plans the king stupidly oscillated, in the end ruining both his friends and himself. Bouillé, Lafayette, the royalist deputies, the moderates in and out of the Assembly, desired the former course; the Austrian queen, the count of Artois, the emigrant nobles, who all lacked real patriotism and were half foreign, desired to be replaced by German bayonets. Louis, before the end of 1790, was in negotiation with almost all the kings of Europe; at the same time the queen, who hated Lafayette, kept the constitutional party at home at arm's length. She hoped to neutralize the movement at home, while she intrigued abroad, by winning Mirabeau, the terrible orator of the Assembly, in its earliest days the fearless champion who did not quail before the king or the king's servant, the revolutionary nobleman whom his own order had cast out; he might retain all his opinions, which were not republican, should be subsidized by the court, and should uphold the throne. The suspicion and watchfulness of the Jacobins Club, and of the extremer party in the Assembly, did not hinder Mirabeau from openly doing his utmost to preserve portions of the royal authority; and when, early in 1791, he felt that he had some hold on the court, he advised the king to escape to Lyons, and there to establish himself as a mediator between the emigrants and the Assembly, to issue a constitution of his own, embodying the main principles of the Revolution, and appealing to the people to support him. In the midst, however, of these schemes, Mirabeau, worn out by his loose living and the excitement of his political life, suddenly fell ill and died, and with him perished all chance of a constitutional monarchy for France. His guiding hand gone, the king thought only how he might escape in safety, and eagerly adopted Bouillé's proposal that he should take refuge under the shelter of his army on the eastern frontier. It was obvious that this step, if successful, would bring him close to the *émigrés* and the German influence; if it failed, would make men regard him as a traitor. It failed. The court got out of Paris (20th June, 1791), and reached Varennes, not far from Verdun; there they were recognized, stopped, and sent back to Paris. Bouillé entered the place a very short time after they had left; found all the streets barred against him, and, comprehending that the game was lost, turned about and fled to the emigrants.

Mirabeau's position.

The king's flight.

The Revolution triumphs.

The Assembly, at once and with calmness, assumed full direction of affairs; no disturbance followed. The king's return was a triumph of the revolutionary spirit, which showed itself all along his route. All firmly believed that his only wish had been to escape to the emigrants and to make open war on France. The clubs and the advanced section of the Assembly gained greatly in strength. Pétion and Robespierre now began their career as republican leaders. The excitement of Paris broke out in open fighting over the great petition of the clubs in the Champ de Mars for the deposition of the king; and Lafayette dispersed the republican crowd with vigorous bloodshed. The Assembly for the moment seemed to win strength by it; the country showed no wish to be rid of their king. The Jacobins had to draw back for a while; the division between Paris and the country, between the bourgeoisie and the bulk of the people, grew plainer; the Jacobins Club was almost deserted by the members of the Assembly; a new club, the Feuillants, was organized out of the more moderate section of the Jacobins, among whom were Lafayette, Bailly, the two Lameths, and others known as the representatives of the party which wished to unite the old monarchy with the new constitution. The old Jacobins became absolutely republican, and, in contempt, called the Feuillants the "Club Monarchique." In these two clubs the new and clean-cut division of the country into monarchists and republicans was plainly to be seen.

The Feuillants Club.

The Assembly was now coming to the end of its labors; before finishing them, it made the grievous blunder of passing a "self-denying ordinance," and decreed that no member of its body should be eligible for the new Assembly to be at once elected, nor should accept any office under the crown. Lafayette and Bailly resigned their offices as general and mayor of Paris; every one of the men who had voted together in the tennis court, who had gained experience and insight into the proposed constitution, and might have worked it successfully, was rigorously excluded. The constitution was then laid before the king; he accepted it at once, and, going to the Assembly (14th September, 1791), swore that he would observe it faithfully. Then, after decreeing a general amnesty for all political crimes and offences, the Assembly (30th September, 1791) closed its critical labors, and declared itself dissolved. As the members passed out of the chamber they held their heads high, in the belief that they had laid the firm foundations of a reasonable and constitutional government. The country welcomed the constitution with delight; a new era was about to begin; the middle classes were all in its favor, and believed that they had the future in their hands. The elections to the new Assembly, which took place before the Constituent dispersed, were loyally made; the middle party seemed to have a great majority; the king accepted the situation fairly. There were no representatives of the old régime in it to irritate men; violent republicans were few; it was thought that all promised well, and that the Legislative Assembly would have a long and peaceful life. The Legislative Assembly met on October 1, 1791; at once it shaped itself into parties, all more or less loyal to the new constitution. The "Extreme Right and the Right" (to the right, that is, of the president's chair) were usually called the Feuillants, were constitutionalists, who represented the burgher interests, and feared the people, and who wished to uphold the king as far as they could. The "Left," the Girondists, was composed of men inclined towards a republic, also of the burgher class chiefly, also all devoted to the constitution as it stood; the "Extreme Left," which sat on the higher benches, and took the nickname of "the Mountain," was composed of popular delegates and representatives of the advanced clubs, with Robespierre as their out-of-doors leader at the Jacobins, and Danton at the Cordeliers Club. The Centre of the Assembly was timid, and wanting in any principle or clearness; it usually voted with the Left. Thus, the more extreme partisans, whether of royalty or republicanism, were not in the Assembly, but worked outside for their objects; it remained to be seen whether the moderate parties would succeed in holding their own. The conventions of Pilnitz (27th August, 1791) had already shown the excluded royalists whither they might look for succor; Leopold of Austria and Frederick William of Prussia had then agreed, in vague terms, that they would invade France unless Louis XVI. were set free, the Assembly dissolved, the emigrants restored to their possessions and dignities. It was a challenge to Revolutionary France, and a temptation to the unstable king. At every step he and his friends blundered; a loyal acceptance of the constitution and the new Assembly seemed impossible; the royalists at home stirred up civil strife, especially through the clergy; abroad they threatened open war. The Assembly, backed by the new department of Paris, an organization given to the capital early in 1791, fought against the former; against the latter stood the army, mostly strong republicans, supported by the sympathy of the people generally, whose anger rose at threats of invasion.

The Pilnitz conventions.

To meet its pressing dangers, the Assembly, in November, 1791, ordered the emigrants to return, on pain of confiscation of their property, and penalty of death. This decree the king at once vetoed, at the same time issuing a strong order to the emigrants to return. They refused to listen, and the popular feeling on the other hand was much excited by his interference in what seemed to be a matter of life and death to them. The Assembly next passed to attack those of the clergy who had not taken the oath, declaring that "refractory" priests should lose their pay, should be forbidden to perform divine service, should be put under surveillance. The king again exercised his veto: and those who supported the Revolution felt that in the two all-important matters—the threat of foreign war from the *émigrés*, and the threat of domestic war from the "refractory" clergy—Louis XVI.

The Assembly and its foes.

The constitution completed.

1791-1792. was against them, and with their enemies. They murmured the word "traitor."

The threat of invasion. After some hesitation the German princes began to show signs of movement; troops were raised by Austria, Prussia, Piedmont; the other monarchs of Europe threatened. France set on foot three armies,—one of the north under Rochambeau, one under Lafayette on the north-east, a third under Luckner on the Rhine as far as to Basel. The Montagnards alone, distrusting the officers and the king, opposed a declaration of war. All France suspected treason, and had only too good reason to think that the king's ministers, excepting Narbonne, minister of war, were in communication with the enemy. The feeling against the ministers was so strong that after the trial of one of them, known to be the queen's agent, they all resigned, and a Girondist cabinet was appointed by the king. Roland, a man of intelligence, spirit, and uprightness, married to the noblest lady of these troubled times,—a lady who was the inspiring genius of the Gironde,—was made minister of the interior. The other name of note was that of Dumouriez, who had the portfolio of foreign affairs. This ministry at once took up a resolute position against the allied sovereigns; and Francis II., the new head of the house of Austria, unlike Leopold, who had never wished for war, at once replied with defiance, ordering France to replace king, clergy, and nobles in their ancient dignities and privileges. On the 20th April, 1792, the Girondist ministry declared war against Francis, and the long wars of the republic and the empire began.

The Girondist ministry.

War declared against Austria.

The French army was in a state of great confusion; most of its officers had joined the emigrants, eager to show the Germans "the way to Paris;" those who remained were suspected by the people; there was little money in the treasury, little experience in the camp. Dumouriez hoped to make a good beginning by invading Belgium, restless under its Austrian masters, and only lately in revolt. All, however, went amiss. One column was checked near Tournay, lost its guns, killed Dillon its general, and fled with cries of "treason;" a second column was defeated near Mons; Lafayette and the other generals hereon halted and stood on the defensive. All France was uneasy. Had her ancient courage departed? was she powerless without her noble officers? or was she the victim of treachery? The Jacobins grew more vehement; the terrible voice of Marat was now heard calling for heads; suspicion became greater than ever against the king, above all against the Austrian queen, and the guards around them, who were thought to be inclined to betray the people. The Assembly declared itself as sitting in permanence. It levelled measures against the refractory priests; it declared that the king's guard should be dismissed, and that a camp of federal soldiers should be formed at Paris. The king refused to dismiss his guards; and on a strong remonstrance from Roland, he at once dismissed the three chief Girondist ministers. Dumouriez, finding the king obstinate, also resigned office. Louis named a ministry of obscure members of the Feuillant party,—men who believed in the constitution of 1790, and in the royal authority. It was at this time that he sent Mallet du Pan on a secret mission to Vienna, to pray the Germans to rescue him from the tyranny of those "who now ruled with a rod of iron."

Campaign in Belgium.

Lafayette's position. The Girondists, thus ejected from power, made common cause with the Jacobins, and watched with keen eyes the course of Lafayette, the centre of the constitutional party; the ministry and all those who in heart loved the older system or dreaded the progress of the Revolution, looked to Lafayette and his army as their only hope. He was no statesman, loyal and upright as he was, and committed the great blunder of defying the Jacobins. At once his waning popularity was lost; his party was seen to be that of reaction; the people could see no difference between the constitutionalist Feuillants and the aristocrat emigrants, and the doom of the party was sealed. On the 20th of June, 1792, the Jacobins replied to Lafayette's manifesto by raising the Parisian populace against the Assembly. That body, overawed and powerless, could do nothing against so fierce and determined an invasion. They next forced their way into the palace, and there Louis XVI. met them with admirable dignity. The populace shouted "down with the veto," "recall the ministers," and so forth. The king wore the Paris red cap, and the crowd was appeased at once. It was an excited, not a bloodthirsty, mob that day. Louis assured them that "he would do whatever the constitution ordained that he should do,"—words which, though they meant little, yet when joined with the red cap and the king's manly bearing, satisfied the people, who departed quietly. Public opinion seemed at once to go with the monarch and the ministers against this outrage; the Girondists, who had been parties to it, lost ground; Lafayette even ventured to come up to Paris from the army to demand the punishment of the insurgent chiefs. His attempt, however, was a failure. The Assembly threatened to arrest him for leaving his troops without orders; the courtiers of the Tuileries looked coldly on him; the king gave him no thanks; as for the queen, she liked him no better than of old. He had to return quickly to the army. The truth was that at this time the court policy had gone entirely over to the emigrants and their foreign friends. There were 80,000 men at Coblentz commanded by the duke of Brunswick; the royalists cared nothing for such constitutionalists as Lafayette; "in a month I shall be free," was the queen's remark.

Insurrection of the 20th of June.

1792.

The court goes over to the emigrants.

Prussia had now also declared against France, and was on the march; this movement restored all power and popularity to the Jacobins. The Assembly took measures in self-defence against the court and the foreigners; men began to call for the deposition of the king; the country was proclaimed in danger, and 50,000 volunteers were decreed; men flocked to enroll themselves from every quarter; the excitement grew daily; the fiercest threats and suggestions made themselves heard. The Jacobins organized, almost openly, a new insurrection, which should force the hand of the Assembly, and "save the Revolution." The vanguard of the attack on the constitution was entrusted to the battalion of men of Marseilles, who have attached their name to the ever-famous song, which has been sung by Frenchmen on so many a hard-won battlefield, in politics or in campaign, the *Marseillaise*. The extravagant proclamation with which Brunswick heralded the opening of his campaign did but add to the fury of people; and on the 10th of August the great insurrection, led by the popular chief Danton, swept over the Assembly and the monarchy, overpowering everything as it passed along. The guards at the Tuileries were of uncertain fidelity to the king; the commissioners of the sections of Paris seized on the Hôtel de Ville, and at once set up an "insurrectionary commune;" they summoned before them the commandant of the national guard, Mandat, who was massacred as he left the hall. The guards, thus left headless, refused to fire on the people; the insurrection swept over all; the king with difficulty, surrounded by his family, took refuge under protection of the trembling Assembly. The Swiss guards of the palace were massacred, the Tuileries taken and sacked; the new municipality, flushed with victory, compelled the Assembly to confirm its powers; to order the election of a new National Convention; to declare the king suspended provisionally, and placed at the Luxembourg under civic guard; to dismiss the ministers; to make into law the decrees passed but vetoed by the king. The Assembly was crushed, the royal family prisoners in the Temple; the Paris people, under inspiration of Robespierre and Danton, were omnipotent. Forthwith began the terrible scenes of the prisons, the mockery of trial, the massacre of the "killers at six francs a day." It was clear that the new commune of Paris was now the sovereign power in France; it established a committee of surveillance, and swept away all the older administration of Paris. Danton, burly representative of popular passions, and of popular kindness also, was the leading spirit of the time. He was no statesman, and had little chance of permanent power, when pitted against the virtuous, the incorruptible Robespierre, who had kept sedulously clear of the insurrection, and was already planning how he might rise by it to the top of his ambition. Danton with all his roughnesses was a man; Robespierre was a vain fop. Danton had comparatively little personal ambition; Robespierre always thought first of himself, and intended to become the dicta-

The *Marseillaise*.

The Paris commune.

Danton.

Robespierre.

1792. Marat. tor of a new commonwealth. Marat, who must be named here, was the leading spirit of the committee of surveillance, the leader and instigator of all the bloodshed of the Reign of Terror. He wished, too, to be dictator, that he might purify society,—that he might have in his power the sole and unquestioned right to slay.

The invasion. Lafayette, in spite of the invasion, would have marched on Paris to save society. He found himself abandoned, and took to flight; the Germans, to whom he went, imprisoned him and treated him ill. Meanwhile, the allies took Longwy and Verdun, while they besieged Thionville; the road to Paris seemed quite free to them. The effect on Paris was terrible; no one knew who was in communication with the foreigners; fear and anger made men brutal; the massacres in the prisons went on incessantly. Danton, "fiercely as he might bellow, was ashamed, for he had a human heart; and he delivered from the fury as many of the victims as he could." Meanwhile, the Prussians had forced their way into France through the Argonne, in spite of Dumouriez; and the duke of Brunswick, who hoped to cut him off, and had abandoned the direct road for Paris through Chalons, was met by Kellermann who lay in his path at Valmy. The spirit which Kellermann infused into his raw troops staggered the assailants, who hesitated and drew back. The cannonade of Valmy, for it was little more, was more to France than many a great victory; the Germans had to fall back discomfited; the siege of Thionville was raised. By the 1st of October not one of them remained in France. Unfortunately, no steps were taken to harass them in the retreat; their state was so bad that a little vigor might have entirely ruined them. Shortly afterwards came news to Paris that the army of Alsace under Custine had taken Worms, Spires, and Mainz, where lay the chief magazines of the allies; in the north an attack on Lille was repulsed. Savoy was occupied by French troops, who also seized on the coast line, and occupied Nice and Villafranca, with its great munitions of war. Abroad the Revolution showed itself proud and defiant; at home the National Convention replaced the Legislative Assembly.

V. The Republic.

The National Convention: parties in it. The new government of France reflected the changes which had taken place. Paris sent the chief Jacobins to it; the Girondists sat on the right and had a large majority; the Jacobins on the left, high up, with the *sobriquet* of the Mountain; below sat the "Plain" and the "Marsh," the timid moderates, who leant towards the Girondists. Paris was behind all, fierce and bloodstained, supporting the Jacobins. At once the Convention decreed (21st September, 1792) the abolition of royalty in France,

Abolition of royalty. and proclaimed the Republic. The 22d of September, 1792, is the "First day of year I. of the Republic." Roland, the most influential of the Girondists, retained office as minister of the interior; and his party, encouraged by the protests of the permanent department of Paris, which felt itself set aside, attacked the anarchy of the capital and the Jacobins. Robespierre was denounced, and great debates ensued; the Girondists, however, in spite of their majority in the Convention, had no force, and little political sagacity. Paris was in no mood for submission to the more moderate and constitutional friends of the republic; before the end of 1792 the commune, and the Mountain with it, had defeated the Gironde, the executive power, and Roland himself. For a time, however, the trial of the

The trial and execution of Louis XVI. king absorbed all attention. It had begun in November, 1792; in December Louis had been questioned by the Convention; all France discussed with vehemence the different views as to the method of the trial. Who should judge him? The parties here split; the Gironde, anxious to gain time, and to save the king from death, and the country from a great blunder, called for an appeal to the sovereign people; they still clung to constitutional forms. The Mountain held that the Convention was competent to undertake the task of an immediate trial. The opinion of the country re-echoed the cries of Paris; and the Convention, on the 15th, 16th, and 17th January, 1793, took on itself to decide the question; by a majority of a few votes (387 against 334) it decreed that the king's punishment should be death. Philip Egalité, his nearest kinsman, was one of those who voted with the majority, to the disgrace of his name; even 1793. those who wished for the king's death despised and condemned him for an act dictated by weak ambition and cowardice. On the 21st of January, 1793, Louis XVI. was executed on the Square of the Revolution.

By this act, as the Montagnards themselves said, "the Revolution threw down the glove to all ancient Europe." They had accused their rivals the Girondists of intriguing to save the monarchy, of coquetting with the emigrants and the foreign sovereigns. The Girondists, in their turn, accused them of being "anarchists sold to the foreigner," men who were treacherously pushing on the Revolution to excess in order to discredit it, and to bring in the foreign help which the court desired; men who were in the pay of Pitt, the supposed Macchiavelli of the time, whose hand was believed to be in everything which could turn to the harm of France. If Henry IV. was the hero of the Revolution, Pitt was its bugbear; Frenchmen were scared in those days by his name, just as twenty years later Englishmen were scared by the name of Napoleon. The truth is that the Girondists represented the burgher classes, and were honestly eager to establish the new constitution in all its parts; they were on the defensive, while the Mountain, the party of offence, represented the suffering populace—eager, defiant, weary of negotiation, suspicious of treason at every point, and zealously determined to push the principles of the Revolution to their limits. In this they were utterly careless of political considerations, eager for war, come what might, quite honest and narrow,—a very dangerous and powerful party. Their victory in the trial and execution of "Louis Capet" was complete; it brought with it inevitably the fall of Roland. When Robespierre and Danton attacked him in the Convention, finding that the Girondists no longer had a majority, he laid with dignity his resignation before the Convention, and was replaced for the time by the indolent and philosophic Garat, the minister of justice. The ascendency of Robespierre

Robespierre's rise. was assured—the man to whom the Revolution, as his enemies said, "was the religion of which he was the priest." "Robespierre preaches, Robespierre censures, thunders against the rich and great, lives simply, has no physical passions, has created for himself a reputation for austerity—the austerity of a saint. He speaks of God and Providence, calls himself the friend of the poor and feeble, is followed by the women and the weak, whose adoration and homage he solemnly accepts." This is the dangerous man in whose hands lay the fortunes of France throughout the dark days of the Terror. He was the prophet who should realize on earth the beautiful and popular dreams of the *Contrat Social*.

Conquest of Belgium. After the withdrawal of the Germans from France at the end of the previous September, Dumouriez had easily persuaded the Executive Council at Paris that, by seizing the moment of amazement and disquiet, the French armies might secure for France her "natural frontiers,"—that is, might become masters of the whole left bank of the Rhine from Basel to the sea. Custine and Kellermann should master the middle Rhine at Coblentz, and Dumouriez should invade Belgium. He set out at once, and on November 6, 1792, by winning the battle of Jemmapes, roused the amazement of all Europe. It is true that the French were two to one, yet so low had their reputation for fighting-power fallen, that the courage they showed on the field took men by surprise. The Austrians fell back, and Dumouriez occupied all Belgium down to the Meuse. The Scheldt, which had been closed since 1648, thanks to the jealousy of England and Holland, was reopened; Antwerp and all Belgium regarded the French as their deliverers, and a Belgian republic, in which the clergy took the lead, was formed at once. Dumouriez, poorly seconded by the other armies, and ill-provided from France, could push the Austrians no further than Aix-la-Chapelle; Custine, who had occupied Frankfort, and thereby forced the German diet to declare war on France, was driven out of that place, and could scarcely hold his own on the Rhine. While France was laying her

Foreign relations of France. hand on monarchy at home, she challenged at the same moment the hostility of Europe, by this conquest of Belgium, and by the declaration of a crusade by the army against all its ancient institutions. The army began henceforth to regard itself as a great republican propaganda; it was by using this belief that Napoleon eventually worked his will on France.

1793. This development of a warlike tendency in the republic, coupled with the fall of the king, decided the policy of England, which hitherto had shown some sympathy with France. The ferment of opinion in England, roused by the revolutionary movement and republican ideas, was much stilled by the news of the death of Louis XVI.; and Pitt with great ability both used the feeling in favor of the Tory Government at home and tempted the French ministers to declare war against England (1st February, 1793). Pitt at once proclaimed it, by a happy phrase, to be "the war of armed opinions," and drew tighter his friendly relations with the European courts. All ancient lines of policy were entirely obliterated by the new phenomenon. Spain and Portugal agreed; Austria ceased to be jealous of Prussia; Russia and Prussia found the moment good for a farther partition of Poland; the only neutral powers remaining in Europe were Sweden and Denmark, Switzerland, Venice, and Turkey. The Mountain did not quail before so great a display of force. "France shall be an armed camp," and every Frenchman a soldier; "conquer or die," the watchword of a united people; the "principles of the Revolution" a new religion for which men of good will should devote themselves. The enthusiasm was great; a levy of 300,000 men was voted at once; the revolutionary propaganda filled Belgium, and alienated the friendly feeling there by its violence. They had also ruined Dumouriez's plans, and he, with an ill-equipped army, and feeling that hostility was rising against him in Paris, set himself to recover ground by a bold attempt to conquer Holland. He was caught by the prince of Coburg at Neerwinden, and defeated after a vehement battle (18th March, 1793). Then, as a last step, Dumouriez came secretly to terms with the Austrians, agreed to evacuate Belgium, and carrying with him the young duke of Chartres, who had shown great gallantry and ability in the face of the enemy, marched for the French frontier, intending to restore the constitution of 1791, to secure the Girondists, overthrow the Jacobins, and proclaim the duke as constitutional king of France. In Paris, the struggle between the parties in the spring of 1793 was acute and close. The news of the disaster of Neerwinden and the march of Dumouriez for Paris aroused all the fury of the Jacobins; the Girondists, with horror, saw themselves innocently implicated in a counter-revolutionary scheme, carried out lightly and suddenly by a general whom they did not trust. The Jacobins at once took the ascendant, proposed the creation of the terrible Committee of Public Safety, summoned Dumouriez to the bar of the Convention, and sent off four deputies and the minister of war to him. When they came he seized them, sent them over the frontier to the Austrians, and openly proclaimed his objects. His regular troops might have supported him; the volunteers, full of Jacobin ideas, rose on him, and compelled him to take refuge, with the Orleans princes and a handful of soldiers, within the Austrian lines. It was clear enough that the Jacobins would assume that he and the princes had had throughout an understanding with the Gironde. The Convention in alarm decreed that its own members should not be inviolable, but might be arrested on suspicion of treason; that the Orleans family should be sent to Marseilles; that three representatives should be sent to look after each army. The Committee of Public Safety was now formed of nine members re-elected monthly, as a secret spring to push the whole machine forwards without being seen. It was an ominous fact that not one of the nine representatives who formed it was a Girondist. They had still a majority in the Convention; it was all they had. Matters moved on fast; Paris, the commune, the ministers, the army, were all against them; in the country they had no adherents in the east and north-east of France; for the nearer Germany the stronger the Jacobin feeling. In the south-east royalist sentiments were still powerful, though for a time concealed. Their headquarters were at Lyons, and violent and bloody disturbances had already occurred there; in the west, in Brittany, Poitou, and Anjou, the royalist feeling was stronger still, and broke out, on the 10th March, 1793, in the terrible Vendean insurrection on behalf of the white flag and the refractory priesthood. The Girondists had their strength in the south-west, with Bordeaux for their headquarters; the Normans and Picards, on the whole, supported the constitution of 1791, and thus could go with the Girondists.

The position of England.

France defies the world.

Dumouriez's plans.

The Committee of Public Safety.

Insurrection in La Vendée.

1793.

At the beginning the Vendeans carried all before them, and in fanatical enthusiasm sullied each advantage they gained by horrible massacres, by shooting their prisoners in cold blood, pillaging towns, burning villages, maltreating the defenceless. The civil war from the beginning took a fierce color—a color given it by the royalists. The Girondists also in the south threatened to march on Paris to put down the Jacobins. The allied powers, however, instead of closing in resolutely on France at her weakest, saved her by their long discussions as to what each of them was to take rather than what each was to undertake. At last they moved forwards in the north; Austrians, Dutchmen, and English, under Cobourg and the duke of York, slowly drove back the army of the north, which unfortunately lost its commander Dampierre, who was skilfully reviving its confidence, and besieged Valenciennes. The king of Prussia blockaded Mainz; in the other scenes of war the French were too weak to do anything, and suffered losses and defeats. The struggle of Girondists and Montagnards went on all the same; it was the gloomiest moment of the history of the Revolution. In May a Committee of Twelve was appointed by the moderate party of the Convention, at the suggestion of Barrère, a moderate who had the confidence of more extreme men. It was composed of Girondists. Over against this move the sections of Paris established their Central Revolutionary Committee. On the 31st of May, guided by Danton, Paris rose against the Convention, and compelled it to suppress the Committee of Twelve. Marat at the head of his sans-culottes, supported by the minority of the representatives, the Mountain, on the 2d of June overthrew the Girondists, arresting two of the ministers and thirty-one deputies. More than half the departments rose to defend the defeated party; in the Cevennes the white flag was unfurled, and the emigrants began to stream back into France. "On the one side was Europe with three-fourths of France; on the other side Paris with a few departments" (La Vallée). The position of things might well have seemed desperate for the Mountain, had there been any strong man, any true head, to direct the attack on them. But they had unity, energy, devotion to their principles, the main part of the army at their back; while their antagonists were divided in views and principles, and were in confusion. Danton, who in fact carried his party through the crisis, showed real power and energy. Under his direction the Convention proclaimed martial law in the hostile departments, called up the army, as far as possible, to the capital, and in eight days constructed a new constitution, that of the year I.—simple, thoroughly democratic. It never was really acted on; men were too busy to care about constitutions. The assassination of Marat by Charlotte Corday, which occurred at this moment, inflamed men's minds still more against the Girondists; she had come from Caen, one of their towns, and was thought to agree with them. The first active measures taken by the Jacobins showed that the Girondists were powerless; Paris and the army were at once triumphant, and by the beginning of August the Girondists were crushed.

1793.

Fall of the Girondists.

Elsewhere things looked very dark: Toulon fell into English hands; La Vendée remained unsubdued, and defeated the incompetent officers sent to reduce it; Mainz and Valenciennes fell; all France was vexed with famine, and the assignat-system had utterly paralyzed commerce. The republic, however, was full of energy. After the fête of the 10th of August, with its statues of Nature and Reason, its classical and pagan affectations, and those light frivolities which were natural to Paris even in the darkest days, men turned at once to the ever-recurring question, how the republic should be saved. The convention decreed a *levée en masse* to resist the invader and to keep down the ill-affected at home; to the Committee of Public Safety was entrusted the real government of the country; the new constitution was not to be introduced till peaceful days came round. The overthrow of all things old was further indicated by the issue, on 24th November, 1793, of the new republican calendar. Year I. was fixed to have begun on the 22d of September, 1792, the date of the proclamation of the Republic. The new year should have twelve months like its predecessors, each with a new name, in four groups

The republican calendar.

1793. of three, each of 30 days, and each divided into three decades, of which the tenth days should be days of rest, in lieu of the old exploded Sunday. These 12 months of 30 days a piece, cutting across the old months so awkwardly, only made up 360 days; so that a little bundle of 5 days (in leap years of 6) had to be tacked on at the end of the Fructidor month (August-September) in an awkward and shapeless way, and called, poor things, the *Sans-culottides*. Such interferences with symmetry will nature cause, when she sets herself against the spirit of system, and the advance of enlightenment. Attempts were also made at this time to grapple with the confusion in the currency and the crushing deficit; the mass of assignats was reduced by more than a half; a maximum price was set on the necessaries of life; trade also had to bow to the will of the Revolution.

War in 1793. In the affairs of war the new life of the Revolution found expression in the vigorous plans of Carnot, an engineer officer, who saw the truth of the principle afterwards acted on by Napoleon, that "God aids the big battalions." "Attack in mass, and cover the want of discipline and skill by numbers and enthusiasm,"—this was the new order. For neglecting this Houchard was deprived of command in the north, and had to give place to Jourdan, who, helped by Carnot himself, defeated Coburg at Wattignies (16th Oct., 1793); on the Rhine the battle of Pirmasens was lost (13th October), and the allies occupied Hagenau and Fort-Vauban; they threatened Landau, and had friends in Strasburg. Hoche was then set down to the army of the Moselle, and Pichegru to that of the Rhine. The former, after a series of rather unsuccessful battles against the duke of Brunswick, in which he failed to relieve Landau, suddenly left his adversary, and, in concert with Pichegru, cleared the Vosges, and brilliantly stormed the Wissemburg lines. The Austrians at the end of the year had raised the siege of Landau, and were across the Rhine; the Prussians took winter-quarters at Mainz; the French lay in the Palatinate. In the south also things went better with the new Government; Lyons and Toulon were retaken, though on the slopes of the Pyrenees the Spaniards forced the French to take refuge under the walls of Perpignan.

Close of the war in La Vendée. In the Vendée the terrible civil war still raged; the peasants, point after point, defeated the isolated columns of the army. A more coherent plan of action, however, gave the victory at Châtillon (16th October, 1793) to the Republicans; then the Vendeans crossed the Loire, and defeated Lechelle near Laval. They next attacked Cherbourg, meaning to make it their point of union with the English; here, however, they were manfully withstood, and, incapable of siege-operations, withdrew. On their return they defeated Rossignol and made a push for Angers, meaning there to recross the Loire to the left bank. Westermann and Kléber drove them thence with loss, and with Marceau pursued them to Le Mans, where, after a terrible battle in the streets, in which no quarter was given or taken, the Vendeans were utterly defeated. Westermann pressed on their heels with pitiless vigor; caught at last between the Loire and the Republicans, they were finally defeated (23d December, 1793). Thenceforward they ceased to be formidable, though still troublesome at times.

So ended 1793, with fortunes, on the whole, very favorable to the French army, and very fatal to the Girondists. Meanwhile, the Reign of Terror had begun at Paris; the queen, the leading Girondists, all who were "aristocrats" or "ci-devants," as the phrases of the day called them, Philip Égalité, and a crowd of others, passed under the guillotine. In La Vendée, the revolutionary fury, goaded by the blood shed by its opponents, spared none it suspected. From Toulon most of the inhabitants had fled for refuge to the English ships; at Lyons the Convention ordered the destruction of the city, and the establishment of a new town to be called "Commune Affranchie;" many hundreds of the citizens were guillotined, and when that process proved too slow, were shot down by platoon fire.

Hebertists and Dantonists. Two parties were now to be discerned in opposition to the rule of the Committee of Public Safety,—the *Exagérés*, or Hebertists, so named from their leader Hebert, the party of terror and reckless bloodshed; and the *Modérés*, the Dantonists, who tried to calm men's minds, and lessen the atrocities of the time. The Hebertists were the stronger party; they abolished the Catholic worship, swept away the past, set up a goddess of Reason, and professed atheism. The party of Robespierre in the Committee disliked both the indulgent and the savage sections. Early in 1794 the Hebertists were seized and condemned to death; it was a first victory of the Government over the violent party. Had Robespierre been willing to ally himself with Danton, a stable rule, at least for a while, would have been possible. But he refused: he was not a person to brook a manly rival at his side; and Danton, with his party, fell victims to the ambition of the ascetic and heartless Robespierre. "If my friend is culpable, I will sacrifice him to the Republic," was his phrase,—had he said "to myself," he would have hit the truth. Then Robespierre became for a while a dictator; all France bowed before him; the revolutionary spirit in the eleven armies on foot was on his side. The campaigns of 1794 proved glorious for them; the battle of Fleurus (26th June) won for them the second conquest of Belgium; in the Pyrenees the French stormed the Spanish camp at Ceret, and threatened Catalonia; in Italy, where young Bonaparte commanded the artillery, they swept the Piedmontese out of their camp at Saorgio, and got the command of all the strong points along the Alps. It was only on the sea that the French armies failed; Corsica was taken, and Howe defeated the squadron in charge of a corn-fleet from San Domingo. 1794.

Robespierre's rule. In the midst of his foreign cares Robespierre also busied himself with the exposition of his ideas. Those whom he had destroyed, Hebertists and Dantonists, had been anarchic and atheist; he, pale reflex of Rousseau, would bring back the reign of virtue and the love of God. He desired to be at once high priest and dictator of a regenerated France. To this end he passed a decree recognizing the Supreme Being and declaring that the soul is immortal. His admirers at once hailed him as a great prophet; the emotion throughout the country was great. On the 8th of June, 1794, he took the lead in the great fête of the Supreme Being, which amused and offended many of his old friends. Finding himself far from being admired by them, he determined that the Terror, which he had in some ways mitigated, should go on again; the Convention, however, resisted, and he withdrew completely from public life, giving his enemies the opportunity of strengthening themselves against him. At the same time he left the reins of power in the hands of his terrible colleagues, who at once applied with the utmost ferocity the law by which suspected persons could be put to death with but the shadow of a trial. This was the time of what is called the Great Terror, June and July, 1794. The reaction soon came; in spite of his friends and the power of the Jacobins, he had arrayed against him the majority of the Committees, and almost all the old Montagnards; his pride and vanity, the fête and his conduct of it, their fears of a dictator, their fear for their own heads, all undermined his position. Before long the struggle began. Robespierre was no Marat; he would not strike a crushing blow, and "making solitude, call it peace." He trusted too much to the strength of his ideas, the influence of his party; and on the 27th of July, 1794 (the 9th Thermidor), it came to an explosion in the Convention. Permanence was voted, the arrest of Robespierre and his chief supporters was agreed to; a proclamation to the people was issued; five members of the Convention were carried off to prison. Instantly, the commune of Paris declared itself in insurrection, the tocsin was rung, and the five deputies were at once rescued from the jailer's hands, and carried in triumph to the Hôtel de Ville. Two hundred cannoniers marched on the Tuileries, where the Convention was sitting, and all seemed over there. But the artillerymen were not firm; when the deputies talked to them, they hesitated, and that hesitation was fatal to Robespierre; for those sections of Paris which hated him had also put themselves in motion to defend the Convention; indecision fell on the Jacobins, their forces melted away, and the resistance came to an end. Robespierre tried to shoot himself, and shattered his lower jaw; he and his friends were again arrested, and perished the next day on the scaffold. And thus ended the early history of the French Revolution. From the proclamation of the Republic to the days of the Legislative Assembly, from the overthrow of their power to the death of the king, thence to the fall of the Girondists, then to the death of Hebert and Danton, now to the failure of Robespierre's bloodstained Utopia—thus had the Revo-

The Great Terror.

Robespierre's fall.

1794-1795. lution moved onwards, violent, yet often generous, proudly patriotic, yet destructive of all the stability of the country. There remained but the army. The army was heartily republican, and had suffered enough and triumphed enough to have a high idea of its own organization and its worth. When a man comes to lead it, the army will set itself to organize France into an instrument of tremendous power; a despotism, solid and strong, aggressive abroad, vigorous at home, using all the terms and calls of the Revolution, will take the place of the ill-fated men who have hitherto tried to guide the destinies of the country. It will call itself an empire; it will be a despot ruling with the liberal ideas and phrases.

The future of the army.

Meanwhile, as Mr. Carlyle says, "here was the end not of Robespierre only, but of the Revolution-system itself," for his death was the signal of a great revulsion of feeling. France, so gay and light of heart, had lived an unnatural life under the preachings of this virtuous dictator; she was weary of the gloom and burden of a system which crushed out gayety, made wealth a crime, and pleasure impossible; and public opinion hailed with joy the tidings that the régime of virtue and the guillotine was over. The Terror was past; the committees which had destroyed Robespierre perished with his death; the "Thermidorians," the Mountain, who had caused this revolution, became a reactionary party, sitting on the right, and remodelling, if not overthrowing, the existing government. The prisons were emptied, the terrible cruelties of Nantes stopped; amnesty was offered to the rebels; the sections of Paris were reduced in importance, the administration of the capital reorganized. All the parties in hiding came forth; the Girondists returned; society began once more to dance and glitter; it was like the temper of England after the return of Charles II. In January, 1795, the Convention closed the Jacobins Club; the agents who had carried out the inhuman orders of the past were put to death.

The reaction on Robespierre's death.

Close of the Jacobins Club.

The armies, which by no means sympathized with the movement of affairs at home, still pursued in the autumn and winter of 1794 a brilliant career under Pichegru in the north, Jourdan on the Sambre and Meuse, and other generals for the Moselle and the Rhine. The whole course of the Rhine from Basel to the sea was in their hands; and the winter campaign, in which Pichegru conquered Holland, raised the fame of the commander and of his troops to the highest point. Pichegru had done what Louis XIV. had failed to do; 1795 wiped out the discredit of 1672; Holland and Belgium were to become republics on the French model; the Amsterdam populace welcomed the French as brethren. The capture of the Dutch fleet at the Texel by hussars, who stormed it on horseback, riding across the ice, seemed to the French people to realize a tale of fairyland. At home, too, the suppression of the Chouans, those Breton peasants who, taking advantage of the troubles, plied the trade of brigands and highway robbers, added to the general content. The Vendeans struggled still; their country was a scene of desolation, and the central authority had to recall their barbarous agents, and to try to reduce the district to peace by way of conciliation.

The war abroad.

So ended the year 1794, which saw the reaction set in at Paris, and saw, too, the Revolution triumphant on every frontier, and the area of its influence extended widely. The coalition against France showed signs of breaking; the Dutch made peace, ceding northern Flanders with other districts to France; the king of Prussia also abandoned the coalition, ceding to France the left bank of the Rhine; the Bourbon king of Spain next abandoned "the cause of all kings;" the little states of Germany followed; Portugal made advances in the same direction, as did Naples, the papacy, and other Italian powers. England and Austria alone stood firm against the new ideas, and Pitt, though he could not hope to direct, or have to pay, half Europe, still felt strong enough to carry on the war.

Things look brighter for France.

Paris, where famine raged unchecked, was still uneasy and dissatisfied with the new Government. Men who knew how to excite the populace to fury told them that the scarcity was factitious; and they broke out into insurrection on the 1st of April, and again on the 20th of May. On each occasion the disturbance was easily put down. The multitude was thus completely overthrown, and the guidance of affairs lay entirely with the middle classes; the reign of wealth and comfort was what men longed for; it was in sharp contrast with the general distress and suffering of the people, and provoked vain contests and bloodshed. The royalists thought that their time was come; and in a large part of the south of France they rose, and pitilessly massacred their political opponents. The murders committed by them far exceeded in indiscriminate butchery and savageness even the brutal bloodshed which had defiled the progress of the Revolution. Throughout 1795 the efforts of the armies of France were languid—there was a feeling of uncertainty; the troops were firm to the republic, but it was not clear that the generals were so as well. Pichegru paralyzed the army of the Rhine, as well as Jourdan's army of the Sambre and Meuse, and ended the year by making an armistice with the Austrians, after which he was recalled and deprived of his command. The English armament, destined to rekindle the troubles of Brittany and La Vendée, failed wretchedly at Quiberon Bay; the genius of Hoche crushed it in the outset, and captured a large number of royalists. The central Government sent him orders to destroy them all. He shot 711 émigrés. And Charette on the other side, to be at least even with him, murdered in cold blood 2000 republican prisoners in his hands.

Disturbances in Paris.

1795.

Troubles in the west.

The Constitution of the year III. now appeared, the work of the restored Girondists. It was republican, of a modified type; it entrusted legislation to two councils, the council of the Ancients, 250 persons of forty years of age and upwards, a kind of senate, who sanctioned the laws (or, to put it the other way, had the veto-power); and the council of Five Hundred, men at least thirty years old, who had the preparation and initiation in law-making. The executive power was entrusted to a Directory of five members, under whom should be responsible ministers, and all the machinery of practical government. The general principles of the rights of man were reaffirmed. The Convention at once accepted it, only taking care that the royalists should not be able to get hold of power by means of it. The country generally adopted the new constitution, which seemed likely to be moderate and stable. The royalists made one determined effort (5th October, 1795), to overthrow it; the fighting was severe, and for a time Paris seemed likely to accept a counter-revolution. The energy of Bonaparte, who had been set aside because of his Jacobin opinions, but was now recalled by Barras, swept away the insurrection; Bonaparte had guns, he was a great artillery officer already, and the loose resistance of the royalists was vain against his skill and iron resolution. The elections, which took place this same month, being over, the Convention, as a last and, for the time, a very significant act, decreed the abolition of the punishment of death, and then declared its mission ended, and so ceased to exist.

Constitution of the year III.

Bonaparte crushes the royalists.

The army had saved the Convention; it had set a new man forward; and he, for all his faults, a great man and a true ruler, became after a short time the central figure of all Europe.

Napoleon Bonaparte was born in Corsica, on the 15th August, 1769, just two months after the patriot Paoli had been obliged to cede that island to France. His was a lark and thoughtful boyhood. He loved history, above all the history of great men in the republics of antiquity. He read with eagerness both Cæsar's *Commentaries* and, like so many other great men, Plutarch's *Lives*. The French tongue was a foreign language to the boy; he learnt it late, and never altogether mastered it. In 1785 he was at the military school at Paris, where he learnt to grumble at and to criticise the ancient régime; in the next year he entered the army. When the Revolution began he declared warmly for it, though at first his ambition seemed rather to point to a career in Corsica than to one in France. When Paoli ejected him thence in 1792, he settled, first at Nice, then at Marseilles, with his mother and sisters, who had gone from Corsica with him. In 1793 he became captain of artillery, and was charged to put down the Marseilles federalists; this successfully accomplished, he was made adjutant-general at the siege of Toulon, and by storming the Éguillette fort, secured the fall of the town. He was at once, at the

Earlier history of Napoleon Bonaparte.

1794-1795. age of twenty-four, named a brigadier-general, and, after arming the Provençal shores against English attacks, was sent to command the artillery (in 1794) in Italy. Here his vigor, amazing power of organization, and genius in war gave a new turn to affairs, and secured the brilliant success of the campaign, which, in about a month's time, made France the mistress of the Alps. This triumph made Bonaparte a great favorite with the Robespierres, especially with the younger brother, who had at this moment the charge of the army of Italy; and the young general, without believing much in them, echoed the high-flown sentiments of his chiefs, accepted, with contempt, their opinions, while, as far as he dared, to his honor be it said, he sheltered those who in Italy were obnoxious to their vengeance. In after life he always shunned reference to this period of his career, and his connection with the brief ascendency of Rousseau's reign of virtue as expounded by Robespierre. At the time he saw that it would not last, and tried his best to avoid compromising himself. He got his reward; when Robespierre fell, though he was arrested, and had a narrow escape, his prudence had kept him sufficiently clear of the fallen leader to save him. For a time he was in disgrace, and with other officers of the army of Italy was suspected of strong Jacobin tendencies. When, however, Barras, in October, 1795, needed a vigorous artillery-officer for the streets of Paris, he found one in Bonaparte, whom Pontécoulant, with a clear sight which does him great credit, had made president of the "topographical cabinet." For Bonaparte, not being a real Frenchman, knew the value of geography, and understood how to use a map. The remarkable skill and energy with which the young general crushed the Vendémiaire insurrection secured his fortunes; with the army he had defeated Paris. He was made general of division and commander-in-chief of the army of the interior at the age of twenty-six. The event "showed the world," says Lanfrey, "what can be the weight of a soldier's sword in the balance; from this inauspicious day power learnt to reckon on the army, the army to dispose of power; the path towards a military government was now open."

The Directory.

First, however, the Directory must have its course. The Legislative Assembly, with seemingly the fairest prospects, had lasted less than a year. The National Convention saw the fall of the Girondists, then of Hebert and Danton, lastly of Robespierre, and existed three clear years. The Directory, which came into office with a new constitution on October 28, 1795, had before it no less than four years of power. And yet at first, so far as could be seen, its chances were bad. The five directors, with exception of Barras, who was a noble, and suspected of reactionary leanings, were honest republicans, and men of character; they set themselves to allay the commercial and popular misery of the country, by absorbing a large portion of the assignats, and then by replacing them with "territorial mandates," which represented a fixed amount of public lands; a considerable amount of coin came again into circulation, and credit seemed to revive. They also abolished the commune of Paris, created an army for the "interior," and established guards for the public service. Stability seemed to return; men were weary of the agitations of late years; the famine also abated, so as to render Paris less difficult of management. It was felt that the Government was in a way provisional, that France had need of repose, and as usually happens, indifference succeeded as a reaction from the heroic measures of the past. The councils of the Ancients and of the Five Hundred were one-third new; and the elections had shown that the country was weary of the Revolution, and desired a return to a constitution, and perhaps even to a monarchy. The bourgeoisie of France were the strength of this movement. The republican party, which had offended Paris, and refused to ally itself with the doings of the Jacobins, seemed weak, and was obliged to stand on the defensive. The royalists, to whom had rallied many of the old Girondists, were able to pass more than one decree in favor of their views. Had there been a prince of any resolution at their head, their chances would have been good; as it was, the count of Provence, who in this year was recognized by the crowned heads as Louis XVIII. on the death of his nephew, the dauphin (the titular Louis XVII.), was an intelligent and liberal person, but wanting in power, while his brother the count of Artois (afterwards Charles X.), whom he now named lieutenant-general of the realm, was a miserable and narrow creature, of good manners and bad morals, incapable of any worthy or heroic effort. When the Vendeans and Bretons were eager to revolt again, and Charette had prepared everything, the count of Artois could not even be persuaded to land; he returned to England, discredited and despised. The fierce outbreak of despair with which Charette signalized his disappointment and anger was soon mastered by the devotion and genius of Hoche, who circled round the revolted districts, gradually hemmed in the insurgents, and eventually took and shot the desperate chieftain himself. His comrade Stofflet had perished a month before. By April, 1796, the west was completely pacified, and 80,000 of the best soldiers of France were free for foreign service. At the other extreme, the former "Terrorists" formed a great secret society called the Conspiracy of Babeuf; their plans were betrayed to the Directory, and the movement easily crushed; the Government used no vengeance; only Babeuf and one comrade were executed.

1796.

Conspiracy of Babeuf.

These things gave stability and confidence to the new administration; it seemed to win the good-will of all except the extreme parties; there was a distinct lull in political passion; and as the Directory proved very enterprising and warlike in foreign affairs, it also secured the army. This was in large part due to the military genius and temper of Carnot, "the organizer of victory," who was one of the Five. He now planned a grand attack on Austria, feeling that the hostility of England might for the moment be neglected. Three armies, led by three young generals, were to make their way in harmony towards Vienna, one under Jourdan, the army of the Sambre and Meuse, the second under Moreau, that of the Rhine and Moselle, the third under Bonaparte, the army of Italy. This army, hitherto commanded by Scherer, who had under him Serrurier, Masséna, and Augereau, had not been inactive in 1794 and 1795. Scherer, however, had no enterprise in him, and was content with partial success; his army lay scattered along the Alps, and he seemed powerless to draw it together so as to crush either Piedmontese or Austrians; the army also was not powerful in numbers, though its quality was very good. Bonaparte, on his arrival to take the command, at once addressed them in the tone of a confident adventurer speaking to hungry mercenaries: "I am going to lead you into the richest plains on earth;—there you will find honor, glory, and wealth." Splendidly seconded by Masséna, La Harpe, and Augereau, he at once took the ascendant, and placed his victorious army between the Piedmontese and the Austrians. By a successson of rapid victories he forced the Turin court to sue for an armistice (28th April, 1796), securing the neutrality of the Sardinian and Savoyard troops, and the cession of Nice and Savoy to France at the end of the war. Then with the swiftness of an eagle he crossed the Po, won the hard-fought battle of Lodi (10th May, 1796), and entered Milan in triumph. There he re-equipped and rested his army, made terms with the dukes of Parma and Modena, raised a contribution of twenty million francs on Lombardy, the half of which, with some of the masterpieces of Italian art, he sent at once to Paris to the Directory, which received his favors with a gratitude which trembled on the verge of jealousy. When they proposed to interfere with him, he threatened to throw up his command; and so marked already was this young officer's popularity in France, that the Government shrank from accepting his resignation, and the great career was not checked. In spite of infinite difficulties, by unscrupulous assertion, audacity, genius in war, Bonaparte succeeded in humbling the Italian states: Venice, with her unarmed neutrality, was easily mastered; Beaulieu, who commanded the Austrian army now falling fast asunder, was driven back towards Tyrol; Mantua was blockaded; the pope, Pius VI., signed an armistice with the young conqueror; the English were dislodged from Leghorn and Corsica; Genoa gave in; Piedmont was quieted. When Wurmser came down into Italy with 40,000 Austrians from the armies of the Rhine, these unwilling friends of France at once turned against her; it might have well appalled a man of slighter nerve. But Bonaparte at once made head against his new foes. He was a man who never failed to see the critical point in a campaign or in a battle; and at Lonato, Castiglione, Bassano, and Saint George he drove the old marshal, with his ancient ways of warfare, completely out of Italy with vast loss. The whole series of operations had taken but a week (July 30 to August 5). He hoped next to penetrate, according to

1796.

Foreign wars.

Bonaparte in command in Italy.

1796-1797. Carnot's plan, through Tyrol into Bavaria, and there to unite with Moreau. He had, however, underrated the Austrian obstinacy; for Wurmser, gathering fresh forces, resumed the offensive, hoping to free Mantua, and to repulse the small French army. Bonaparte, who had won the battles of Roveredo and Calliano, and had reached Trent on his way for Innsbrück, at once hastened back, defeated Wurmser at Bassano and drove him towards Mantua, in which place he shut him up by the middle of September. In vain did whole German armies, released from the campaigns elsewhere, pour from the mountains down into Italy; the incredible swiftness, clearness of insight, vivacity of genius, ascendency over the soldierly mind, which mark the great commander, saved Bonaparte from being crushed. Seconded by his admirable captains, he won the fields of Arcola and Rivoli, of La Favorita and Corona, in which he utterly paralyzed the Austrians, secured the fall of Mantua, the prize for which the antagonists were striving, and led to the capitulation of Marshal Wurmser himself.

Bonaparte subdues the papacy. Bonaparte instantly set out to reduce the feeble pope, who, scared by his approach, signed (19th February, 1797) the treaty of Tolentino, under which he paid a heavy subsidy, and ceded Avignon and the Venaissin to France, and the Romagna, with Bologna and Ferrara, to the friends of France in the Milanese; Bonaparte also extorted from him a hundred of the chief works of art at Rome, which were sent as spoils of war to Paris. It was believed in France that the last hour of the papacy had struck. The young conqueror, in the midst of his most active movements, had found time to sketch out a future for Italy, and to frame his Cispadane and Lombard republics; he also signed a treaty of peace with Spain. In all things he acted promptly and resolutely, awaiting no man's orders, with perfect confidence in himself and his army The Directory at Paris could but look on in amazement, and, by seeming to advise and approve, endeavored to associate itself with his dreaded triumphs.

The campaign in Germany. The campaign of 1796 in another way was favored by fortune, so far as Bonaparte's interests were concerned; for the Rhine armies, ill-supplied, and under two commands, were opposed by the archduke Charles, and were not strong enough to carry out the great and dangerous plans of Carnot. Jourdan was repelled, and Moreau, who had penetrated into Bavaria, seeing himself almost cut off and isolated, with Jourdan on the Rhine, and the Tyrolese Alps between him and Bonaparte, was forced to retreat, and late in October was back again in Alsace. A great expedition to Ireland under Hoche also failed completely; and by the beginning of 1797 Bonaparte seemed to the eyes of all Frenchmen their only great and successful captain.

Bonaparte's plans for 1797. Now he startled all Europe by his audacious plan for the campaign of 1797. He saw his way to achieve that which Louis XIV. had attempted in vain, the overthrow of Austria by a march on Vienna. His army was strengthened, and those on the Rhine ordered to begin active operations, in order to occupy their opponents; quite early in the spring Bonaparte began his great campaign by driving the archduke Charles away from his defences. In spite of the vehement resistance of the Tyrolese and the threatening attitude of Venice in their rear, the French advanced always, and Bonaparte, crossing the Noric Alps, penetrated in April as far as Leoben in Styria; his outposts were pushed to within easy reach of Vienna. Then the Austrian court fell into panic; the Austrian armies were either beaten and scattered or were far off; there was no resisting this terrible and swift advance. The emperor gladly signed with Bonaparte (who had no authority to do it, only the power), "the Preliminaries of Leoben" (18th April) ceding to France Belgium and the left bank of the Rhine from Basel to Andernach, as well as Lombardy, which was to be an independent state. The successful outset of the Rhine campaign, in which Hoche and Moreau had already thrust the Austrians back into the Black Forest, was early arrested by the tidings of Leoben. In Italy fortune again favored Bonaparte. A Venetian insurrection gave him the opportunity of finally overthrowing the ancient republic of Saint Mark. The Venetian citizens were in the main favorable to France, while the oligarchical senate and the peasantry detested the "deliverers." A democratic government, centred in the people of Venice, replaced the rule of the senate. Genoa, under the grand title of the Ligurian Republic, became the submissive ally of France. The amazement of all Europe, the sympathy of the peoples everywhere, the embarrassments of the Governments, forced even Pitt to make serious proposals for peace.

The Preliminaries of Leoben.

Fall of Venice.

1797.

Yet at home affairs looked ill. In spite of the glorious success of the armies abroad, paper money,—which, as La Vallée says, "had done its work, had conquered Europe, had in five years subdivided property far beyond all that had been done in that direction by centuries of feudalism," because it was with paper that the thriftier peasants had been able to purchase the lands of the crown, the church, and the nobles,—these assignats had become almost worthless, and a field for gamblers, who scandalized even Paris with their sham wealth and real dissipation. Republican manners and institutions were alike corrupted and tottering to their fall. It was thought that the elections of the year V., which renewed one-third of the two councils (May, 1797), would reverse the political position, for they showed clearly that the country was returning to royalist opinions. In some departments a "White Terror," the usual accompaniment of the rising spirits of royalists, broke out. A reaction at one began in the Directory, of which three members were still firmly republican, while two, Carnot and Barthélemy, were with the new majority, the "Clichy" party. The Directory was censured for the war against Venice, and the new alliances in Italy; the exiled and depressed party were favored; it was openly said that the councils would reorganize the national guard, overthrow the Directory, and proclaim Louis XVIII. "While Europe was learning to speak with terror-born respect of the name of Republican," says Thibaudeau, "it had become at home a term of contempt, a title to proscription." Napoleon Bonaparte, with his devoted and Jacobin army, had won that respect for France abroad; how would he presently face the difficulties at home? The Directory, finding itself menaced, and its very existence at stake, recalled Hoche, the most single-minded of republicans, with his army from the Rhine, and asked Bonaparte for one of his generals. He sent them Augereau, whom he could trust both to do the work well, and not to stand afterwards in the way of his own ambition. With these the Directory carried out the "Coup d'État" of the 18th Fructidor (4th September, 1797); with cries of "Long live the Republic" the soldiers occupied Paris; the three directors, who had the stroke in hand, Barras, Rewbel, and Laréveilliere, arrested their fourth colleague Barthélemy, while Carnot, the fifth, escaped. The majority in the Councils was overthrown, fifty-three of them condemned to exile, and a kind of Reign of Terror ensued, without much bloodshed. The liberty of the press was suspended, the laws favorable to the royalists repealed, the party of the old régime crushed. Hoche, who had received the command of both the Rhine armies on the suspension of Moreau, suddenly died (it was said of poison), at the age of twenty-nine; he left behind him an untarnished name—that of a peasant-hero of purest and noblest character.

Royalist reaction in France.

The Coup d'État of the 18th Fructidor.

The Directory, though it breathed again, felt that it lived only by the grace of the army; and so, while it signed the treaty of Campo Formio (Oct. 18, 1797), which embodied the Preliminaries of Leoben, it broke off negotiations with England. Bonaparte's work in Italy done, he was named general of the "army of England," and at the end of 1797 returned in triumph to Paris. In him men saw a new development of Revolution principles, a man of genius under whom those principles were to bring happiness and glory to France, while he taught them by force to the unwilling nations of Europe. He too saw before him an open field for his ambition; he would destroy the kings of the earth by the agency of his Jacobin army; and then, "head of the army," he would become master of France. His Italian blood and tastes taught him how the Roman republic had passed into empire; he would tread the same path, and reach the same splendid goal. The *coup d'état* of the 18th Fructidor had destroyed the authority of the elective body over the Government; when the departments had sent up royalists, the Directory put them down; and, by a natural consequence, the press was at once coerced, lest public opinion, never strong in French history, should gain too much power. The result of all was the weakening of the

Treaty of Campo Formio.

1798. Directory, and the gradual preparation of France for the coming of a real master.

The Directory becomes unpopular.

For the republican party was by no means content with the five Directors,—the "five tyrants of the Luxembourg;" it was a Government without splendor, or principles, or virtue. Consequently, the elections of the year VI. showed a decided majority in favor of republican principles. The Directory did not hesitate to make a second *coup d'état*, this time against the republicans. They also put a lawyer instead of a general into the vacant place in the Directory itself, as if to show that they could do without the army now. Yet, at the same time, they had refused the advantageous terms offered them by Pitt at Lille, and were eager for war; they proposed to remodel all Europe on democratic lines, and rejoiced to have a hand in the overthrow of the papal government, which was replaced by a Roman republic (February, 1798), and in April of a Helvetic republic which replaced the old aristocratic government of Bern. By the former France defied the oldest institution in the world; by the latter she destroyed the ancient neutrality of Switzerland, a step which afterwards turned to her own loss.

Threat of war with England.

War with England was now the chief affair for France; she made preparations on the western coasts, and set a considerable fleet afloat. The state of Ireland, which was thoroughly hostile to England, invited the Directory in one direction; the appeal of Tippoo Sahib in Mysore was heard at the same moment. Should they listen to either? Should they not rather strike at the heart of the enemy by an invasion of England? Bonaparte, who was now at Paris, standing aloof from parties, advising the Directory, living tranquilly with his wife Josephine, interested in his new membership of the Institute, was destined to answer this question for them. Afraid of dropping out of sight, anxious to strike the imagination of France by some singular and distant success, attracted by that love of wide combinations which characterized him,

Bonaparte's position.

Bonaparte now proposed to the Directory to conquer Egypt. The conquest itself would be easy, for the Ottoman power was all but gone. Egypt would be a splendid colony for France, assuring her on the one hand of the Mediterranean, and on the other hand rendering the trade and mastery of England precarious, if it did not at once prove fatal to it. The thought had been presented to Louis XIV. by Descartes, and approved by Colbert. Choiseul had not rejected it in his day. "We can destroy England in Egypt," was Bonaparte's belief. On the other hand the Directory, after much doubt, adopted the project, partly because of its dimensions and startling boldness, partly because the Five could thereby, for a time certainly, probably for ever, be delivered from the terrible young general whose ambition was clear to them, and whom they feared. And so, in spite of all whisperings of prudence, and in spite of the threatening state of Europe, and the precarious condition of their power at home, the Directory sanctioned Bonaparte's plan, and furnished him with a fine fleet and army for the purpose. That able negotiator Talleyrand set out for Constantinople charged to endeavor to satisfy the Ottoman Porte as to the objects of the expedition.

The reasons for the Egyptian expedition.

The Egyptian expedition.

Bonaparte sailed from Toulon (19th May, 1798) for Malta, which, by good will of some of the knights, and the idleness and decadence of the Order of St. John, he took at once; thence to Alexandria, having escaped the English fleet under Nelson. He landed, and sent Kléber forward to capture Alexandria; then leaving him to garrison that city, he marched on Cairo, threw off the gallant attacks of the Mamelukes on the way, showed to his soldiers the "forty centuries looking down on them from the Pyramids," defeated Mourad Bey, who endeavored to defend Cairo, and entered that city in triumph. The whole of Egypt was thus subdued with one blow; and Bonaparte was already, with his wonted energy, making plans for the permanent occupation and government of the country, was setting out with his savants to explore the wealth and wonders of the land, was writing home bulletins of glory, when there spread through the camp the news of the battle of the Nile, and one great disaster ruined all. Brueys, after receiving orders either to enter the port of Alexandria or to withdraw to Corfu, had lingered near Aboukir, and was there caught by Nelson. The battle had lasted all the night of August 1; by the morning the English fleet was much shattered, but it had destroyed its enemy, with the exception of four ships which escaped to Malta. It was the ruin of the French navy; and how should the victorious army at Cairo ever get reinforcements or escape from Egypt? Was the fate of St. Louis in store for these new crusaders, who, unlike him, affected Mahometan ways and customs, and issued proclamations which the pious Mussulman might have thought written by a true believer? 1798.

Second coalition against France.

The Ottoman Porte, far from being appeased by French explanations (indeed Talleyrand, shrewd man, saw that it was hopeless, and never went to Constantinople), declared war on France, and allied itself with England and Russia,—it was the beginning of the new politics of the Mahometans in Europe, the beginning of the end for them. A second coalition was at once organized against France. Russia, under Paul I., entered warmly into it, and constituted herself the special patron and protector of the emigrant royalists; the court of Vienna made its preparations to shake off the yoke of Campo Formio; the five republics round about had learnt already that republicanism under French patronage was very like servitude,—the French having an unhappy knack of always alienating those they patronize as liberators,—and seemed weary of seeing their finest works of art sent to Paris, as if to the world's centre. They were already listening to the court of Naples which hotly urged on war. France, on the other hand, was very unfit to fight. She had lost all control of the Mediterranean the army was weaker in itself, and much weaker by the absence of Bonaparte in Egypt; finance was still amiss, with a terrible deficit; the Directory inspired little confidence. The only ally of France was Spain, and her navy had been destroyed the year before off Cape St. Vincent by Admiral Jervis.

The conscription.

The Directory raised money as it could, and passed the great law of the "conscription," by which every Frenchman was compelled to be a soldier from the age of twenty to twenty-five, and ordered an immediate levy of 200,000 men. War began at once in Italy; before the end of the year the whole peninsula from Piedmont to Sicily was at the feet of France.

Operations in war.

The Directory, having destroyed the neutrality of Switzerland, thought it now necessary to occupy that country, in order to protect the frontiers of France on that side; they also spread their forces along their whole line, from Brune who commanded in Holland, to Macdonald who was at Naples. The army of Masséna formed the centre of the whole; he was instructed to enter Switzerland, seize the central Alps and the Vorarlberg and Tyrol, and thence to threaten Venice. It was an entirely new combination in European warfare, thanks to the new Helvetic Republic. Masséna pushed forward into Tyrol, but was arrested there by the ill-success of his colleagues in Bavaria, and in Italy on the Po. Jourdan had been twice defeated by the archduke Charles on the Danube, while Scherer, in Italy, after some successes, had been obliged to fall back after a disastrous campaign. The Helvetic strategy had proved a failure, and Masséna had to abandon his enterprise. The news of French reverses reaching Rastadt, where France was still trying to intimidate the feeble princes of the empire, the French envoys were told to leave the town, and were murdered on the road by Austrian hussars. The news of this barbarous insult to the sacrosanct persons of a nation's envoys roused immense excitement in France, and entirely did away the depression which had crept over the country. The ranks of the army filled with amazing speed. The Helvetic plan of advance was abandoned; Masséna had command of his old army and that of the Rhine, with his centre from the Lake of Constance to Basel; Macdonald was withdrawn from Naples; the army of Italy was commanded by Moreau, whom the Directory had restored to favor after eighteen months of inaction, consequent on his ambiguous dealings with Pichegru.

The campaign on the upper Rhine showed that the French were not strong enough to defend so long a line; they were pushed back as far as to Zurich, where Masséna defended himself for two days against the archduke Charles, and though in the end successful, he still found it better to fall back again. The Austrians occupied the chief part of Switzerland, and waited for the Russians to come up. In

1799. Campaign in Italy.

Italy Moreau was also overpowered; his great ability as a captain alone saved his army from terrible disasters after the defeat of Cassano, in which Suwarrof treated him very roughly, driving him back and entering Milan. He took up a good position near Alessandria, and waited for Macdonald, who was coming up from Naples. After a very difficult campaign, in which Moreau showed great vigor and devotion, and Macdonald had done his best, and the French soldiers had displayed all their old bravery, the two armies, after terrible losses, united at Genoa. The Directory dismissed Macdonald, gave Moreau the command of a new force on the Rhine, and sent Joubert[1] to command the army of Italy. In attempting to save Alessandria, he was met by Suwarrof, who defeated him completely (15th August, 1799), at Novi, after a very hard-fought battle. This defeat ended the French resistance in Italy; Naples, Rome, the valley of the Po, were all in the hands of the allies. From all sides news of disaster reached Paris; the Dutch fleet passed over to the English; an expeditionary force reached Ireland, only in time to be taken prisoners; the English took Minorca and blockaded Malta; the Russians became masters of the Ionian Islands; Bonaparte even, with the army of Egypt, had suffered defeat from Sir Sidney Smith at St. Jean d'Acre on the Syrian shore, in May, after having taken Gaza and Jaffa. In India the friend of France, Tippoo Sahib, lay dead in the breach of Seringapatam (4th May, 1799). No wonder if after this the position of the Directory became very critical. It was loudly declared, in spite of facts, that the Five had intentionally sacrificed Bonaparte; the public feeling in his favor grew with men's sympathy and indignation. The Government was, with exception of Barras, one of honest mediocrity, a dangerous type in France; Sieyès, who entered the Directory in the year VII. (1799), was regarded as its enemy, and men rallied round him; Lucien Bonaparte, who was one of the Five Hundred, led the opposition, which declared the councils to be in permanent session; and thus the legislative power once more asserted its authority over the executive (18th June, 1799). It was a republican revival; the constitution of the year III. seemed to be set aside; the character of the Directory was changed by new appointments; things fell into confusion. It was clear that a head was wanted.

Bonaparte's return.

Tidings of this state of things at last reached Bonaparte, who had been completely cut off from France by the disaster of the fleet. It is said that he learnt it from a packet of gazettes forwarded to him by Sir Sidney Smith. Turkish armies had been gathering force against him, and baffled in Syria, he had now to fight for existence in Egypt. The battle of Aboukir (24th July, 1799), which destroyed one of their armies, set him free. Not without lies and deceptions he stole away, leaving his army under command of Kléber, whose independent temper troubled him; for as he had failed to conquer Syria, and to win an Oriental empire, he must now hasten home to push his fortunes in France. About the time that he reached Paris (October, 1799) in a kind of triumph, as the hero of the brilliant success of Aboukir, the anxious country also received tidings of the splendid campaign of Masséna in Switzerland, the victory of Zurich (24th September, 1799), the quarrels of Russia and Austria, the retreat of Suwarrof into Bavaria, and of the lesser successes with which Brune defeated the duke of York in Holland, and forced him to sign the capitulation of Alkmaar (18th October, 1799). France, relieved rather than triumphant, welcomed Bonaparte with enthusiastic transports. No one cared to inquire what he had done with his army; he was there, and that sufficed; he was there, and the reign of order was about to begin. To this, then, had the reign of Reason, the rights of men, the republican propaganda, fallen; men yearned only for a strong man, a stable government under which they might have equal peace. And Bonaparte was willing enough to accept the part thus pressed on him; he called to himself the moderate party, by far the largest in France, and prepared to seize on a dictatorship.

The Coup d'État of 18th and 19th Brumaire.

On the 18th and 19th of Brumaire (9th and 10th November, 1799), Bonaparte, who had allied himself with Sieyès, and had round him a powerful group of friends and generals, carried out his plans in spite of the resistance of the patriots, the hostility of the Five Hundred, the uncertain temper of the troops. It was a moment of immense peril for Bonaparte and his brother Lucien, until, in reply to an appeal to the soldiers, in which nothing was spared that could rouse them, the grenadiers rallied to their hero, and ejected the council then sitting at St. Cloud. The Directory was suppressed, and in their place were three consuls, appointed provisionally. These were Napoleon Bonaparte, Sieyès, and Roger-Ducos. Two commissions were named to revise the constitution. The three consuls took oath to the Republic. 1799.

The last stage of the Revolution.

Thus the Revolution passed into its last stage. It had tried to live with a king, had tried to govern by democratic severities, had also been moderate; it now became military. The despot, who, according to Aristotle, haunts like a dark spectre the steps of democracy, had now, at ten years' end, overtaken and destroyed its forerunner. "Eadem magistratuum nomina," no doubt; also, as in the case of imperial Rome, a new dynasty founded on the sword.

Bonaparte's position.

Bonaparte had no sooner secured his revolution than he set himself with his wonted vigor and sagacity to consolidate it. He saw that France was weary at heart of the struggles and changes of parties; he wished to sweep away all remembrance that he too had been, in profession at least, an ardent partisan; he felt that he, supported by his bayonets, was strong enough to treat faction with contempt. Therefore he said, "Let there be no more Jacobins, nor moderates, nor royalists; let all be Frenchmen;" and as he said it, all France recognized that this was the equality they sought, and hailed him as their master. When the consuls sentenced fifty-nine democrats to exile, the popular feeling showed itself so completely in favor of an amnesty for all that they were compelled to recall the order. Parties were now insignificant, because Bonaparte was great.

Constitution of the year VIII.

On the 13th of December, 1799, the "Constitution of the year VIII.," chiefly the work of Sieyès, was put forth. There were to be three consuls, first, second, and third, not equal as at Rome, named for ten years, and re-eligible. Of these the first consul had in fact all the power; he alone could promulgate laws, name ministers, ambassadors, and officers generally, while the second and third had only a consultative voice, which could not be of great avail; their two voices could not out-vote that of their so-called colleague. A council of state was to be charged with the drawing of all laws, its members to be named by the first consul; laws thus framed should be presented to a tribunate of a hundred members; this body, after discussion of the project, was to pass it on, in the hands of three orators, who should discuss it against three counsellors of state nominated by the Government, in the presence of the legislative body, which finally adopted or rejected the law by a secret ballot without debate. This legislative body was composed of three hundred members. Lastly, there was to be a senate of eighty life-members, who should confirm or annul all acts which might be referred to it, on grounds of their constitutional character. They also were to name the consuls, tribunes, and the legislative body, choosing them from a list of 5000 names, which were to be chosen by 50,000 persons, who themselves should be elected by 500,000 electors, who in their turn were to be named by universal suffrage. Senators were to be elected to vacancies by co-optation, from a list of three candidates presented by the legislative body, the tribunate, and the first council. Bonaparte had modified this elaborate structure before it saw the light, by significantly cutting out all the poor guarantees for liberty it contained. As it stood, it was merely the decent robe which shrouded the naked dictatorship of the first consul. The people, by an enthusiastic plébiscite, adopted it almost unanimously. Bonaparte having accepted the post he had arranged for himself, two new men were associated with him; Cambacères, a distinguished lawyer, and not a politician, as second consul; and Lebrun,[2] an elderly man, good at the bureau, the type and representative of French officiality, as third consul. The senate was filled with the most distinguished names in France—men great in science and arts, as well as in arms or politics; the legislative body whom they selected, after the decimal system explained above had reduced the candidates to 5000, were certain to be quiet obsequious people. Finally, lest public opinion should be disturbed in its happy unanimity, the freedom of the press came suddenly to an end; for the First Consul thought that thirteen journals were enough for France,

The three consuls.

[1] [Barthélemy C. (1769–99), rose from the ranks, served with Massena, subdued Würmser and the Tyrol, captured vast stores at Turin, commanded the army of Italy, was killed at Novi.—AM. ED.]

[2] [Charles François (1739–1824), at first a republican, imprisoned by Robespierre, president of the 500, governor of Genoa and Holland, made a peer by Louis XVIII. His *Memoirs* appeared in 1829.—AM. ED.]

1800. and these were all duly submissive to the Government. Thus did dictatorial power usurp the place of liberty, and a system began, based on falsehood and illegal force, yet so splendid and so well-suited to the needs of fainting France that she has only in our day at last escaped from the glamour of it, and from the worship of the Napoleonic idea. The First Consul took up his abode, early in 1800, at the Tuileries, and at once formed a ministry:—his brother Lucien for the home office; Gaudin for finance; Berthier for the army; Talleyrand, ex-bishop, for foreign affairs; and Fouché, lord of spies, for police,—the last two the only politicians in the company; they both had abandoned holy orders. Without a portfolio, in close relation with Bonaparte, was Maret, better known by his later title of duke of Bassano, the first founder of the *Moniteur Universel*, a man of upright character and unwearied industry. The spirit of system, visible in the constitution, and in the tastes and character of Bonaparte, was at once indelibly impressed on the administration of the country. All sprang from one centre, the First Consul; a prefect was set over each department, with sub-prefects under him; it was a more perfect development of the intendant's office under the old régime; the prefects named the local mayors, and thus the whole machine received all its impulses from headquarters, and formed a perfectly compact and easy-going government. Local law and local finance were also organized in a similar way; and by a simple edict as to the method of tax-gathering, joined to the new confidence all France felt in her ruler, the crushing difficulty of the deficit was at once got rid of. Peculation became impossible; taxpayers were equally and fairly charged; none were allowed to fall into arrears; and the country, being really rich, speedily rose into prosperity. Salaried officials covered the whole land with a network, each for his daily bread interested in the stability of government. The principle of the new government, in general administration, in finance, in the church, in the law, was that of absolute subservience of all officials to the head; and the love of France for bureaucracy, which has made her the chosen land of an official hierarchy, made this organization the most complete and successful that the world had hitherto ever seen. The disturbances in the west, caused by the monarchists, were put down without difficulty.

The First Consul and his ministers.

The new despotism.

Bonaparte had promised peace to France; and he at once wrote a letter to George III., with characteristic indifference to the English constitution, offering to make peace directly with him. Pitt, as minister, replied by refusing to negotiate till France should replace on the throne her ancient dynasty. The terms of the refusal offended the French people, and strengthened Bonaparte's position. Russia made peace; Prussia stood neutral. Austria and England, with Bavaria, Würtemberg, and Mainz, determined to continue the contest.

Proposals to George III.

The campaigns of 1800 were thus planned by Bonaparte. Masséna with a weak army was left to defend the Riviera from Nice to Genoa, and there to employ as much as possible the Austrians in Italy. The Rhine army, led by Moreau, should threaten Bavaria, after finally grasping the all-important strategic position of the corner of the Black Forest, between Rhine and Danube; meanwhile Bonaparte himself, quietly and with scrupulous secrecy, collected a third great army for himself, destined for the Po. Masséna's army was driven back and suffered considerable reverses; the Austrians under Melas penetrated across the frontier; Bonaparte, however, knew that Provence was not the heart of France, and that with Masséna holding out at Genoa, no very serious attack could be made in the south. Moreau's army of the Rhine penetrated into Bavaria, drove the Austrians back to Ulm, and prepared to send a part of its right flank across the Alps to join the main central movement of Bonaparte. His army of the centre, collected rapidly at Geneva, made its famous passage of the St. Bernard, while his right went over the Mont Cenis, and the right flank of Moreau's army, now his left, crossed the St. Gotthard. To the amazement of all, the Austrians saw Bonaparte returning to the scene of his old triumphs, and entering Milan in triumph. They hastily drew themselves together; the fall of Genoa, after a splendid defence by Masséna, freed a large force. The astounding battle of Marengo (14th June, 1800) decided the campaign; "in it the Austrians lost all they had gained in eighteen months and by twenty victories." The armistice of Alessandria followed at once; for Marengo had given Bonaparte the command of all the upper valley of the Po, and the Austrians withdrew behind the Mincio. Meanwhile Moreau, with the army of the Rhine, was doing excellent work in Bavaria, and had taken the ascendant all along his line, when tidings of the convention of Alessandria brought his campaign to an end. Peace, however, did not follow; the English Government eagerly urged the Austrians to hold on, and hostilities began again, late in the year, in the valley of the upper Danube, where Moreau, supported by Ney, won the splendid victory of Hohenlinden not far from Munich (2d December, 1800), and after a series of brilliant combats drove the Austrians back, till Vienna was in terror. Then an armistice was signed at Steyer, by which Austria ceded her strong places in Tyrol and those of Bavaria to the French army. The army of Italy also won great advantages, and compelled Austria to sign an armistice, by which France occupied a number of important points in north Italy. In concert with Pius VII., lately elected pope, Murat menaced the kingdom of Naples, and a third armistice, which closed the Neapolitan harbors to England, ended the war. The peace of Lunéville was concluded on February 9, 1801, between France and Austria. It was drawn on the basis of the treaty of Campo Formio; France secured the left bank of the Rhine and the Belgian provinces; the independence of the four republics was recognized; the pope was replaced in his states; Tuscany was ceded to France, and became the heart of a new kingdom of Etruria. The king of Naples also made his peace with France, on the terms of his armistice.

Campaigns of 1800.

1801-1802.

The battle of Marengo.

Peace of Lunéville.

England alone stood out against the First Consul, who seemed able to impose his will on Europe. It is impossible, at this distance of time, to realize completely the combination of causes which led to the determined resistance of England; the most prominent and least defensible cause was the "dominium maris," asserted in opposition to the principles of the armed neutrality of 1780. At the end of the 18th century the English navy had risen to very great proportions, and the interests of the country, as was then thought, were hostile to the claims of neutral commerce. Consequently, the northern powers, irritated and insulted by English claims carried out with the strong hand, formed a great coalition at the end of 1800, in which Denmark and Sweden, Russia and Prussia, set themselves to secure the liberty of the seas. They invited the First Consul to join them, and he desired nothing better; it seemed as if the national hatred of France against Pitt and England would now find vent, and would overthrow that persistent enemy. It seemed, too, as if Bonaparte, as he consolidated his power at home, would be able to assert himself also as the protector of the liberties of Europe abroad. On the other side, the English Government did not waste time. Parker and Nelson were sent into the Baltic, to break up the coalition, if possible. As Denmark had the most ready fleet, and was in fact the most active member of the coalition, Nelson determined to strike hard at Copenhagen. The hard-fought battle of Copenhagen, in which the Danes made heroic resistance to the English forces, led to an armistice; and the assassination of the emperor Paul I., which reversed the policy of Russia, brought the great coalition to an end. By the summer of 1801 the northern powers were all again the friends and allies of England. It was in vain that Bonaparte threatened the English shores with invasion; he felt that his great plan had broken down, and wanted a little breathing time. He made peace with Portugal, occupying with French troops two of its provinces. On the other hand, the army Bonaparte had left in Egypt, after the refusal of England to allow it to return to Europe, had lost its general Kléber, who had been assassinated by a Turk; all the efforts made to reinforce the army from France failed; an English force from Minorca, and 7000 Sepoys from India, as well as a Turkish army, now converged on Egypt. Abercromby, at Aboukir, repulsed the attack of the French under Menou; the French army after a short time had to capitulate (27th June, 1801), and was carried over to France in English ships.

The opposition of England.

At the same time war between France and England was drawing to an end; the negotiations were concluded in March, 1802, by the peace of Amiens. The principles of the armed neutrality had failed to establish themselves, and Eng-

1801-1804. land secured not only her command of the sea, but her lordship over India. She had also freed Portugal, the kingdom of Naples, the States of the Church, from French control; Egypt was restored to the Sublime Porte. On the other hand, the authority of France in central Europe remained unbroken; the great campaigns on the Po and the Danube had secured this result. The brilliant successes of the French arms, and the treaties of Lunéville and Amiens, prepared the way for the next forward movement of the First Consul. Meanwhile France at home was prosperous and productive; Bonaparte's splendid gifts of organization continued to work wonders; he made the income of the country meet all the outgoings, and created a real surplus, a thing unknown throughout the previous century. On every side fresh energy was evoked, new enterprise stimulated; all things were felt to proceed from one centre,—a centre not, as in the old monarchy, of selfishness and waste, but of active and beneficent influence. Too little was left for private and spontaneous effort, that being the weak side of the development of France; yet considering the state of the country, the rule of a beneficent despot was welcome and most successful. The greatest work of this period was the construction of the civil code, on which Bonaparte himself worked with amaziug zeal, clearness, and ability. It was issued in January, 1804. In other domestic matters his ascendency displayed itself more and more; the attempts made against his life enabled him to crush and terrorize the extremer republicans. The system of *senatus-consultes*, by which he veiled his arbitrary edicts under the authority of an obsequious senate, enabled him by degrees to crush the remnant of free discussion still possessed by France in the tribunate of the constitution. He got rid of constitutional opposition as readily as he had freed himself from the attempts of conspiracy, and reduced the legislative assembly to a nullity. The age of the Revolution seemed to be past; the grand organizing faculty of the First Consul was doing what the destructive forces of the republic could not do,—was reconstructing society on a basis partly new and partly old, was centralizing authority, was creating a despotism adapted to the phraseology of a "Republic one and indivisible," and giving to France a new position among the nations. For the autocracy of Napoleon was the direct outcome of republicanism, as it allied itself with military organization, and slowly attracted to itself many of the relics of the old order of things. Though essentially hostile to real liberty, the coming empire sprang out of a great and generous effort made by France in that direction; it was not till our own days that she succeeded, if even now she has succeeded, in shaking off the iron trammels of imperialism, and ruling herself with constitutional freedom and calmness under the republic of her choice.

The peace of Amiens.

Bonaparte's organizing power.

The Code Napoléon.

In these years (1800–1804) the First Consul not only crushed the spirit of the two chambers and the tribunate, but also passed on boldly to reconstruct French society, a much harder task. Directly after the peace of Amiens, when France was in the first flush of an unwonted tranquillity, Bonaparte made terms with the papacy, and by the Concordat reconstructed the Church of France. All the old divisions were swept away; ten archbishoprics and fifty bishoprics were newly mapped out by First Consul and Pope; and in 1802 the will of Bonaparte and Pius VII. peremptorily put an end to the schism between refractory and constitutional clergy, and so cut away from the ancient monarchy its chief support. The traditional life of the church was rudely cut off; the authority of the state was displayed in full; the constitutional priests were sacrificed to the political needs of the First Consul, who saw that, if he would have firm hold of power, he must first win over the royalist clergy. The chief opponents of the Revolution got the chief rewards; the constitutionalists were mortified. From this moment dates the friendship between the Napoleonic dynasty and the Church of Rome; from this dates also that secret hostility between the clergy and the army, which has often since that period produced results none the less striking because their origin was concealed. For the time, however, the paramount authority of Bonaparte over the army made resistance impossible. The weak point in the arrangement was the certainty that in their hearts the courtier-like clergy would always prefer a Bourbon to a Napoleon; and of this, too, history has provided more than one proof. Still, for the time, in church as in army, the step was successful, and gave strength to Bonaparte's position. The emigrants also returned, thanks to an armistice, and in large numbers took oath to respect the new government. It was a bold and hazardous step, which the First Consul afterwards saw good reason to regret. An exiled adherent of a lost cause never changes, never learns prudence, never is satisfied with the *de facto* ruler of his people; his mind is warped, his moral sense, in matters political, vitiated; the existing government has in him a secret enemy, a plotter and intriguer, a fierce fanatic, outwardly subdued, inwardly smouldering, and ready to burst forth in flame whenever the breath of a royal whisper fans the embers.

The reconstruction of society.

The Concordat.

1804. Return of the émigrés.

In restoring the Catholic clergy and the ancient nobles to France, Bonaparte affirmed a principle hostile to the revolution, necessary for a despotism. He must have classes of society "intermediate," as he said, "between the people and the powers;" "to settle the bases of the Republic, one must throw on the sand some masses of granite," an apt illustration of the way in which this despot of an iron will determined to crush all liberty in France. Unfortunately for him his heavy "masses of granite" after all, while they crushed the people, formed but an insecure foundation for himself. The same motive led him to reorganize education and to establish the university—in his hands a mere creature of power, a machine to turn out public officers, and to centralize and unify all education in France; public schools or *lycées* throughout France were all dependent on this central university. Education, as is always the way under a despot, took a mathematical and scientific bias; moral sciences and history found no place; theology was left for the clergy in their seminaries; the dead languages held a secondary position. To this new organization France owes, in large part, her unpractical ignorance of modern languages, geography, political economy; she has not yet entirely shaken off the load thus imposed on her shoulders. Next, the institution of the Legion of Honor was the beginning of a new aristocracy, and was meant to supply another blank in the new hierarchy of this growing military despotism. Finally, the First Consul constructed a new constitution, that of the year X., which strengthened his own position, and weakened still further all the elements of republican and constitutional opposition. It was adopted with obsequious unanimity (4th August, 1802). During this period the influence of the First Consul was also dominant across a large part of Europe: the four republics rested on him, and were much modified at his demand; the lesser states of Germany allowed him to interfere in their affairs; he was able to overcome, at least for a while, the suspicion and ill-will of Russia. On the seas also his activity was felt: he was anxious to restore the colonial power of France, shattered by the war; he interfered in the affairs of Hayti, and hoped also to recover his influence over Egypt and the Mediterranean. England, seeing her special province of the seas thus invaded, and never very well pleased with Bonaparte and the peace of Amiens, declared war against France in the spring of 1803.

The university of France.

The Legion of Honor.

The constitution of the year X.

Bonaparte at once occupied on the one hand Hanover, on the other Naples, made friendly overtures to the United States, and threatened the English shores with invasion. Europe was divided into two hostile camps, and a great and stubborn war impended. Russia at once sided with England; the court of Vienna, though unable at once to go to war, warmly sympathized with the opposition to France; Prussia held aloof; England also seconded the underground resistance of the old royalists in France. This was the period of the conspiracy which led to the seizure by Bonaparte of the duke of Enghien, a seizure on the soil of Baden, excusable on no plea of international law or sudden necessity, his military and violent mockery of a trial, and his peremptory execution. Moreau, whom the First Consul was glad to be rid of, for he alone could be a rival in the affections of the army, was exiled to the United States; Pichegru committed suicide in prison; a handful of others were executed; and the First Consul, taking advantage of the excitement and indignation of all France, had himself proclaimed Emperor of the French (18th May, 1804). A new constitution, of imperial texture,

Second war with England.

The Empire

1804-1807. was woven for the occasion. Hereditary succession was affirmed; six great dignitaries, with high sounding imperial titles and no power, were established; the military splendors of the marshalate reappeared; the council of state and the senate were charged with all legislative functions; the older bodies, the tribunate and the legislative body, were a mere appendage; and thus began the imperial age.

VI. The Empire.

Imperialism. Imperialism is an overlordship over nations. It is more than this; it is, strictly speaking, the representation of both the empire of old Rome and the Holy Roman Empire, with all the high claims involved therein. In this sense, imperialism claims temporal lordship over all the earth, and rears its head side by side with the papacy, which asserts a spiritual headship as wide and as complete. The full theory of neither has ever been realized; and as time has gone on, both ideas have grown weaker, and pale images of both have sprung up. As the world has become wider, it has become clear that neither the principle of nationality nor that of independence of thought was compatible with either empire or papacy. And, as time has gone on, the imperial name itself has undergone large modifications. We have seen an empress of India, an emperor of Austria, an emperor of China, an emperor of Mexico,—all names completely wide of the true imperial idea. And the title of "Empereur des Français," which Bonaparte now assumed, with acclamation of France, carried in itself a reversal of old ideas, for it affirmed a personal lordship, based on the sovereignty of the people, as expressed by a plébiscite. Be this as it may be, the power was real, and was wielded with iron will and unscrupulous genius.

The third coalition. The strength of England on the seas soon compelled Napoleon to make his chief attack on Austria, while England and Russia once more drew together against him. In 1805 his grand army penetrated into the valley of the Danube, took Ulm, and in spite of the king of Prussia's accession to the coalition, pushed on as far as to Vienna. Napoleon occupied all the upper and middle Danube valley, and then marched northwards in pursuit of the emperor Francis of Austria, who had fled into Moravia. On the 2d of December, 1805, he won the great battle of Austerlitz, which for the time reduced the allies to impotence. Peace followed at Presburg (26th December, 1805), between France and Austria, by which that ancient power was parted out among its neighbors.

Peace of Presburg.

Battle of Trafalgar. Two months before this the decisive battle of Trafalgar had finally disposed of the remaining naval force of France and Spain (21st October, 1805), and, leaving England in complete security, enabled her to continue without fear her task of obstinate resistance, at the very moment when France seemed to have completely triumphed over the united hostility of continental Europe.

Napoleon's Confederacy of the Rhine. The emperor at once, characteristically guided by his love of grand conceptions and far-reaching combinations, set himself to surround France with a great system of "federative states of the empire," in "three compact nations of Italians, Germans, Spaniards." But if he overrated his own constructive genius, he underrated the obstinacy of his enemies, and soon found himself met by a fourth coalition, against which he proposed to build up the Confederacy of the Rhine, and to restore the dependence of the lesser German princes on France, and so to carry out the ideas of Henry IV., of Richelieu and Mazarin. War, however, broke out in a different quarter. The restoration by France of Hanover to England, a part of the series of negotiations which followed the peace of Presburg and the death of Pitt, roused the utmost anger in Prussia, and led to new combinations, as a consequence of which the king of Prussia, without waiting for help from England or Russia, rushed on war (September, 1806). The battle of Jena (14th October, 1806), and Auerstadt completely overthrew the Prussian power, and the conquest of Prussia was completed before the end of the year, and before the Russians had time to come up to the succor of their allies. A winter campaign followed, in which the sufferings of the troops and the obstinate resistance of the Russians at Pultusk and Eylau (8th February, 1807), arrested the triumphant movement of the emperor for a time. In the summer of 1807, having secured the line of the Vistula, he defeated the Russians at Friedland (14th June), and took Königsberg. The treaty of Tilsit (7th July, 1807) followed; for Russia needed rest, and Napoleon was not sorry to pause. It is the highest point of the emperor's renown. His hand was felt throughout all Europe; it seemed as if England alone was beyond his power.

War with Prussia.

1807-1811.

The treaty of Tilsit.

The determination of the emperor to rearrange the whole map of Europe, and to assert his power in every quarter, led him to that Spanish war whence sprang the resistance which at last overthrew him. For he decided on subduing the whole Peninsula, including Portugal; the Portuguese court took flight to Brazil on the approach of Junot, and Charles IV. of Spain abdicated when Murat threatened Madrid. Napoleon at once placed Joseph Bonaparte, a very incompetent person, on the Spanish throne; and when the Spaniards showed their irritation with him, he too abdicated, and gave place to Murat, who had married Caroline, sister of the emperor.[1] Then the Spaniards rose in revolt, and that wearing guerilla warfare began which opened the way for the successful arms of England. The capitulation of Baylen ruined for the time the French power in Spain; Dupont and Vedel were compelled to lay down their arms; in Portugal England now began to appear, and on 21st August, 1808, Sir Arthur Wellesley won the battle of Vimiera. When Napoleon found that, as thus in Spain, the peoples rose against him, he ought to have recognized the hollowness of his friendships with the kings. He longed, however, to be one of their comity, as well as to have vassal kings and princes under himself; to this end he had created a new and high-sounding aristocracy around his throne; for this end when Germany, led by Austria, now began again to move against him, Napoleon drew towards Russia, and was completely duped by the emperor Alexander. Having, as he thought, made all safe on that side, he turned his attention to Spain, and, in spite of guerilla warfare, entered Madrid (4th December, 1808). Sir John Moore, who from the west coast had penetrated as far as to Salamanca, was driven back by Soult supported by the emperor, and after the battle of Corunna (14th January, 1809), in which he fought at bay and lost his life, the English had to embark and withdraw. The siege of Saragossa, however, contested with all the tenacity and devotion of the Spanish character, wore out the strength of the French forces, and their tenure of Spain was felt to be most precarious.

The Spanish War.

Fifth coalition. Now followed a fifth coalition against Napoleon, whose subjects at home were beginning to show signs of exhaustion. Still, when his army marched into Bavaria it seemed as strong, as enthusiastic, as well commanded as ever. By splendid combinations and a series of victories, Napoleon swept down the Danube valley, and took Vienna. Ere long he was checked by the terrible battle of Gross Aspern or Essling (21st and 22d May, 1809) just below Vienna, in which his victory was purchased at a price he could ill afford. He had to pause, while the Austrian court gathered itself together in Moravia. When he saw this, and felt that all Europe was beginning to move behind him, he too gathered his strength up, and marching against the Austrians defeated them, under the command of the archduke Charles, in the decisive battle of Wagram (5th and 6th July, 1809),—a victory which, while it ruined for the time the military power of Austria, also weakened him to a dangerous point. It was therefore at once followed by the armistice of Znaim, which led in a short time to the hollow peace of Vienna. This agreement broke up the coalition, handed over to Napoleon the Illyrian provinces with a part of Tyrol, and gave him an imperial bride in Maria Louisa, daughter of the Austrian emperor. Napoleon at once returned to Paris, to celebrate his marriage, and to organize afresh his vast empire. Nothing escaped his care; he coerced the press, rearranged finance, which had grown to be a very heavy burden, saw that the church was duly submissive and duly paid, and held the pope in honorable bondage at Savona. In other parts things went not amiss: the foolish Walcheren expedition mouldered away; in Spain Wellington with difficulty held out against Spanish indolence and corruption, and the genius of Marshal Soult. The lines of Torres Vedras (1810–1811), which the English gen-

[1] [Joseph did not abdicate, nor did Murat succeed him in Spain, but in Naples. See Vol. IV., p. 25.—Am. Ed.]

1811-1812. eral defended against Masséna, form the turning-point of the history of Napoleon's triumphs. His last great victory was Essling; henceforward his successes will bring no lasting good; his failures will draw him toward his fall. The successful winter in the Torres Vedras lines was followed by Wellington's famous campaign of Almeida, Badajoz, and Ciudad Rodrigo (1811–1812), in which the English general separated Soult and Masséna, while he secured for himself a splendid base of operations for the future.

The war with Russia. But before this, the flattering friendship of Russia had turned to gall. Ever since the end of 1809 Napoleon had seen how hollow all was in the north, and at last, early in 1812, war broke out. Napoleon, misled by brilliant schemes, and ever trustful in his star, determined at once to crush the resistance of Russia; as he had entered Berlin, Madrid, and Vienna, so he would also enter Moscow, and thence at last dictate peace to all the world. He seemed to think he had two things only to do, "conscrire et prescire,"—to summon up and sacrifice the whole youth of France as conscripts, and then to prescribe his own terms to Europe. This terrible blunder cost him his throne. He left his soldiers in Spain to take care of themselves; though he must have seen that they were almost as much in want of help as that army had been which he so selfishly left behind him in Egypt. With this difficulty in his rear, and the vast distances, huge armies, and terrible climate of Russia before him, he set forth in the spring of 1812 on his famous and fatal march to Moscow. He crossed the Niemen and reaching Wilna, the capital of Lithuania, halted there to recruit his troops (June, 1812), which were in unusual disorder. Here he proclaimed his sympathy for Poland, while he tried not to offend the Austrians or to unsettle their share of the dismembered kingdom. Negotiations also went on; the emperor of Russia offered terms, which were refused at once; Bernadotte, now by election prince-royal of Sweden (21st August, 1810), who knew the character of his late master, also had dealings with Napoleon, while at the same time he made alliance with the czar, and began a sixth coalition against France; England joined the new league, and Turkey made peace with Russia. Still Napoleon persevered; he won the hard-fought battle of Smolensk (17th August, 1812), though he did not succeed in cutting off the retreat of the Russians, who burnt everything as they withdrew, leaving a desert for the French. The terrible battle of Borodino, one of the hardest struggles in history, gave Napoleon a victory, though the Russians again withdrew in good order (7th September). They did not attempt to defend Moscow, retiring thence, and leaving the capital as "a snare in which the ruin of the foe was inevitable." And so it proved; the French army entered Moscow in triumph, and Napoleon established himself at the Kremlin (15th September); the next day the whole town burst into flames; after five days nothing was standing save the churches, and perhaps a tenth of the city. It was savage as it was heroic; at any rate, it was completely successful. The emperor Alexander spurned all overtures for peace; his armies grew more threatening; the French communications were clearly unsafe; the winter was not far off; it looked as if Napoleon might even be shut up in Moscow. The great retreat was inevitable. In the middle of October the French army began to pour out of the gates of Moscow, and then began a running battle at every point. The army bled at every pore, and Ney with the utmost heroism protected the rear. At last Napoleon reached Wilna; there the worst of the pursuit seemed to be over, and there were both food and raiment; there he, leaving Murat in command, abandoned the shattered remnants of the grand army, and took flight to France (5th December, 1812). The remainder of the retreat was even more ruinous than what had gone before; it was but a handful out of so great a host that reached the frontiers of France again. Of 450,000 men who set forth, probably not 100,000 returned.

Sixth coalition.

The war in Spain. In Spain affairs had been almost as bad for France. Early in 1812 Wellington had taken Ciudad Rodrigo and Badajoz, and then advancing into Spain, defeated Marmont and the French at Salamanca (22d July, 1812), and occupied Madrid. In the autumn Soult, by able dispositions and a stronger force, compelled him to retreat again to Ciudad Rodrigo. The campaign had shown the weakness of the French occupation, while it had greatly lessened their resources and the part of the Spanish territory at their disposal.

1813.

War with Prussia. France still worshipped her chief. The new and severe conscription gave him another vast army; and he set forth to punish Prussia, which had declared war against him, in concert with Russia. The Germans always have honored this period of their history as a great resurrection, and as the birthtime of their true national life. The emperor passed through Mainz to Erfurt, and fought his first battle, a severe one, on the plain of Lützen; the defeated Prussians and Russians fell back in good order through Dresden, Napoleon following them hard, defeating them, and driving them out of their intrenched camp at Bautzen (20th and 21st May, 1813), whence they retreated again in perfect order. It was evident that the temper of Germany had entirely changed since Jena. An armistice, which followed, led to much negotiation at Dresden, where Napoleon's headquarters lay. The upshot of it all was that Austria joined Russia and Prussia, and the war went on. The attack of the allies on Dresden, which lasted two days (26th and 27th August), ended in their repulse and defeat; Russian supports came up in October, and it was plain that they were going to cut the French communications, and coop Napoleon up in Dresden for the winter. The king of Bavaria at this moment joined the allies, and made the emperor's position still more precarious. He now withdrew from Dresden, and near Leipsic came into collision with his enemies, who were waiting for him there. On the 16th of October, 1813, began one of the decisive battles in the world's history. Napoleon's forces were far outnumbered by those of the allies; and some of his German troops deserted in the thick of the fight. The battle raged on the 16th and the 18th; on the 19th Napoleon, completely defeated, began to withdraw. At Hanau he overthrew Wrede, and cut a passage for his army; the victorious emperors followed closely on his heels, and barely half his men reached home. The campaign had broken to pieces the dominance of France in Europe; and all the imperial creations, the confederation of the Rhine, the kingdom of Westphalia, the Batavian republic, came to an end. George III. resumed the electorate of Hanover; Austria recovered her lost provinces; in Spain the throne of Joseph Bonaparte fell, for the battle of Vittoria (21st June, 1813) had utterly destroyed the power of the French in the peninsula. Wellington drove them out of Spain, and in spite of the vigor and ability of Soult, the two great frontier fortresses of Pampeluna and St. Sebastian fell. Wellington entered southern France, and in November threatened Bayonne. Napoleon could only complain, with the tone of an irritated master, that he had been defeated by the treason of his servants, that is, of his German subjects.

The battle of Leipsic.

On his return to Paris, the emperor found the tone of feeling very much changed. In the legislative body men ventured to denounce his rule: such outspoken words had not been heard for years. He angrily replied with his "l'état, c'est moi," "to attack me is to attack the nation," and abruptly closed their session. Henceforth he would rule alone, and alone with the ruins of his armies face the terrible invasion that was coming on. The whole conditions of his warfare changed; he must now act on the defensive, and bear to see France trodden under foot, even as France till now had trodden all Europe under her feet. The allies came in almost without resistance in three armies,—the Austrians from Basel advancing to Langres; Blücher with the Prussians crossed the Vosges to Nancy; the army of the north, Russians and Prussians, came down to Namur, and thence to Laon. In all there were full 200,000 of them, a force quite double that at the emperor's disposal. They all sat on the inner slopes of the mountains which form the northern, north-eastern, and eastern defences of France, awaiting the moment to advance. Napoleon had the one great advantage of the inner line. But after fighting the severe battle of Arcis-sur-Aube, he tried to paralyze the allies by striking at their communications, and so lost his one advantage; for they, instead of hesitating, marched boldly on for Paris, defeated Mortier and Marmont in the very suburbs, and forced the proud capital to surrender before Napoleon could come up to its defence. The allied emperors were received with cries of "Long live the king," "Long live the emperor Alexander.' A provisional gov-

The invasion of France.

1814-1815. ernment of senators decreed the downfall of Napoleon; the other constituted bodies followed; the imperial government was swept away as in an instant. The emperor, amazed at this sudden impulse of the country, abdicated (6th April, 1814) on behalf of his son, and finally (11th April) he abdicated completely, offering himself, as he said, a "personal sacrifice" to France. His titles, honors, an ample income, and the island of Elba in full sovereignty, were left to him.

Louis XVIII. The restoration of the Bourbons followed at once. Louis XVIII. appeared in Paris, the protégé of foreign bayonets, and not ashamed to own that he owed his return to English help. Peace followed at once; France shrank back to her old dimensions, as she had been in 1792, with some slight modifications. Louis XVIII. lastly promulgated a new charter, granting some constitutional rights to his subjects. The document was dated as of the 19th year of his reign, as though Napoleon and the Revolution had never been. The peerage was restored, its numbers now unlimited except by the king's will, who alone could appoint peers; a chamber of deputies, elected by a limited suffrage, had really but little power, as the king reserved to himself the initiative of all laws; the Roman Catholic religion was declared the faith of the state, and full toleration granted to all dissidents. This was the constitutionalism of the reaction. It showed how far France had travelled from the days of the old régime. There was no question of ancient privileges or of feudal usages; the very name of States-General had disappeared. No reaction, however severe, ever brings things back to the point from which they had drifted; France could never again be what she had been under Louis XIV.

The return of Napoleon. A congress at once assembled at Vienna, under Metternich's presidency, with a view to a peaceful resettlement of Europe. It was, however, suddenly turned to warlike thoughts by the startling news that Napoleon, leaving Elba, had landed near Cannes (1st March, 1815). He appealed to citizens and soldiers alike; he appealed to the people; he spoke only of peace and liberty, and a popular constitution.

The Hundred Days. The army at once saluted him again as its emperor; France with a spontaneous plébiscite restored him to his throne, and Louis XVIII. fled to Ghent. Napoleon entered Paris amidst delirious transports of delight. Cooler reflections soon followed, when the declaration of the allied sovereigns was heard, and troubles began in the old royalist districts. Nor were men better pleased when it was seen that Napoleon returned at once to his old despotic manner of governing; signs of alienation showed themselves; the allied armies drew towards the frontiers of France. Blücher, with his Prussians, came down to join Wellington, who had landed in Flanders, and Napoleon hastened up to prevent their union. He sent Ney to encounter and check the English, while he himself tried to destroy the Prussians. He found them at Ligny, where, on June 16, 1815, he defeated them, though Ney was unable to force Quatre Bras, so as to be ready to fall on their flank and complete the rout. The consequence was that Blücher drew off his army unbroken to Wavre; and Wellington, to keep near him, also fell back to the village of Waterloo, where he could both cover Brussels and await the Prussians. There, on the 18th of June, 1815, took place the battle of Waterloo, in which Napoleon and Ney made their final effort for the empire. The object of Wellington was to hold his ground till Blücher could come up; the object of Napoleon was, by detaching Grouchy[1] towards Wavre, to hinder the Prussians, till he could crush the English. Grouchy, however, let himself be deluded by a single Prussian corps, while Blücher slowly made his way towards Waterloo: and Wellington's Englishmen and Germans, with heroic tenacity, had held their ground against all attacks. In the afternoon the Prussians began to come up, and after the repulse of the French guards towards evening, Napoleon knew that all was lost. He entrusted his shattered army to Soult, and fled headlong to Paris. There, finding hope all gone, he once more abdicated, on behalf of his son. He withdrew to Rochefort, hoping to find means of escaping to America; but the English cruisers rendered this impossible, and he threw himself on the generosity of his hated foes. He was taken on board the Bellerophon, and conveyed as a state prisoner to the island of St. Helena, where he lived, the mere shadow of his former self, in a hated and inglorious ease, till death released him in 1821, at the age of fifty-two. 1815.

The character of Napoleon. There is a saying attributed to Talleyrand, which hits the prominent characteristics of Napoleon's nature: — "What a pity that so great a man was so ill brought up!" For he had genius and no breeding; he never shook off the adventurer-element in his life; nor had he that high sense of honor, truthfulness, and gentleness, which go with true nobility of soul. With a frame of iron, Napoleon could endure any hardships; and in war, in artillery especially and engineering, he stands unrivalled in the world's history. His quick intelligence was altogether scientific in the colder and harder aspects of scientific knowledge. He took no interest in moral sciences or history, or the brighter works of imagination. Throughout we discern in him the precisian, the despot on exact principles. Even when he unbent among his intimate friends, his was "a tyrant's familiarity," with a touch of Oriental ferocity under it. He was ever on the watch against rivals, ever full of distrust, treating great men with a false and feline grace of manner, which seemed to be expecting a surprise. No one was ever so naturally untrue as he; he never hesitated to lie and to deceive; the most important despatches he would readily falsify, if he thought there was anything to be gained by it. There was in him a swiftness of intelligence which answered to his hot and passionate nature; the true and solid balance was wanting. He could not rest, and knew not when he had achieved success. And this was immediately connected with another Oriental quality, his vast and unmeasured ambition, and the schemes and dreams of a visionary, which led him to the greatest errors of his life,— his expedition to Egypt and his hopes of an Eastern empire, and his terrible attack on Russia. The same largeness of vision showed itself in his endeavors to reconstruct the map of Europe, and to organize anew the whole of society in France. He could have in his mouth the phrases and cries of the 18th century, and with them he knew how to charm mankind. Yet with this gift, and with his amazing power of influencing his soldiers, who sacrificed themselves in myriads for him with enthusiasm, there was a coldness of moral character which enabled him to abandon those who had given up all for him, and made him show shameless ingratitude towards those who had done him the greatest services. We can gauge a man's character by his complaints against others, for those complaints are always the reflection of his own characteristics. Napoleon was ever inveighing against the deceit of Alexander, the treachery of the Germans, the perfidy of Pitt, the warfare of savages which he had to face; and the phrases represent the worst elements in his own character. He was, in fact, the successor and representative of the "18th century despots," the military follower of the Pombals, the Arandas, the Struenzees of the past. He had their unbalanced energies, their fierce resistance to feudalism and the older world, their ready use of benevolent and enlightened phraseology, their willingness to wade through blood and ruin to their goal, their undying ambition, their restlessness and revolutionary cagerness to reorganize society. Like them, with well-sounding professions, he succeeded in alienating the peoples of Europe, in whose behalf he pretended to be acting. And when they learnt by bitter experience that he had absolutely no love for liberty, and encouraged equality only so long as it was an equality of subjects under his rule, they soon began to war against what was in fact a world-destroying military despotism. When the popular feeling was thoroughly aroused against him in Spain, in Germany, in England, his wonderful career was at last brought to an end.

VII. The Restoration.

The royalist reaction. While Napoleon had held together the enthusiasm of the French army, and had flattered the national vanity, and had raised a bulwark between the peasant tiller of the soil and his ancient oppressor, the Bourbons came back, having learnt nothing, and under auspices painful to French feeling. The peasant suspected them of wishing to restore noble privilege with the ancient throne; the army was suspicious if not hostile; the national feeling was vexed by the patronage of the victorious hosts of Russia, England, and Germany. Paris was treated by them as a conquered capital, the whole country was garrisoned by their armies, and Louis XVIII. was little but their instrument and dependant. The royalist reac-

[1] [Emmanuel Grouchy (1766–1847), marquis, served under Hoche, Joubert, and Moreau, distinguished at Friedland and Wagram and in Russian invasion, marshal in 1815, fled to America, returned in 1821, and became a peer of France.—Am. Ed.]

1815-1824. tion was violent, though not cruel; the new legislative chambers proved vehemently Legitimist; Fouché, who had hitherto successfully held his ground, come who might, in his dangerous department of the police, now fell and was exiled; Talleyrand also was got rid of; and the duke of Richelieu, grandson of that hoary old sinner who had been at the right hand of Louis XV., became chief minister. Meanwhile, the congress of Vienna had at last (20th November, 1815) dictated its terms of peace to France. The "Holy Alliance," of the emperors of Russia and Austria and the king of Prussia, that league of monarchs against the liberties of Europe, compelled France to pay a huge indemnity, to surrender her Rhine fortresses of Philippeville, Sarrelouis, Marienburg, Landau, and Huningen; the frontier of France was to be garrisoned for five years by a foreign army commanded by a foreign general, and paid by France; this period was cut short in 1818 at the Congress of Aix-la-Chapelle.

The Holy Alliance.

Louis XVIII., who was no mere reactionary, allowed little blood to be shed; Labédoyère, who had led the army in its rally round Napoleon in 1814, and Marshal Ney were the only victims. Murat, taken in an attempt to recover his throne of Naples, was shot by the Italians.

New arrangement of parties.

As the chamber of deputies seemed determined to push the reaction to its utmost limits, Louis XVIII. dissolved it, and, declaring that he would rule constitutionally in accordance with the charter, rallied round himself all the moderate party, headed by the duke Decazes. Power came now into the hands of the middle classes, and in 1818 the burgher party ruled. It was supported by the newly-risen *Doctrinaires*, men who wrote for the press, and began the modern career of French journalism. The chief of these were De Barante, Guizot, and Villemain; on one side of them were the extremer royalists, headed by the count of Artois; on the other side stood the new party of the *Independents*, from whom sprang the men of the "three days of July." Between these Decazes kept up the new "système de bascule," the balance-system, as it was called, allowing now this side and now that to taste the sweets of power, and to make some pretence to party-government. In 1820, however, the murder of the duke of Berri, second son of the count of Artois, gave the ultra-royalists an excuse for freeing themselves from a man who kept them somewhat in order.

The efforts of the reactionists.

Using the excitement caused by the assassination, they compelled the king to dismiss his favorite minister, and seized the reins of power. They at once modified the constitution in such a way as to secure their majority in the chambers, and prepared to carry matters with a high hand.

Just at this time the extravagant conduct of the reactionary Bourbon princes of Spain and Italy had aroused insurrection and armed resistance everywhere. The people of Spain and Naples declared against arbitrary government, and were at once attacked by those "champions of order," the sovereigns of the Holy Alliance. At their bidding Louis XVIII. also declared war against Spain; the French Government, being now entirely guided by the count of Artois, was thoroughly in harmony with all that was repressive and reactionary in Europe. In the spring of 1823 the French army, commanded by the duke of Angoulême, the eldest son of the count of Artois, crossed the Bidassoa and entered Spain. No serious resistance was met with except at Cadiz, and the triumph of the French arms was mercilessly used to crush the Spanish liberties. Ferdinand VII. of Spain returned to Madrid, and ruled henceforth as most absolute, most Catholic sovereign. The duke of Angoulême was thought by his success and personal bravery to have aroused in the French army an enthusiasm for its old Bourbon masters; reaction ruled supreme in France; the Jesuits were conspicuous in their delight; and the system of influences, corruption, and manœuvres, so long the disgrace of French elections, sprang at once into full bloom.

Character of Louis XVIII.

In September, 1824, Louis XVIII. died, with his last breath urging the count of Artois to rule prudently and in accordance with the charter. He was one of the best of the Bourbons, a man of ability and learning, fond of literature and science, moderate and loyal in opinion and act,—a far better man than those who surrounded his old age, and drove him into reactionary courses which he could not approve. His successor, the count of Artois, was a very different man. He had been the chief cause of the misfortunes of the monarchy in the Revolution, and had both the fine manners and the faults of the old régime. He was the fourth son of the dauphin, and brother of Louis XVI. and Louis XVIII., and now became king under the title of Charles X. It was speedily seen that now the ultra-royalists would have none to check them; the new monarch was bigoted, stupid, ignorant; from the scandals of his early life to the devotion of his later days there had been but a step; the sublime is not so near the ridiculous as superstition is to immorality. He was regarded as a mere tool of the Jesuits, and his reign was but a struggle against the more liberal instincts of his country. Now, if ever, it was seen that the old Bourbons "could never learn and never forget." In 1827, the national guard, which had shown itself too free in its cries, was disbanded; a new chamber of deputies was, in spite of all efforts, strongly opposed to the policy of the king's Government; a more moderate cabinet followed.

1824-1830. Charles X.

In this year England, France, and Russia joined to put a stop to the quarrel between Turks and Greeks, and their combined fleet under Sir Edward Codrington won the battle of Navarino, and ruined the maritime power of Turkey (20th October, 1827). Early in 1828 the French occupied the Morea, and ere long the independence of Greece was accepted by the Ottoman Porte, and a new national life began in Europe.

War with Turkey.

In 1829, finding the new ministry too moderate for him, Charles X. dismissed it, and gave the seals to Prince Polignac. This meant war to the knife against all constitutional liberties in France, and was the return to power of all that Frenchmen most feared and disliked. The chambers, supported by popular feeling, stood firm, and carried an address to the throne, which declared that the new ministry did not enjoy their confidence. Thereupon the chambers were dissolved, and the fresh elections which followed were a decisive struggle between liberty and despotism. The success of the expedition to Algiers, in which France vindicated her honor by the capture of the robber-city and the complete defeat of the dey, while she acquired for herself her most flourishing and important colony, brought no relief to the Government in its contest against the people. The new chamber was stronger against the ministry than the late chamber had been. Then Charles X. suddenly attempted the usual *coup d'état*, and assumed a kind of provisional dictatorship, which produced at once the five famous ordinances of St. Cloud (25th July, 1830). These were—(1) the suspension of the liberty of the press; (2) the dissolution of the new chamber of deputies; (3) a new system of election, so as to secure absolute power to the king; (4) the convocation of a new chamber; (5) some ultra-royalist appointments to the council of state. At this time a young journalist from Marseilles, Thiers, was editor of the *National*; under his fearless leadership the "fourth estate" made its first collective revolt against illegal power, and signed a vigorous protest against the ordinances. It is the beginning of that wholesome influence of the press on modern politics of which the history has yet to be written, because its limits have not yet been reached. Men waited breathlessly to see what steps would follow such an insurrection of opinion against power. On the 27th of July it was announced that Marshal Marmont, although he disapproved of the measures agreed on, and did not sympathize with the five ordinances, had been charged with the defence of the capital. Then insurrection broke out at once, and the "Revolution of the three days of July" began. On the 27th the barricades raised by the citizens were forced and the streets cleared; on the 28th the insurgents, not abashed by their defeat, seized the Hôtel de Ville, and hoisted the tricolor. Marmont, who urged pacification, was ordered by Charles, who kept out of the way, to crush all opposition ruthlessly; before evening his troops had retaken the Hôtel de Ville, and most of the important positions. Again he urged moderation on the king, and the leaders of the revolt offered to lay down arms if the ministers were dismissed and the five ordinances withdrawn. Charles, however, would listen to nothing, and sent orders to Marmont to persevere. On the 29th, however, two regiments fraternized with the people; and Marmont, paralyzed by their defection, and by suspicions as to the fidelity of

1830. other troops, gave way. The populace rushed into the Louvre and the Tuileries, sacking and destroying the insignia of Bourbon power. They neither stole nor murdered. Charles X. at St. Cloud now offered all he had refused the day before; of course it was a day too late. Paris had triumphed over the reaction, and the unteachable older Bourbons had to go. The veteran Lafayette was once more named chief of the national guard;—how much had France seen and done since he had first girded on that same sword! The tricolor flag and cockade reappeared everywhere. Thiers and Mignet issued a proclamation, urging the Parisians to transfer the crown of France to the duke of Orleans, who came up to the capital at once, and declared his ready acceptance of the office of lieutenant-general of the realm. In his first address he assured France that thenceforward the charter should be a reality. On the 2d of August, 1830, Charles X., finding that the army had deserted his cause, and that necessity was on him, abdicated in favor of his young grandson Henry duke of Bordeaux, son of the duke of Berri; the dauphin, who was childless, also renounced his own claims on behalf of his nephew, who was then ten years old. This last representative of the older Bourbons, the last hope of the legitimists of France, lives still, cherishing his claims, and known to modern history as Henry, count of Chambord. Charles withdrew to England, where he died in 1836.

Charles X. abdicates.

The count of Chambord.

The day after his abdication Louis Philippe, duke of Orleans, the representative of the Orleans branch of the Bourbons, son of Philippe Égalité, and great-great-grandson of the Regent Philip, opened the session of the chambers as lieutenant-general of the realm. The charter was carefully revised in a liberal direction, and the crown was offered to the duke and his heirs-male with the title of "King of the French." On the 9th of August, 1830, the new constitutional monarch, ruling, not by divine right, nor by territorial possession, but by the will of the sovereign people, "king of the French," not "king of France,"[1] king of the tricolor, not of the lilies and the white cockade, took oath faithfully to observe the amended charter. The era of constitutional monarchy seemed at last to have begun in France; men thought that the fires of the Revolution had died down, that republicanism was discredited, while the follies of the older Bourbons, on the other hand, had been shown to be no longer possible. "The days of July" were hailed as heralding a new epoch of moderate politics; the "citizen-king," who had carefully shunned the reactionary party, and was by family tradition head of the liberal branch of the Bourbons, should lead France along a new course of decorum and material prosperity. It should be the reign, not of noble and priest, nor of grim artisan and sans-culotte, but of broadcloth burgher, a rule of common-sense and constitutional use. Lafayette, who in these later days had sided much with carbonari and republicans, was greatly blamed for lending the support of his name to any monarchical system of government. His excuse lay in his belief that, for the time at least, the republicans were but a small minority of the people. The events of subsequent years seemed to prove him right; yet in the end the stronger beliefs and energies of republicanism were fatal to the throne. Peace at home and abroad, and a constitutional government, allied with such countries as also enjoyed the blessings of a moderate form of polity, especially with England,—these were the chief aims of the reign, as it was worked out by the two antagonistic statesmen, the rivals Thiers and Guizot.

Louis Philippe succeeds.

The new constitutional government.

This revolution of the "three glorious days of July" was a part of a general movement throughout a large part of Europe; for men were weary of the triumphs of reaction. In England these were the days of the Reform agitation which is indissolubly connected with the name of Earl Russell. In Belgium the news of the three days led to a violent insurrection, and the Belgians, who hated the union with the Dutch, threw them off and declared themselves independent; they bestowed a constitutional crown on Prince Leopold of Saxe-Coburg. When the Dutch refused to deliver up Antwerp and let the Scheldt run free, England and France combined to help the young kingdom; a strong French army soon forced the Dutch to evacuate Antwerp citadel.

Changes in Europe.

[1] It is a mistake to lay stress on this change of style. In the *Acta Pacis Westphalicæ* (1648) even Louis XIV. is actually styled "Roi des François," not "Roi de France."

1830-1840.

At home the country was still uneasy; both legitimists and republicans were anxious to embarrass the Government. There were troubles in Paris, at Lyons, at Grenoble, and in La Vendée, where the romantic duchess of Berri kept up the hopes of the old Bourbon party. After a time the Government succeeded in capturing her, and then it came out that she had been for some time secretly married to an Italian gentleman; this, and the birth of a daughter, discredited the legitimist cause completely; the duchess was allowed to retire in peace to Palermo. The disturbances at Paris and Lyons were also put down, and their chief instigators punished. After this the efforts of the dissatisfied took the form of attempts at assassination, and this in turn led in 1836 to the passing of the Laws of September, which treated press offences with severity, and regulated strictly the procedure of the law-courts. In this period could be seen a more marked divergence of parties, even among the Orleanists themselves. On the one hand there were the more conservative or reactionary men; on the other the upholders of the English theory that "the king reigns, but does not govern." At first Louis Philippe had chosen his Government from the former party, which, at the beginning of the reign, had embraced not only Casimir Périer, the head of the Government, but Guizot, Thiers, and other men of name in politics and literature. Casimir Périer, vigorous in combat, but not a large-minded statesman, was carried off in 1832 by cholera, then raging fearfully in Paris; and soon after that time the life-long feud between Guizot and Thiers began. A series of Governments followed one another in quick succession, and without stability; at last the cabinet, headed by Marshal Soult, having proved unable to hold its own, a new ministry followed, of which Thiers was the head (February, 1836). The ambitious little statesman, with the fire and heat of the south in him, advocate, newspaper editor, historian, and politician, seemed now to have reached his goal. His ministry, however, lasted but a very few months. He wanted to interfere in the affairs of Spain, while the king refused to change his policy of non-intervention; the cabinet broke up, and Count Molé, with Guizot as minister of public instruction, succeeded. The new Government had to face the anger of France at the failure of French troops in Algeria before the hill-fort of Constantine, and the agitation which succeeded the strange attempt (October, 1836), of Prince Louis Napoleon to arouse imperialist echoes among the troops at Strasburg. Though, when he showed himself and read a proclamation to the soldiers, many replied with shouts of "Vive l'Empereur," the bulk of the troops refused to listen, and he was arrested with his companion, a M. Persigny, and sent on to Paris. The Government treated him leniently, and allowed him to leave France for New York. In 1838 Count Molé, finding the state of parties very uneasy, dissolved the chambers, and fresh elections followed. There had been four chief parties in the Assembly,—the Right, led by the famous conservative lawyer Berryer; the Right Centre, under guidance of Guizot; the Left Centre, headed by Thiers; and the Left, led by Odillon-Barrot, formerly president of the society "Aide toi, le ciel t'aidera," an association formed to advance purity and freedom of elections, and a chief motive-power in the revolution of July. This last party, till 1840, was in constant opposition to Government. It was felt that the king, who was obstinate in his opinions, and not very scrupulous, had for some time past been interfering more than was wholesome in electioneering matters; the system of help to official candidates, the snare of French politics, took large development under him. The elections resulted in a majority for Molé and the Government. The other parties, however, made a coalition against him, which, under the leading of Thiers and Guizot, overthrew the ministry in 1839. The parties, however, did not agree well after their victory; the king was not cordial with them, and chose his ministers so as to exclude the three victorious leaders. In 1840 the king's friends were again defeated. Thiers again became chief minister, and Guizot was sent as ambassador to St. James's, where he had a very difficult part to play, in consequence of the state of the Eastern question. The rebellion of Mehemet Ali, the

Eastern affairs.

1840-1847. able viceroy of Egypt, against the sultan had aroused no small excitement in Europe. Mehemet was well known in France, where his adventurous career had attracted much attention. Though the French and their allies had destroyed his fleet at Navarino in 1827, he had since (1831–1833) acquired the government of Syria as well as that of Egypt, by the energy of his son Ibrahim Pasha. When the sultan in 1837 endeavored to reduce his power, he again declared war against him, and Ibrahim once more defeated the Turks, securing Syria for his father. Now arose a great difference between France and England. The French Government wished that both Egypt and Syria should be finally guaranteed to Mehemet; the English Government declaring that such a step would be fatal to the Turkish empire, insisted that Syria should be, with some small exceptions, restored to the Porte. In July, 1840, England formed a quadruple alliance with Russia, Austria, and Prussia, without communicating at all with Guizot till after the treaty had been actually signed. Napier speedily bombarded and took Beyrout, while Stopford blockaded Alexandria. In one short campaign the Egyptians were easily cleared out of Syria, and Mehemet Ali, acquiescing in the power of the stronger, secured his position in Egypt, while he finally restored Syria to the Porte.

Irritation in France.

In France the irritation was extreme. The nation had watched Mehemet's regeneration of Egypt, a country in which, ever since Bonaparte's expedition, France had seemed to have a special interest; it was a great shock to her to see her diplomacy rudely foiled, her sympathies neglected, her strength unemployed. The restoration to France in 1840 of the ashes of Napoleon, a rash act due to Louis Philippe himself, woke many a slumbering echo of the old national pride; Napoleon, it was urged, had never let his country fall, as the present Government had done, out of the foremost place in the councils of Europe. The second attempt of Louis Bonaparte to win over the garrison of Boulogne, in spite of the absurdities of the tame eagle, and the utter failure of the venture, added not a little to the popular uneasiness. By shutting up the adventurer in the castle of Ham, the Government made him a martyr, and roused much dormant sympathy for him. The ministry accordingly fell, and Guizot, under the nominal presidency of Marshal Soult, became the real head of the new Government. The step was far from allaying the strong feeling in France; men accused Guizot of having played the country false while in London; his bitter antagonism to Thiers seemed to them to be the cause of the humiliation of France. For the moment, however, the only result was the fortification of Paris, which was begun in 1841.

Fortification of Paris.

The Pritchard affair.

The annals of France were now tranquil, under the cold administration of Guizot; party spirit seemed to have died down; the "Pritchard affair," arising out of the occupation by France of Otaheite, in accordance with a treaty in 1842, aroused again the slumbering irritation between France and England. The English Government had not objected to the treaty between Queen Pomare of Otaheite and the French Government; Mr. Pritchard, however, consul, missionary, and medical man to the queen, believing that the treaty was bad for the natives, had succeeded in persuading Queen Pomare to repudiate it, and to call on England to support her. Thereon in 1844 the French arrested him, sent him back to England, and occupied the island as its protector. The success of the French arms in Africa also angered the English; Marshal Bugeaud had vigorously attacked and punished the emperor of Morocco for giving refuge and support to Abd-el-Kader, and the defeated emperor was obliged to sue for peace (September, 1846). In 1847 Lamoricière succeeded in capturing the picturesque chieftain who had caused France so much trouble, and sent him as a prisoner to France. Lastly, the vexed question of the Spanish marriages, in 1846, in which Louis Philippe succeeded in reallying the Bourbons of France and Spain by a double marriage, caused very strong feeling in England; it was felt that Guizot had broken his word in the matter, and that France was taking unfair means of avenging herself for the affront of the quadruple alliance of 1840.

The gloomy outlook in 1847.

So things stood when 1847 opened with gloomy aspects for the French Government: irritation, want, the feeling that the Government had done little to lessen the commercial and agricultural distress; the desire of a more popular and perhaps more brilliant rule; the distrust of Guizot's policy, as shown in the risks of the Spanish marriages, by which he had endangered the peace of France for the sake of illusory dynastic advantages; the consciousness that the king's feelings were not friendly to the people, that his government was selfish, and that he did not hesitate to use corruption and influence in elections,—these things all made affairs seem unsettled and precarious. Guizot's policy in the affair of the marriages, in his support of the Swiss Sonderbund, which was the resistance of reactionary against popular principles in Switzerland, his appeals to the treatics of 1815, his friendly attitude towards Metternich and Austria, his divergence from the liberal views of Lord Palmerston, his dislike for the patriots of Italy, shocked and alienated all liberal opinion in France, and made the minister completely unpopular. The rôle of prudence at home and peace abroad, never an heroic one, had been abandoned by Guizot for a system which endangered peace with the neighbors of France and irritated the passions of party at home. Trickery and subterfuge seemed to rule in high places.

1847-1848.

Guizot's unpopularity.

VIII. The Second Revolution.

The agitation of the country at first was seen chiefly in speeches made at fervid banquets. When the session of 1848 opened, the opposition, led by Odillon-Barrot, showed itself strong and resolute; the interference of Government against a popular banquet in Paris led to the outbreak of the Revolution (22d February, 1848). On the 23d the national guard took part with the populace against the troops, and the soldiers, unwilling to attack them, hesitated, and the day passed by. Guizot now yielded, and sent in his resignation; it was, however, too late; that evening, the troops having fired on and killed some of the mob, a ghastly procession with the bodies of the slain passed through the streets. The excitement redoubled; the troops refused to act; Louis Philippe even called on Thiers to form a liberal ministry with Odillon-Barrot. A proclamation was issued stating that the troops were ordered to withdraw. Forthwith the regular soldiers laid down their arms, and the people with the national guards marched on the Tuileries. Louis Philippe now abdicated in favor of his grandson the count of Paris, and, assuming the name of Mr. William Smith, closed an inglorious reign by an inglorious flight in a hackney cab. He reached England, and died there in peace some two years later. Writers have called the Revolution of 1848 a mere trick, and have wondered how so mean an effort could have overthrown a constitutional and organized government. The truth is that France was weary of such a rule, that Paris wanted a republic, and that in the country generally the citizen-king was unpopular. In the chamber of deputies the republican party at once took the command, and established a provisional Government, which immediately proclaimed a republic, to be ratified by a popular vote; to be based on the sovereignty of the people; to re-echo the old watchwords, "liberty, equality, fraternity;" to secure a pure and liberal administration. The presidency of the new Government was given to Dupont de l'Eure; Lamartine had the portfolio of foreign affairs; Cremieux, justice; Ledru-Rollin, the home-office; Arago, the admiralty; Bédeau, the army; Carnot, education; Bethmont, trade; Garnier-Pagès was named mayor of Paris; Louis Blanc, and three others, were first named as secretaries, and soon after became actual members of the Government. The decree which established the tricolor flag, with a red rosette, indicated, as trifles often will do, the position taken up by the new administration. They would not accept the red flag of the Parisian communists, which Louis Blanc wished to take as symbol of a thorough republicanism; they added the red rosette to express a certain sympathy with that side; they kept the tricolor as the flag of the old Revolution. One step—and it was a great blunder—they did make under the influence of Louis Blanc: they issued a decree promising to provide work for all,—promising in fact to suspend the first laws of political economy on behalf of the working man.

The revolution of 1848.

The republic of 1848.

Though the revolution had been a thorough Parisian surprise at the moment, all France was ready to accept it. From every side cheerful acquiescence came in; the army approved; the clergy were guided by the liberal archbishop of Paris, M.

The republic at once established.

1848-1852. Affre, who three months later lost his life in the sacred attempt to stay bloodshed in the streets of the capital; politicians either were silent or joined the Government; the adventurer of Strasburg and Boulogne, who had escaped from Ham in 1846, offered his services to France, and was politely sent back to England. In April the elections to the new constituent assembly took place. They returned a body of, on the whole, moderate republicans, not favorable to the extremer views of Paris, and appointed an executive commission of five members, Lamartine, Arago, Garnier-Pagès, Marie, and Ledru-Rollin. A serious outbreak was easily quelled in May; in June, however, things took a more alarming turn. The reaction, which had already begun in France, was supported by the conviction of moderate men that the "national workshop" system, a practical socialism, was too burdensome for the finances of the state, and that the country generally would not long subsidize the Parisian artisan. A decree ordering a portion of the working men to be enrolled in the army led to the terrible revolt of eastern Paris. The Government declared the town to be in a state of siege, and entrusted General Cavaignac with a dictatorship. For four days the battle of the barricades raged; the artisans did not yield till the last barricade of the Faubourg St. Antoine had been stormed. Then Cavaignac laid down his dictatorship and was named president of the council, with right of naming the ministers. The national workshops were absolutely closed on the 3d of July, and thus the republic freed itself from the dictation of Paris. After the May disturbance the leaders of reaction had begun to pluck up courage, and to offer themselves for the elections; Thiers was returned for the Lower Seine, and became its political leader; Changarnier was its military chief. Louis Bonaparte was also among the elected. He veiled his ambition under popular phrases, and, as had been seen before, a Bonaparte made ready to pass into absolute power by an alliance with the people and a seeming deference to its sovereignty. "My name," he said, "is the symbol of order, nationality, and glory." The Assembly next proceeded to do its work as a constitutional body, and organized the Government thus:—A president of the republic, elected for four years, and then not re-eligible till after four years more; a council of state, named by the assembly for six years, and charged with the drafting of all public acts, and other honorable functions; a legislative assembly of 750 members. The date of election of a president was fixed for the 10th of December. The true republicans failed to support their man, General Cavaignac; they also left Lamartine entirely out, in spite of his honorable services. The instincts of the nation turned towards one who bore the charmed name of Bonaparte, and the prince-adventurer was elected by a vast majority of votes, nearly five millions and a half supporting him against less than one million and a half who voted for Cavaignac. Thus the "Napoleonic idea," strong in the country-places, prevailed over the moderate republicanism of the Assembly, and the wishes of the chief towns of France. The new president was formally proclaimed, and took oath of office on December 20, 1848.

Louis Bonaparte.

The revolt of Paris.

The new constitution.

Louis Bonaparte elected president.

His first acts.

The first act of the new Government was the overthrow of the republic of Rome, and the military restoration of Pius IX. By this the president declared himself hostile to all the liberal movements of Europe, and won the firm gratitude and allegiance of the Catholic clergy of France. Before Louis Bonaparte had been in office a year, it was seen that he was preparing to move in the direction of absolute power. Stormy debates in the Assembly took place; a law was passed limiting the suffrage, as it was seen that in the existing temper of the country the ignorant peasant-vote was at the mercy of adventurers. Discussion also followed as to a revision of the constitution of 1848. At last, on December, 2, 1851, the prince-president, guided by a group of friends and brother-conspirators, ventured on his famous *coup d'état*, and swept away the whole existing fabric of the constitution. In the most lawless manner sixteen prominent members of the Assembly were arrested, among them Cavaignac and Thiers; the Assembly itself was forcibly dissolved, universal suffrage restored, and a *plébiscite* on the new form of government was appointed to follow at once; the capital was placed in a state of siege; the council of state dismissed. A new ministry was also formed of the chief members of the successful conspiracy,—Morny for the home-office; St. Arnaud for war; Fould, finance; Rouher, justice. A project for a tenure of the presidency for ten years, with ministers responsible only to the president, a council of state to draft and prepare laws, a legislative body, and a conservative senate,—this was the new constitution of 1852. It was clearly a reminiscence of that form of government which led to the first empire. Outbursts of despairing resistance in Paris were sternly put down, with brutal severities, which aimed at striking terror into the capital; the men round Louis Bonaparte did not want for vigor; they had won power by conspiracy, and did not hesitate to keep it by a massacre. The new constitution was accepted by an overwhelming majority; it seemed as if the Napoleonic idea was omnipotent in France. The new government was, like that of the great Napoleon, the union of strong and arbitrary rule with an appeal to the ignorant passions of the populace. The burgher world acceded to it, because it was strong, and promised order and hopes of material prosperity, and because it was scared and puzzled by the fitful appearances of the "red spectre" of eastern Paris.

The *coup d'état* of 2d Dec., 1851.

1852.

Constitution of 1852.

Little trouble did the successful party take about the remaining step. The high tide of the popularity of Louis Bonaparte was still running up in flood; and in November, 1852, an almost unanimous vote (7,824,129 against 253,149) accepted him as hereditary emperor of the French under the name of Napoleon III. Before the end of the year he made solemn entry into Paris.

Napoleon III.

IX. The Second Empire.

The second empire lasted from November 4, 1852, to September 4, 1870, a period of nearly 18 years. It was openly modelled on the first empire, and Napoleon III. never forgot that he was his uncle's nephew. His mother, the ex-queen of Holland, was Hortense Eugénie de Beauharnais, daughter of the empress Josephine by her first husband, the viscount Alexandre de Beauharnais; the emperor married her to his brother Louis Bonaparte in 1802; and her son Louis was born in 1808 He was now forty-four years of age, a man of no dignity of moral character, ambitious and unscrupulous, but somewhat wanting in nerve; far better than the adventurers who surrounded him; a man of very considerable clearness of vision, who did his utmost to develop the home-prosperity of France, by sweeping away the barriers which wrong-headed Governments had placed on commerce, and by introducing the new doctrines, strange to French ears, of free trade, which he had learnt to admire by seeing their applications in England. His government was frequently, almost incessantly, involved in wars; yet the emperor himself was doubtless sincere in proclaiming his wish for peace. "The empire," he said, "menaces no one; it desires to develop in peace and full independence the vast resources it has received from heaven." It is but one of the inevitable results of a bad tradition that he, like his predecessors, hoped to succeed in securing prosperity to France by constant interference and by making the nation feel the presence at its head of an irresponsible yet beneficent master. At the same time this ostentatious activity assured labor to the restless artisans of the great cities; towns were half rebuilt; Paris especially, felt this malign benevolence, which, while it fed the workman, made him destroy his own means of resistance to government,—for the rebuilding of Paris by Haussmann was planned so as to drive great and straight military roads through all the disaffected quarters of the north and east. Railways, canals, harbors, public buildings, above all, new churches and old, owned the imperial hand. If, as must be granted, this lower empire was based on popular ignorance and plentiful bloodshed and terrorism, both in Paris and in the provinces, it must also be conceded that the emperor himself, dreamer as he was, was heartily anxious for the welfare of France. He was unfortunate in his associates, and perhaps also in the beautiful lady he chose as empress.

The second empire.

Character of Napoleon III. and of his reign.

When the second empire began, the sovereigns of Europe thought that republicanism was gone for ever; they recognized the new government of France with some cordiality. England came first—for in England the unmistakable ex-

1852-1856 pression of the popular will was regarded just as the result of a general election at home might have been; the vote of the people had expressed their wishes clearly, and England was ready to accept their views as to their own affairs. It was noticed that Prussia was unfriendly towards the new government; and when the emperor, anxious to secure the hereditary succession promised to him by France, looked round him for a wife, his proposal to wed a Hohenzollern princess met with a marked rebuff. He had before failed to win a Swedish princess; he finally chose for himself the handsome Eugénie de Téba, a Spanish lady, who had already been conspicuous for her beauty at his court. France was divided in mind respecting her; her appearance won men's hearts; the national vanity was vexed at the rebuffs, while it was pleased to say that the emperor had disdained royal and formal alliances in order to choose the lady after his own heart; and lastly, there were not a few who grumbled that he ought not to have slighted the ladies of France by selecting a Spaniard. Anyhow, the young empress bore him a son, the prince imperial, on whom rested all the hopes of the new dynasty. For the rest, her extravagant and frivolous tastes in dress and habits set a very bad example to a nation far too willing to copy it; and her influence and advice were invariably on the unlucky side. She was a devoted Catholic, and to her counsels are due some of the worst mishaps of the reign.

Marriage of the emperor.

The Crimean War.

In 1854 began the first war of the second empire,—the first denial to the famous utterance of Bordeaux in 1852, "L'empire, c'est la paix," which had enlisted the warm partisanship of commerce and finance. The large and ambitious schemes of the czar Nicholas against Turkey, "the sick man" of that day, alarmed all Europe; the dispute between Russia and the Porte as to the holy places was referred to a conference at Vienna, which proposed to solve the difficulty on the lines of the treaty of 1841, which had placed Turkey under the guarantee of the five great powers. Before diplomacy had got to work the Russians had invaded the Turkish territory; the Anglo-French fleet had moved up to Besika Bay, to be within call of Constantinople, and the Russian fleet (30th November, 1853) had destroyed the Turkish ships at Sinope. War, however, did not openly break out till the next spring. In April a treaty of alliance was signed between France and England, who were afterwards joined by the king of Sardinia, while Austria and Prussia also guaranteed the possessions of each other; the imperial guard was re-established, and an army of 60,000 men, one-third English, two-thirds French, set sail for the Black Sea. After halting first at Gallipoli, then at Varna, the allied fleets and armies set sail for the Crimea, and landed under protection of the ships near the mouth of the river Alma. Thence they marched along the coast towards Sebastopol, and came on the Russians strongly posted on the left bank of the Alma; on the 20th of September, 1854, the allies defeated the Russians there and took their position. Mentschikoff, who commanded them, withdrew into Sebastopol, round which the allies marched, taking up their quarters not far from Balaclava, to the south-east of the great fortress. Then began a siege which lasted through the winter; on October 25 the Russians were repulsed at Balaclava itself, by the wild charge of the English cavalry; on November 5 the allied armies won the battle of Inkermann, in which the English, who were defending the points attacked, bore the chief brunt of the fighting. It was not till June that the bombardment of the allies was effectual in producing the fall of some of the outworks. Sebastopol eventually fell on the 10th of September, in consequence of the storm of the Malakoff tower by the French troops. The French and Russians had now done enough, and the war speedily came to an end. The English would willingly have gone on till they had ruined the Russian navy; the emperor of the French was glad to be done with it. In 1856 the czar Alexander, who had succeeded Nicholas in the winter of the great siege, signed a treaty of peace, the terms of which had been agreed on at the Congress of Paris. The Black Sea and the Danube were neutralized; the Danubian principalities taken, in part at least, from under Russian protection; the sultan was admitted to the council-board of Europe. The peace did little for the real good of France, created a cold feeling between her and England, annoyed Prussia, and did not satisfy Austria. The war had not been very brilliant; the losses had been heavy; the appearance of Count Cavour at the congress had forecast the coming events of 1859.

The peace of Paris.

1858-1859.

The Orsini attempt.

The attempt of Orsini on the emperor's life in January, 1858, led the way. A man who had been among the carbonari, and had handled the explosive substances which lay like torpedoes in all the water ways of European politics, ought not to have been astonished that Italians, smarting under their country's wrongs, should try to avenge themselves on him for the expedition to Rome and the restoration of the papacy. To them Napoleon III. seemed to be a traitor, and the chief cause of their subjection to hateful and foreign masters. And Orsini's attempt was by no means the first. The French journals spoke gratefully of the fact that no Frenchmen were compromised in these attempts at assassination; the emperor himself, alarmed for his personal safety, and also sympathizing to some degree with the aspirations of Italy, began to think that he could secure himself from these secret and successive attacks only by satisfying the irritated feelings of Italy. The first result of it, however, was a period of terrorism at home, and of swaggering menace on the part of the army, unchecked by the Government, against England, that "lair of these monsters who are sheltered by its laws." England, disabused since the peace of its admiration for the imperial rule, replied by the volunteer movement, and the construction of defences on the coast. But the emperor's mind was not set on war with England. New Year's Day, 1859, disclosed to the diplomatic world his schemes against Austria, and showed that Italy would be the scene of warfare and change. The empress was known to be averse to a war which must be against the instincts of Catholicism. Prince Napoleon, who in January, 1859, married the princess Clotilde, daughter of Victor Emmanuel, king of Sardinia, was known to be in favor of an alliance with the Piedmontese for the liberation of Italy. The emperor, hoped to steer between the two; hoped to satisfy the Italians and to escape the alarms of conspiracy, and at the same time to satisfy the empress and the Catholic party by constructing an Italian federation of states under presidency of the pope. The current of affairs, the strength of the "doctrine of nationalities," the definite and heroic attitude of Italy herself, proved too strong for him. A federation in Italy, a federation in Switzerland, and a third in Germany, would have left France in the centre of the world, compact and powerful among weak and divided neighbors on every hand. This was the imperial policy; united Italy and united Germany destroyed the plan, and brought the empire with it to the ground.

The Italian War.

In July, 1858, Cavour and Napoleon had agreed on the terms of an alliance; Victor Emmanuel should be king of Italy, with possession of the north; Nice and Savoy, the cradle of his race, he agreed to surrender to France. With this understanding war began, after delusive talk respecting a congress, in April, 1859, Austria at the last moment forcing it on by ordering the cabinet of Turin to reduce its army and dismiss the volunteers. On the 3d of May the French Government also declared war, amidst the plaudits of Paris, and the enthusiasm of the army. The French at once entered Italy, by the Mont Cenis pass, and by sea, landing at Genoa. The emperor himself took the command in chief; King Victor Emmanuel placed himself under his orders. The affairs of Montebello and Palestro, in which the Piedmontese fought well, secured for France the safe passage of the Po. On June 4, the battle of Magenta, fought to open the passage of the Ticino, was won, after a very doubtful struggle, by the arrival of MacMahon, whom the emperor named marshal of France and duke of Magenta. The Austrians fell back, and the allies at once entered Milan. Baraguay-d'Hilliers pushed the Germans out of Marignano; and Garibaldi, with his chasseurs of the Alps, dislodging the Austrians from their positions round the Lago Maggiore, threatened their communications with Tyrol, their only sure line of retreat in case of ultimate disaster. Giulay, who commanded the Austrians, drew back within the Quadrilateral, as it was called, formed by the great fortresses of Peschiera, Mantua, Legnano, and Verona, a square within which, ever since 1815, the Austrians had been accumulating all their means of resistance. This Quadrilateral, well held, could effectually block the passage through North Italy; for Legnano stands on the Lago di Garda,

1859. which runs up into Switzerland, while Mantua is not far from the Po; an enemy venturing down southwards could never leave these great strongholds on his flank; their siege and reduction would give their holders time to recover from any disasters. To the attack of this strong position the allies now advanced; and on June 24 they met the Austrians to the west of the Mincio, and, therefore, just in advance of Peschiera and Mantua, in the broken ground which lies about the town of Solferino. The battle which then took place was fought with great gallantry by the allies, and some tenacity by the Austrians, who were on the defensive, and had the great advantage of the position, and of a thorough knowledge of the ground. French historians themselves allow that there was little strategy shown on either side: "At Solferino, as throughout the campaign, the command-in-chief was below its proper level." The defeat of the Austrians, without being crushing, was complete; they fell back to the neighborhood of Verona, the rally-point of the Quadrilateral, and the allies laid siege to Peschiera.

Battle of Solferino.

These successive victories, and the release of the Milanese from Austria domination, had an immediate effect on the rest of Italy. The duke of Tuscany had fled, and his territories were occupied by French troops under Prince Napoleon. The duke of Modena, after Magenta, also made his escape, and his duchy proclaimed Victor Emmanuel in his stead. The same took place in Parma. The "Legations," the northern portion of the States of the Church, threw off the papal government, and joyfully proclaimed their adhesion to the national cause. A French fleet in July appeared before Venice, and the queen of the Adriatic was burning to throw off the Austrian yoke. Still, every one thought that the war was scarcely begun, and, considering the strength of the Quadrilateral and the proverbial tenacity of the Austrians under defeat, it seemed not unlikely that changes in the fortune of war might yet favor the reactionary cause, when Europe was astonished to hear that the two emperors, in a conference at Villafranca, had agreed on the bases of a peace. There should be an Italian confederation under presidency of the pope; Lombardy (with exception of Peschiera and Mantua) should be surrendered to Napoleon, who should present it to the king of Sardinia; Venice should be allowed to enter the Italian confederacy, though it was still to be an Austrian possession; the dukes of Tuscany and Modena were to be replaced; reforms to be introduced into the papal states; not a word about the south of Italy. These terms agreed on, *viva voce*, between the emperors without a single witness on either side, were ratified in October, in the treaty of Zurich. The result, for the moment, satisfied no one. Austria was humiliated by it; Italy disappointed, in the very moment of hope and triumph; Germany and England deemed both the war and the peace a high-handed proceeding; and France herself, in spite of the successes of her army, wished that the high-sounding promise of her emperor, "Italy free, from the Alps to the Apennines," had been more nearly fulfilled. Finally, military critics noted that the generalship of the war left much to be desired, and that the organization of the army was very far from perfect. Further changes, results as much of the force of ideas as of diplomacy or of war, were sure to follow before long. Ominous utterances and influences of the Ultramontanes in France heralded coming difficulties even before the conclusion of the peace of Zurich. The pope, Pius IX., guided by the Jesuits, threw himself into the arms of the reactionary party; and Napoleon saw good reason to give up his chimerical scheme for an Italian federation under papal presidency. He declared his intention of founding a great kingdom of Northern Italy, and announced that Savoy and Nice were to be united to France by way of counterpoise. The forms of a plébiscite were duly gone through in those districts; and the transfer took place shortly afterwards.

The treaty of Zurich.

Even this change of attitude on the emperor's part, coupled as it was with the continuance of the French garrison at Rome, and the cession of Nice and Savoy, was offensive to Italian independence. Garibaldi, with his noble band of volunteers, amidst the warm sympathy of all liberal Europe, landed in Sicily, and soon defeated the half-hearted supporters of the wretched Neapolitan Government; Naples and Sicily were at once united to the Italian kingdom. Piedmontese troops entered the papal territories, and won the battle of Castelfidardo; general Lamoricière, who commanded the Papalini in the battle, was soon after taken, when Ancona, surrendered, and was sent back to France by the Italian Government. The victorious troops, leaving Rome and its French garrison on one side, joined the triumphant volunteer-army of Garibaldi. In February, 1861, Francis II. king of Naples, who was besieged in Gaeta, capitulated, and a new Italian parliament in the same month proclaimed Victor Emmanuel king of Italy. Rome alone was left out, the natural capital of the kingdom, defended from herself and from Italy by French bayonets. The political situation was indefensible.

Garibaldi in Sicily and Italy.

1861-1864.

During these years France had also been engaged in distant expeditions; a Chinese war, in alliance with England, occupied her from 1858 to 1860; the capture of Pekin brought this war to an end. In Cochin-China, also, France had Spain as an ally, and closed an obscure if successful war with a treaty of peace in 1862. The Syrian expedition of 1860, undertaken in harmony with the other Christian powers, speedily reduced the sultan to reason, and a French occupation, which lasted till June, 1861, did much to relieve the oppressed Christians of that part of the Turkish dominions. Lastly, the affairs of Mexico, in which the empress, guided by her clerical tastes, took an active part, led to the intervention of the emperor on behalf of the archduke Maximilian of Austria; at first England and Spain, which also had grievances against the revolutionary Government of Mexico, joined with France. England, however, had little real interest at stake; Spain wanted to place a prince of her own on the Mexican throne; when it came to the point, France was left to carry out her schemes as she could. The whole affair ended in a terrible disaster for the archduke in 1867, and discredit and loss to the imperial Government. It was seen by the elections of 1863 that, while the peasant-vote remained true to Napoleon III., the towns, following the leading of Paris, and in spite of all official efforts, sent up a strong minority to the opposition. It was clear that the educated and thinking part of France was already weary of the second empire.

Distant expeditions.

Now broke out the Danish war, which was the beginning of the consolidation of Germany. In 1852 the conference of London had settled the succession to the Danish crown on the duke of Glücksburg, who had married a Danish princess; when Frederick VII. died in 1863 and Christian IX. succeeded to the throne, the Germanic confederation, which had never agreed to the arrangement, protested against the union of Schleswig and Holstein to the Danish kingdom. Holstein had always been a German duchy, and vigorous colonization had made South Schleswig in large part German in population. The Danish Government allowed the federal forces, commanded by Baron Halkett, a Hanoverian general, to occupy Holstein provisionally, while it refused them possession of Schleswig; Prussia and Austria, acting in concert, early in 1864 invaded Schleswig, drove the Danes back, and stormed their lines at Düppel; after which they quietly occupied all the disputed territory. When England, with Russia and Sweden, pressed for a conference to settle the dispute by international arbitration, France held back, and refused to oppose Prussia and Austria. The emperor suggested, as a middle course, that a plébiscite, his favorite idea when nationalities were in question, should be taken in the two duchies. The conference admitted this for Holstein, and refused it for Schleswig, and on this point the negotiations were broken off. The allied Germans speedily brought the war to an end by their overwhelming strength, and in October, 1864, it was agreed, after some difficulties, that Austria should take charge of Holstein, and Prussia of Schleswig. The confederation gained nothing; and it was obvious that Austria, too, could gain nothing by the occupation of so distant a province. France, which had so much to lose, according to the "doctrine of nationalities," had placed on record her firm belief in that idea, and had helped Prussia to become the champion of it for Germany; the foolish Mexican war, and the state of feeling at home, had in fact hampered France so much as to render her almost powerless at this moment.

The Danish war.

The jealousy between north and south Germany, which has existed ever since the time of the Reformation, now passed into a new phase. Prussia stood forward again as the champion of

The growth of Prussian power.

1866-1867. German unity, which had failed in 1848, though it had never ceased to be the desire of the nation; and the convention of Gastein, by which Austria retained Holstein, provided a starting-point for a new war in 1866, the "Seven Weeks' War." A visit of Count Bismarck to Napoleon in 1865 had shown that great statesman that he had nothing to fear from France; the second empire seemed paralyzed; Italy hastened to treat at Berlin for the completion of her unity, for north Germany and she had the same aims and the same enemies. They both wanted their national life to be completed; both were struggling, in large part, against the Catholic Church; both had Austria as their chief foe. Thus secured, Bismarck went boldly to war; and in an incredibly short time had crushed the resistance of Hanover, while he destroyed the Austrian power at Sadowa. The treaty of Prague, under the mediation of Napoleon III., soon followed. Though the Italians had been defeated at Custozza in the end of June, Sadowa had stricken such a blow at the heart of Austria that she abandoned all thought of further resistance, delivered Venetia over to Napoleon, who restored it at once to Italy, and signed the peace of Prague in August, 1866. By this document the old German Confederation was dissolved; Prussia took full possession of Holstein, and also of Schleswig, under the promise that if the northern or Danish-speaking part of that duchy desired to return to Denmark, it might say so. Up to the present time, Prussia, true to her ancient tradition of never letting go, has quietly retained the whole of the duchy. A new confederacy of the north of Germany was established under the headship of the king of Prussia, and that kingdom also received considerable additions. It was agreed that the river Main, which runs across that narrowest part of Germany, that hilly and wooded country which has seen so many struggles for mastery, and which for centuries has been, roughly speaking, the dividing-line between Low and High Germany, should now once more separate the northern from the southern confederacy. This arrangement, however, came to naught; Baden at once placed itself under the command of Prussia, and Würtemberg and Bavaria before long did the same. Austria was left alone, and almost excluded from Germany, while Prussia became at once the strongest power in Europe. France, which had welcomed with enthusiasm the restoration of Venetia to Italy, looked with less glad eyes at this growth of German strength across the Rhine. Thiers, with clear foresight, in 1866 predicted the coming empire of Germany; M. Magne, addressing Napoleon, did not hesitate to say that "the national feelings would be profoundly wounded if the final result should be that France has only gained by her intervention the establishment on her two flanks of two neighbors of abnormally increased strength. Greatness is after all a relative affair; and a country which in itself is no weaker than it was may be diminished by the accumulation of new forces around it."

The treaty of Prague.

French troops withdraw from Rome.

In 1866, after a convention with Italy, the French troops withdrew from Rome, while Victor Emmanuel promised not to molest the pope. There came, however, to Rome a French legion, composed of volunteers, chiefly old Bourbon partisans, commanded by a French general and officers of the French army. The presence of these troops was naturally regarded by Italy as a violation of the convention; so that when Garibaldi with his volunteers, in 1867, attempted to raise patriotic feelings in the territory round Rome, and in concert with the citizens to gain entrance into the Eternal City, the Italian Government took no steps to prevent him. The emperor, however, with unlucky zeal, after much hesitation, despatched General de Failly with a strong force to succor the pope, and thus placed himself openly in antagonism with Italy. The French and papal troops defeated the Garibaldians at Mentana (3d November, 1867); and Italy regarded herself as thenceforward free from all obligation of gratitude towards imperial France. On the other hand, the clerical party loudly complained that the emperor had but half done his work, and grumbled because he had not used his victory to restore to the papacy its lost territory. Thus Napoleon III. lost the favor of both sides, and left on men's minds the impression that he was a weak and irresolute ruler. Nor did his efforts to purchase the luchy of Luxembourg from Holland add to his reputation (1866-1867). For the intervention of Prussia defeated all his plans; and although the fortifications of Luxembourg were demolished, and the Prussian garrison withdrawn, it was felt that the emperor's attempt to strengthen his north-eastern frontier had completely failed, and that the antagonism between France and Prussia must one day lead to troubles. The boldness of the opposition increased; each slight advantage yielded by the Government in these days gave it fresh strength; Thiers was listened to with great interest when he demonstrated in 1868 the hollowness of imperial finance, the terrible burden of debt, the growing dimensions of the army expenditure, which was not accompanied by any real increase in the fighting-strength of the nation. The elections of 1869 showed the quick growth of the opposition; far from the old unanimity, the imperial Government did not obtain quite three-fifths of the votes; and again the large towns returned republican candidates. In this assembly M. Gambetta[1] made his first public appearance among the "irreconcilables." In January, 1870, a quasi-liberal cabinet, headed by M. Ollivier, who had been won over by the emperor and empress in a private interview, endeavored to face the growing dissatisfaction; to reconcile the "irreconcilables," without endangering the imperial position. After many liberal professions, the emperor once more appealed to the country for a vote of confidence in himself, and in the hereditary character of his government. The reply of France seemed to be overwhelming and decisive,—7,358,786 Yes, against 1,571,939 No. This vote was taken on the 8th of May, 1870; within two months the Hohenzollern question had begun its ominous course.

Discontent in France.

1868-1870.

M. Gambetta appears.

The Hohenzollern question.

In 1868 the Spanish insurrection of September had dislodged Queen Isabella. She took refuge in France, with a crowd of partisans, and became at once the favored guest of the emperor and his Spanish spouse. In the provisional Government of Madrid General Prim in 1869 became president of the council of ministers, and began almost at once to search about Europe for an eligible king. In the course of his inquiries he happened on Prince Leopold of Hohenzollern-Sigmaringen, to whom he offered the crown of Spain without first announcing his intentions to the court of France. The intimacy existing between the empress and the ex-queen of Spain was no doubt a sufficient reason for this reticence. Prince Leopold at once informed the head of his house, the king of Prussia, of the fact, and the king authorized him to accept the offer. So stood affairs when the French cabinet thought it necessary to intervene. The two nations had regarded one another with distrust for years; in the beginning of the imperial rule the Prussians had stood aloof; the irritation which France felt at the Danish war passed into alarm after Sadowa. The failure of Benedetti's negotiation in 1870 with Bismarck as to Belgium added to the tension. The French Government was also uneasy at the evident signs of opposition at home, the decay of its popularity, the penalty of its corruption and extravagance; finally, there existed two courts, that of the empress and a more patriotic one, which dimly reflected the ancient antagonism between a Spanish party in high place and the true interests of the country. The emperor of the French, worn-out and more irresolute than ever, became the prey and victim of a faction. When Prince Leopold on learning the objections of France, withdrew his candidature, the French Government, instead of accepting the act in a conciliatory spirit, seemed to be inspired by the temper of the duke of Grammont's speech in the Assembly at the time. "We cannot allow the actual balance of power in Europe to be deranged, and the interest and honor of France to be imperilled. We firmly hope this may not happen; against it we count on both the prudence of Germany and the friendship of Spain. Were it to be otherwise, strong in your support and in that of the nation, we should know how to do our duty, without hesitation and without weakness;"—brave words and menacing, but words which required real strength behind them, the very thing which was lacking. The empress and her friends wanted war; and consequently the king of Prussia was pressed, as a further step, to give assurances that he never would support Prince Leopold in any future candidature for the Spanish throne. This was equivalent to saying that war was determined on; and the Prussian cabinet made no further effort for peace. Steps were taken in Paris for a fresh *coup d'état* against the liberals, if they proved too obstructive; the empress was eager to secure, by a successful war, the throne

[1] [Léon Gambetta (1832–82), of Genoese-Hebrew parentage, died from an accidental pistol wound in his hand. Attacked Napoleonism in defence of Delescluze in 1868, organized provisional government at Tours in 1870, forced President McMahon's resignation in 1879, was prime minister under Grévy in 1881.—AM. ED.]

1870. for her son, and to appear as the champion of Catholic and Ultramontane principles in Europe. While the liberal party in the chamber and the country, headed by Thiers, persistently opposed the war, the Bonapartists fiercely pushed matters on; they refused the good offices of the other states of Europe; in shameful ignorance of the truth, they declared that everything was ready—"five times ready," "ready to the last gaiter-button"—and were only eager to begin. The ruffians of Paris, intoxicated after their sort by the brilliancy of an imperial policy, mobbed Thiers, attacked his house, and filled the streets with yells of *à Berlin*.

War with Germany.

And thus war began, with the emperor as commander-in-chief and the empress as regent at Paris. France had no allies; her appeal to South Germany failed; Austria, however friendly, was paralyzed by Russia; for it was known that if Austria moved against Prussia, Russia would at once attack her; and the people of the lesser German states, whatever their Governments might think, were favorable to Prussia; for she seemed to them to be upholding a national cause. At Paris, the profoundest ignorance reigned. Nothing was known of the state of feeling in Germany, or of the real condition of the Prussian preparations for war. As little was known of the fitness of their own army for a great war; it was thought that it was strong and ready, whereas it was ill-organized, ill-supplied, and without proper reserves, while the incapacity of its leaders was appalling. No one knew anything of strategy; maps and plans were bad; even the employment of railways in war had never been properly studied; bravery there was in plenty, but leading and management were absolutely wanting. The French army was stretched across the frontier-line looking towards Germany from Strasburg to Metz; Metz became the French quarters-general, Mainz the German. By the 2d of August the hostile armies came into collision; the emperor's reconnaissance drove the Germans out of Sarrebruck on that day, and the prince imperial there underwent his "*Baptême de Feu*," a baptism into misfortune. This was the one and only success of the French arms across the German frontier; for on that same day General Douay was attacked and defeated at Wissembourg, and his position forced. Attacks followed sharply; on the 6th MacMahon was driven in at Wörth, and on the same day Frossard was defeated at the other end of the line. Before Paris had recovered from her delight at the trivial success of Sarrebruck, the ominous telegram, "Tout peut se retablir," awoke her to a true view of the state of things. It was soon seen that the emperor was unfit to command, and was a mere encumbrance; there was neither strategy in detail nor a definite plan of campaign; having let in the invasion, he resigned the post of commander-in-chief into the hands of Marshal Bazaine, and withdrew into Metz. The forward movement of the Germans soon alarmed both him and Paris, and then he decided (August 14) to retire to the camp at Chalons, where Marshal MacMahon was in command. The emperor's slow retreat, with a long train of useless followers, blocked the roads, and stopped the movement of troops and supplies. At this very time the Prussians and their allies were closing in on Metz; on the 14th at Borney, the 16th at Gravelotte, the 18th at Saint Privat, tremendous battles, in which the attacking Germans did not always get the best of it, hemmed the French in, and Bazaine withdrew with his large army into Metz. The French view of his conduct is that he meant to keep this army intact in order that afterwards, in conjunction with the Germans as his accomplices, he might secure, with a fresh military *coup d'état*, the imperial rule over France. Whatever he may have meant, the Germans had no intention of intrusting the fortunes of France to him. At this time General Trochu, an able soldier, whom the empress did not like, was appointed governor of Paris; the army of MacMahon was at Chalons intact, and a prudent ruler would have made these two strong forces act in concert. The empress, on the contrary, refused to hear of the emperor's return to Paris, and ordered MacMahon to march to the Belgian frontier, to take the Prussians on the flank, and to relieve Bazaine at Metz,—a plan excellent with a strong force able to march fast, fatal with an imperial army, disorganized, doubtful, and slow. The northward movement ended speedily in the great catastrophe of Sedan (1st September, 1870). On the 2d the emperor, with an army of more than 80,000 men, was the prisoner of war of the king of Prussia.

The ignorance in France.

The battle of Sedan.

1870-1872.

X. The Third Republic.

In spite of all precautions the news oozed out at Paris all too soon for the dismayed imperialists. On September 4, 1870, the third Republic was proclaimed, with a Government of national defence, of which the chief members were Thiers, Jules Favre, Jules Simon, and Gambetta; General Trochu was its military head. Gradually the Germans closed in on Paris; no serious resistance in the field being attempted, or indeed being possible, at a moment when one half of the available army of France lay in Metz and the other half was either destroyed or prisoners at Sedan. The first siege of Paris lasted from September 19, 1870, to January 30, 1871, during which period also the temporal power of the papacy came to an end (September, 1870), for it fell with the imperial cause, which alone had held it up; and in December, 1870, at Versailles, the king of Prussia was proclaimed head of a new empire of Germany. With a German emperor, and Victor Emmanuel at Rome, and France in extremities, it was clear that great changes had come, and must lead eventually to broad rearrangements of the political world. While Paris held out bravely enough, if not very wisely, Gambetta at Tours used incredible efforts to raise fresh armies for France; the old hero of Italy, Garibaldi, also appeared, now that imperialism was gone, and placed his sword at the disposal of the struggling republic. Before the end of October the capitulation of Metz had released a whole German army, which protected the operations of the besieging hosts; at last, on January 28th, 1871, an armistice was announced, which brought the despairing resistance of Paris to an end. The war elsewhere died out almost at once; the Germans occupied all the forts round Paris.

The third Republic.

The first siege of Paris.

On 8th February elections took place for a National Assembly to be held at Bordeaux, to deliberate on the question of peace or war, or rather, to arrange the terms of peace,—for the country returned the Assembly with that intention. It was a body nominally republican, with strong monarchical leanings, as yet unexpressed; hardly half a dozen Bonapartists were returned to it. Garibaldi was among the deputies elected, though he declined the honor of acting as a Frenchman. The new republican Government of France now had M. Grévy as president, and Thiers as chief of the executive power; and it was decided that the Assembly should sit at Versailles. The fierce outbreak of the hot republicans of Paris interfered sorely with their peaceful labors. On 18th March the commune of Paris declared itself in opposition to the Versailles republic; the old grudges of artisan Paris once more asserted their unpleasant existence; and Marshal MacMahon was instructed by the Versailles Assembly to reduce the insurgent capital. Then followed the second siege of Paris, from April 2 to May 21, with its accompanying horrors, and the gloomy spectacle of street-fighting and the burning and ruin of the public buildings of the town.

The Assembly of Bordeaux.

The second siege of Paris.

Meanwhile M. Thiers, with infinite toil, and with journeys from court to court of Europe, had at last, by his unwearying activity, succeeded in getting terms of peace agreed to. The treaty of Frankfort was signed on the 10th of May, 1871; by it Alsace and a large part of Lorraine were ceded back to Germany, while Belfort was restored to France; a huge money indemnity was to be paid to Germany for the costs of the war.

The treaty of Frankfort.

The reactionary measures of the Versailles Assembly soon began,—timidly at first, to push forward with boldness, if the first steps succeeded. Thus, it suppressed the national guard, in spite of the moderate opposition of M. Thiers; it allowed Orleanist princes and members of the Bonapartist family to enter the Assembly; it strengthened its position at Versailles, though it had not the courage to move the Government offices thither. Early in 1872 the opposition of the Assembly to his financial proposals led to a first resignation of M. Thiers; only on its earnest and almost unanimous petition did he consent to hold office any longer. Meanwhile, the attempts at a fusion between the legitimists and Orleanists failed completely; the efforts of the Bonapartists, led by M.

The reactionary Versailles Assembly.

The parties in it.

1872-1877. Roulier, were redoubled; a great organized propaganda was set afoot; newspapers, pamphlets, photographs, bribes for the army and for Government officials, intrigues of every kind, were in motion, in order to create a public opinion on behalf of the emperor and the young prince imperial, as he was still persistently called. The three parties agreed in one thing, at least,—that they would before long put an end to the republic. At the end of 1872 a commission of thirty was appointed to regulate the arrangement of public powers and duties, and to settle the vexed question of ministerial responsibility. It was composed of a majority of the Right, the members of the different anti-republican parties in the Assembly. From it sprang the attempts of the Assembly to postpone the day of its dissolution, and to frame the government of France in such a way as to secure the defeat of the republic. The weakness of the majority lay in the fact that their union was only negative; and that if they did agree, it was only till they could rid themselves of the republic.

Death of Napoleon III.

The death of Napoleon III. at Chiselhurst in January, 1873, created little or no feeling in France, and showed that imperialism had small hold on the popular mind. The Assembly now decided that it would remove the president from the chamber, because of the great influence which Thiers could always exert on a debate; and, secondly, that it would push back its own dissolution as far as possible. These proposals Thiers accepted, rather than run the risk of a collision, When, however, it was announced that, thanks chiefly to the president's exertion, the evacuation of France by the Prussian troops would take place two years sooner than had been originally stipulated, and that the last foreign soldier would march off in September, 1873, the parties of the majority became seriously alarmed; for the life of the Assembly had been, by their own admission, connected with the period of continuance of German troops in France. Early in April, 1873, on the resignation of M. Grévy, president of the chamber, they carried their candidate M. Buffet, against the Thiers Government; in May they came to close quarters, and brandishing their favorite weapon, the "red spectre," these three reactionary parties defeated Thiers by a majority of 16 (360 against 344). Then the old minister resigned, and the parties, which had arranged their plans beforehand, at once elected as president Marshal MacMahon, the "honnête homme et soldat," as he styled himself. With him they associated a cabinet of which the head was M. de Broglie. Immediately the functionaries were changed throughout France, and everywhere old imperialists were put in. At the beginning of 1875 it was agreed that the presidency should be for seven years, and a new constitution, with the republican element as much as possible effaced, was set up in February, 1875. Before this M. de Broglie had fallen under the ill-will of the monarchical parties, and had been compelled by an adverse vote of the chamber to send in his resignation. He was succeeded by General de Cissey, with what was called, by an inopportune invention, "a business cabinet." The new constitution provided a president with a cabinet, a body which, by being thus styled "a business cabinet," seemed to make the president's personality all the stronger; then there was a senate of 300 members, of whom 75 were life-holders, and the rest elected for nine years, renewable by triennial elections of a third at a time; and, lastly, a chamber of deputies, to be elected by the country in the usual way.

Fall of M. Thiers.

A reactionary constitution.

The dissolution of the Assembly.

The time came at last when the chamber, which had been elected to decide on peace or war, and had taken to itself the functions of a constituent assembly, and had framed a new constitution, and had defied the public opinion of France expressed at almost every bye-election, must bring its half-usurped functions to an end. The successive triumphs of the republicans in bye-elections had strengthened them so much that they could now hold their own in the chamber. The president, aware that his strength was going, got rid of the cabinet of Dufaure and Jules Simon, and, trusting to official pressure at a new election, hoping also to work on the old fears respecting the extremer party, the "irreconcilables," took advantage of an adverse vote, and after having in May, 1877, adjourned the chamber for a month, eventually dissolved it on June 25, 1877. The republican party showed extraordinary prudence and moderation under excessive provocation; the influence of the great jurists, Dufaure and Grévy, made itself felt, neutralizing all the plots of the reaction, and quietly prolonging the crisis, until the country could speak; the "Opportunists," as the followers of Thiers and Gambetta were now styled, united with the "irreconcilables" in opposition to the "party of order," as the intriguers of the three reactionary groups, legitimists, Orleanists, imperialists, loved to call themselves. In spite of shameless interferences with the election, in spite of the unseemly appeal of the president himself, in spite of threats and all the ancient weapons of reaction, the country was so decidedly republican that even the death of Thiers (3d September, 1877) could not for a moment check the fortunes of his party. His death perhaps even strengthened it, for he became the saint instead of being the leader of it. His chequered political career, so long past, was quite forgotten; his memory was revered as that of the statesman who in his old age saved Belfort to France, brought peace, secured the payment of the war indemnity, and relieved the country from the German occupation. All France felt that under his guidance tranquillity had returned, and the timid middle classes had learned to couple prosperity with the republic. And so the elections of 1877 returned a decisive majority for the republicans, now headed by MM. Grévy and Gambetta; the "irreconcilables" were not strong in the new chamber; the reactionary parties lost ground; and M. Grévy was at once re-elected president of the chamber. Consequently, the marshal president, after France had been deeply agitated by rumors of a new *coup d'état*, and by ominous movements of troops, at last gave way, and, honestly if reluctantly, accepted the verdict of the country. The reactionary "Ministry of May 16" fell, and, after a new attempt at a "business ministry," a republican cabinet was formed at last (14th December, 1877), under the presidency of M. Dufaure. By degrees, as the shameless behavior of officials at election after election came to light, the bureaucracy of France began to resume a republican color, by removals of reactionary prefects, by opportune changes of political views, and acquiescence in the loudly pronounced opinion of the nation. The army, which was far from satisfied with the late Government, showed signs of content under the new. In the senate only did the three reactionary parties still possess any power; and even there their majority was so small that they could not venture on serious resistance. The Orleanist section, which, though very weak in numbers, still held the balance, and could give the majority to either side, was timid and moderate, and averse to heroic measures Their refusal to prolong the crisis by consenting to a second dissolution of the chamber of deputies gave time for the moderate republic to consolidate its powers. The elections of 5th January, 1879, in which, according to the present constitution of France, one-third of the senate has undergone re-election, have happily brought that body into harmony with the chamber of deputies and the country. Fresh rumors of trouble had been industriously circulated; the temper of France is, however, so thoroughly tranquil, and so decided in favor of a constitutional republic, that the hopes of the reactionary parties have all been frustrated.

1877-1879

Death of Thiers.

The Assembly of 1877.

It is always absurd to indulge in historical prophecy; and forecasts as to the future of France, thanks to the quick movement of opinion, the general ignorance of the country people, the vehemence in the towns, the long succession of changes in government and constitution, must be specially precarious. Still, it is clear that, for a time at least, the reaction, however strong elsewhere, has been defeated in France; above all it is clear that imperialism has received a heavy if not a fatal blow. This is no little matter. We live in days in which the growth of a modern imperialism, based on huge armaments and destructive of small states, had become a standing menace to the well-being of the world; it is a ground for hope and thankfulness that France, the central state of Europe, has definitely and calmly abandoned her imperialist traditions, and set herself to live the temperate life of a constitutional republic.

Conclusion.

Each race has its own special function in the general polity of nations; France seems called to lead in the propagation of wholesome political ideas. Even in her most violent moods, her principles have been right, her theories humane and noble. It is true that she is deficient in many

practical gifts; religion with her has ever held a very secondary place; her ideas on economical questions are narrow, and in many points her sympathies are not enlisted on behalf of what seems to us to be best. Still, her present position is an incalculable gain to Europe, and a promise of good for the future. With France as a prudent republic, the resistance of the peoples of Europe to arbitrary power and crushing armies will gradually be strengthened; and constitutional life, already developing itself throughout the Latin races, will find its best guarantee of stability. The movements of Europe have often taken their rise from France; the union of a strong government with a vigorous national life may also come to date from her; if England has striven to impress the practical rendering of her constitutional principles and her tongue on half the world, France can also boast that she has provided her part by enunciating, with the most admirable clearness of speech and thought, those general ideas as to the relations between man and man which lie at the basis of any wholesome system of government. (Continued in Supplements.) (G. W. K.)

PART III.—FRENCH LANGUAGE.

I. *Geography.*—French is the general name of the north-north-western group of Romanic dialects, the modern Latin of northern Gaul (carried by emigration to some places—as Lower Canada—out of France). In a restricted sense it is that variety of the Parisian dialect which is spoken by the educated, and is the general literary language of France. The region in which the native language is termed French consists of the northern half of France (including Lorraine) and parts of Belgium and Switzerland; its boundaries on the west are the Atlantic Ocean and the Celtic dialects of Brittany; on the north-west and north, the English Channel; on the north-east and east the Teutonic dialects of Belgium, Germany, and Switzerland. In the south-east and south the boundary is to a great extent conventional and ill-defined, there being originally no linguistic break between the southern French dialects and the northern Provençal dialects of southern France, north-western Italy, and south-western Switzerland. It is formed partly by spaces of intermediate dialects (some of whose features are French, others Provençal), partly by spaces of mixed dialects resulting from the invasion of the space by more northern and more southern settlers, partly by lines where the intermediate dialects have been suppressed by more northern (French) and more southern (Provençal) dialects without these having mixed. Starting in the west at the mouth of the Gironde, the boundary runs nearly north soon after passing Bordeaux; a little north of Angoulême it turns to the east, and runs in this direction into Switzerland to the north of Geneva.

II. *External History.*—(*a*) *Political.*—By the Roman conquests the language of Rome was spread over the greater part of southern and western Europe, and gradually supplanted the native tongues. The language introduced was at first nearly uniform over the whole empire, Latin provincialisms and many more or less general features of the older vulgar language being suppressed by the preponderating influence of the educated speech of the capital. As legions became stationary, as colonies were formed, and as the natives adopted the language of their conquerors, this language split up into local dialects, the distinguishing features of which are due, as far as can be ascertained (except, to some extent, as to the vocabulary), not to speakers of different nationalities misspeaking Latin, each with the peculiarities of his native language, but to the fact that linguistic changes, which are ever occurring, are not perfectly uniform over a large area, however homogeneous the speakers. As Gaul was not conquered by Cæsar till the middle of the first century before our era, its Latin cannot have begun to differ from that of Rome till after that date; but the artificial retention of classical Latin as the literary and official language after the popular spoken language had diverged from it, often renders the chronology of the earlier periods of the Romanic languages obscure. It is, however, certain that the popular Latin of Gaul had become differentiated from that of central Italy before the Teutonic conquest of Gaul, which was not completed till the latter half of the 5th century; the invaders gradually adopted the language of their more civilized subjects, which remained unaffected, except in its vocabulary. Probably by this time it had diverged so widely from the artificially preserved literary language that it could no longer be regarded merely as mispronounced Latin; the Latin documents of the next following centuries contain many clearly popular words and forms, and the literary and popular languages are distinguished as *latina* and *romana*. The term *gallica*, at first denoting the native Celtic language of Gaul, is found applied to its supplanter before the end of the 9th century, and survives in the Breton *gallek*, the regular term for "French." After the Franks in Gaul had abandoned their native Teutonic language, the term *francisca*, by which this was denoted, came to be applied to the Romanic one they adopted, and, under the form *française*, remains its native name to this day; but this name was confined to the Romanic of northern Gaul, which makes it probable that this, at the time of the adoption of the name *francisca*, had become distinct from the Romanic of southern Gaul. *Francisca* is the Teutonic adjective *frankisk*, which occurs in Old English in the form *frencisc;* this word, with its umlauted *e* from *a* with following *i*, survives under the form *French*, which, though purely Teutonic in origin and form, has long been exclusively applied to the Romanic language and inhabitants of Gaul. The German name *franzose*, with its accent on, and *o* in, the second syllable, comes from *françois*, a native French form older than *français*, but later than the Early Old French *franceis*. The Scandinavian settlers on the north-west coast of France early in the 10th century quickly lost their native speech, which left no trace except in some contributions to the vocabulary of the language they adopted. The main feature since is the growth of the political supremacy of Paris, carrying with it that of its dialect; in 1539 Francis I. ordered that all public documents should be in French (of Paris), which then became the official language of the whole kingdom, though it is still foreign to nearly half its population.

The conquest of England in 1066 by William, duke of Normandy, introduced into England, as the language of the rulers and (for a time) most of the writers, the dialects spoken in Normandy. Confined in their native country to definite areas, these dialects, following their speakers, became mixed in England, so that their forms were used to some extent indifferently; and the constant communication with Normandy maintained during several reigns introduced also later forms of Continental Norman. As the conquerors learned the language of the conquered, and as the more cultured of the latter learned that of the former, the Norman of England (including that of the English-speaking Lowlands of Scotland) became anglicized; instead of following the changes of the Norman of France, it followed those of English. The accession in 1154 of Henry II. of Anjou disturbed the Norman character of Anglo-French, and the loss of Normandy under John in 1204 gave full play to the literary importance of the French of Paris, many of whose forms afterwards penetrated to England. At the same time English, with a large French addition to its vocabulary, was steadily recovering its supremacy, and is officially employed (for the first time since the Conquest) in the Proclamation of Henry III., 1258. The semi-artificial result of this mixture of French of different dialects and of different periods, more or less anglicized according to the date or education of the speaker or writer, is generally termed "the Anglo-Norman dialect;" very misleadingly for a great part of its existence, because, while the French of Normandy was not a single dialect, the later French of England came from other French provinces besides Normandy, and being to a considerable extent in artificial conditions, was checked in the natural development implied by the term "dialect." The disuse of Anglo-French as a natural language is evidenced by English being substituted for it in legal proceedings in 1362, and in schools in 1387; but law reports were written in it up to 1600, and converted into modern literary French, it remains in official use for giving the royal assent to bills of parliament.

(*b*) *Literary.*—Doubtless because the popular Latin of northern Gaul changed more rapidly than that of any other part of the empire, French was, of all the Romanic dialects, the first to be recognized as a distinct language, and the first to be used in literature; and though the oldest specimen now extant is probably not the first, it is considerably earlier than any existing documents of the allied languages. In 813 the council of Tours ordered certain homilies to be translated into Rustic Roman or into German; and in 842 Louis the German, Charles the Bald, and their armies confirmed their engagements by taking oaths in both languages at Strasburg. These have been preserved to us by the his-

torian Nithard (who died in 853); and though, in consequence of the only existing manuscript (at Rome) being more than a century later than the time of the author, certain alterations have occurred in the text of the French oaths, they present more archaic forms (probably of North-Eastern French) than any other document. The next memorials are a short poem, probably North-Eastern, on St. Eulalia, preserved in a manuscript of the 10th century at Valenciennes, and some autograph fragments (also at Valenciennes) of a homily on the prophet Jonah, in mixed Latin and Eastern French, of the same period. To the same century belong a poem on Christ's Passion, apparently in a mixed (not intermediate) language of French and Provençal, and one, probably in South-Eastern French, on St. Leger; both are preserved, in different handwritings, in a MS. at Clermont-Ferrand, whose scribes have introduced many Provençal forms. After the middle of the 11th century literary remains are comparatively numerous; the chief early representatives of the main dialects are the following, some of them preserved in several MSS., the earliest of which, however (the only ones here mentioned), are in several cases a generation or two later than the works themselves. In Western French are a verse life of St. Alexius (Alexis), probably Norman, in an Anglo-Norman MS. at Hildesheim; the epic poem of Roland, possibly also Norman, in an A.-N. MS. at Oxford; a Norman verbal translation of the Psalms, in an A.-N. MS. also at Oxford; another later one in an A.-N. MS. at Cambridge; a Norman translation of the Four Books of Kings, in a native MS. at Paris. The earliest work in the Parisian dialect is probably the Travels of Charlemagne, preserved in a late Anglo-Norman MS. with much-altered forms. In Eastern French, of rather later date, there are translations of the Dialogues of Pope Gregory, in a MS. at Paris, containing also fragments of Gregory's Moralities, and (still later) of some Sermons of St. Bernard, in a MS. also at Paris. From the end of the 12th century literary and official documents, often including local charters, abound in almost every dialect, until the growing influence of Paris caused its language to supersede in writing the other local ones. This influence, occasionally apparent in the 12th century, was overpowering in the 15th, when authors, though often displaying provincialisms, almost all wrote in the dialect of the capital; the last dialect to lose its literary independence was the North-Eastern, which, being the Romanic language of Flanders, had a political life of its own, and (modified by Parisian) was used in literature after 1400.

III. *Internal History.*—So little has been done until recently, and so much remains to be done, in the scientific investigation of the sounds, inflexions, and syntax of the older stages and dialects of French, that what follows cannot claim to be more than a fragmentary sketch, mainly of the dialects—that which is now literary modern French, and those which were imported into England by the Normans—in which English readers will probably take most interest, and especially of the features which explain the forms of English words of French origin. Dates and places are only approximations, and many statements are liable to be modified by further researches; want of space obliges many exceptions and limitations to the general laws, and many points of hardly inferior importance to those here noticed, to be passed over in silence. The primitive Latin forms given are often not classical Latin words, but derivatives from these; and reference is generally made to the Middle English (Chaucerian) pronunciation of English words, not the modern.

(*a*) *Vocabulary.*—The fundamental part of the vocabulary of French is the Latin imported into Gaul, the French words being simply the Latin words themselves, with the natural changes undergone by all living speech, or derivatives formed at various dates. Comparatively few words were introduced from the Celtic language of the native inhabitants (*bec lieue* from the Celtic words given by Latin writers as *beccus, leuca*), but the number adopted from the language of the Teutonic conquerors of Gaul is large (*guerre* = *werra; laid* = *laidh; choisir* = *kausjan*). The words were imported at different periods of the Teutonic supremacy, and consequently show chronological differences in their sounds (*haïr* = *hatan; français* = *frañkisk; écrevisse* = *krebiz; échine* = *skina*). Small separate importations of Teutonic words resulted from the Scandinavian settlement in France, and the commercial intercourse with the Low German nations on the North Sea (*friper* = Norse *hripa; chaloupe* = Dutch *sloop; est* = Old English *ēast*). In the mean time, as Latin (with considerable alterations in pronunciation, vocabulary, etc.) continued in literary, official, and ecclesiastical use, the popular language borrowed from time to time various more or less altered classical Latin words; and when the popular language came to be used in literature, especially in that of the church, these importations largely increased (*virginitet* Eulalia = *virginitātem; imagena* Alexis = *imāginem*—the popular forms would probably have been *vernedet, emain*). At the Renaissance they became very abundant, and have continued since, stifling to some extent the developmental power of the language. Imported words, whether Teutonic, classical Latin, or other, often receive some modification at their importation, and always take part in all subsequent natural phonetic changes in the language (Early old French *adversarie*, modern French *adversaire*). Those French words which appear to contradict the phonetic laws were mostly introduced into the language after the taking place (in words already existing in the language) of the changes formulated by the laws in question; compare the late imported *laïque* with the inherited *lai*, both from Latin *laicum*. In this and many other cases the language possesses two forms of the same Latin words, one descended from it, the other borrowed (*meuble* and *mobile* from *mōbilem*). Some Oriental and other foreign words were brought in by the crusaders (*amiral* from *amīr*); in the 16th century, wars, royal marriages, and literature caused a large number of Italian words (*soldat* = *soldato; brave* = *bravo; caresser* = *carezzare*) to be introduced, and many Spanish ones (*alcôve* = *alcoba; hâbler* = *hablar*). A few words have been furnished by Provençal (*abeille, cadenas*), and several have been adopted from other dialects into the French of Paris (*esquiver* Norman or Picard for the Paris French *eschiver*). German has contributed a few (*blocus* = *blochūs; choucroute* = *sūrkrūt*); and recently a considerable number have been imported from England (*drain, comfortable, flirter*). In Old French, new words are freely formed by derivation, and to a less extent by composition; in Modern French, borrowing from Latin or other foreign languages is the more usual course. Of the French words now obsolete some have disappeared because the things they express are obsolete; others have been replaced by words of native formation, and many have been superseded by foreign words generally of literary origin; of those which survive, many have undergone considerable alterations in meaning. A large number of Old French words and meanings, now extinct in the language of Paris, were introduced into English after the Norman Conquest; and though some have perished, many have survived—*strife* from Old French *estrif* (Teutonic *strīt*); *quaint* from *cointe* (*cognitum*); *remember* from *remembrer* (*rememorāre*); *chaplet* (garland) from *chapelet* (Modern French "chaplet of beads"); *appointment* (rendezvous) from *appointement* (now "salary"). Many also survive in other French dialects.

(*b*) *Dialects.*—The history of the French language from the period of its earliest extant literary memorials is that of the dialects composing it. But as the popular notion of a dialect as the speech of a definite era, possessing certain peculiarities confined to and extending throughout that era, is far from correct, it will be advisable to drop the misleading divisions into "Norman dialect," "Picard dialect," and the like, and take instead each important feature in the chronological order (as far as can be ascertained) of its development, pointing out roughly the area in which it exists, and its present state. The local terms used are intentionally vague, and it does not, for instance, at all follow that because "Eastern" and "Western" are used to denote the localities of more than one dialectal feature, the boundary line between the two divisions is the same in each case. It is, indeed, because dialectal differences as they arise do not follow the same boundary lines (much less the political divisions of provinces), but cross one another to any extent, that to speak of the dialect of a large area as an individual whole, unless that area is cut off by physical or alien linguistic boundaries, creates only confusion. Thus the Central French of Paris the ancestor of classical Modern French, belongs to the South in having *ts*, not *tsh*, for Latin *k* (*c*) before *i* and *e; tsh*, not *k*, for *k* (*c*) before *a;* and *gu*, not *w*, for Teutonic *w;* while it belongs to the East in having *oi* for earlier *ei;* and to the West in having *é*, not *ei*, for Latin *a;* and *i*, not *ei*, from Latin *ĕ* + *i*. It may be well to note that Southern *French* does not correspond to southern *France*, whose native language is Provençal. "Modern French" means ordinary educated Parisian French.

(c) *Phonology.*—The history of the sounds of a language is, to a considerable extent, that of its inflexions, which, no less than the body of a word, are composed of sounds. This fact, and the fact that unconscious changes are much more reducible to law than conscious ones, render the phonology of a language by far the surest and widest foundation for its dialectology, the importance of the sound-changes in this respect depending, not on their prominence, but on the earliness of their date. For several centuries after the divergence between spoken and written Latin, the history of these changes has to be determined mainly by reasoning, aided by a little direct evidence in the misspellings of inscriptions, the semi-popular forms in glossaries, and the warnings of Latin grammarians against vulgarities. With the rise of Romanic literature the materials for tracing the changes become abundant, though as they do not give us the sounds themselves, but only their written representations, much difficulty, and some uncertainty, often attach to deciphering the evidence. Fortunately, early Romanic orthography, that of Old French included (for which see next section), was phonetic, as Italian orthography still is; the alphabet was imperfect, as many new sounds had to be represented which were not provided for in the Roman alphabet from which it arose, but writers aimed at representing the sounds they uttered, not at using a fixed combination of letters for each word, however they pronounced it,

The characteristics of French as distinguished from the allied languages and from Latin, and the relations of its sounds, inflexions, and syntax to those of the last-named language, belong to the general subject of the Romanic languages. It will be well, however, to mention here some of the features in which it agrees with the closely related Provençal, and some in which it differs. As to the latter, it has already been pointed out that the two languages glide insensibly into one another, there being a belt of dialects which possess some of the features of each. French and Provençal of the 10th century—the earliest date at which documents exist in both—agree to a great extent in the treatment of Latin final consonants and the vowels preceding them, a matter of great importance for inflexions (numerous French examples occur in this section.) (1) They reject all vowels, except *a*, of Latin final (unaccented) syllables, unless preceded by certain consonant combinations or followed by *nt* (here, as elsewhere, certain exceptions cannot be noticed); (2) they do not reject *a* similarly situated; (3) they reject final (unaccented) *m*; (4) they retain final *s*. French and Northern Provençal also agree in changing Latin *ū* from a labio-guttural to a labio-palatal vowel; the modern sound (German *ü*) of the accented vowel of French *lune*, Provençal *luna*, contrasting with that in Italian and Spanish *luna*, appears to have existed before the earliest extant documents. The final vowel laws generally apply to the unaccented vowel preceding the accented syllable, if it is preceded by another syllable, and followed by a single consonant—*matin* (*mātūtīnum*), *dortoir* (*dormītōrium*), with vowel dropped; *canevas* (*cannabāceum*), *armedure* later *armëure*, now *armure* (*armātūram*), with *e* = ə, as explained below.

On the other hand, French differs from Provençal:—(1) in uniformly preserving (in Early Old French) Latin final *t*, which is generally rejected in Provençal—French *aimet* (Latin *amat*), Provençal *ama; aiment* (*amant*), *aman;* (2) in always rejecting, absorbing, or consonantizing the vowel of the last syllable but one, if unaccented; in such words as *angele* (often spelt *angle*), the *e* after the *g* only serves to show its soft sound—French *veintre* (*vaincre*, Latin *vĭncere*), Provençal *vencer*, with accent on first syllable; French *esclandre* (*scandalum*), Provençal *escandol;* French *olie* (dissyllabic, *i* = *y* consonant, now *huile*), Provençal *oli* (*oleum*); (3) in changing accented *a* not in position into *ai* before nasals and gutturals and not after a palatal, and elsewhere into *é* (West French) or *ei* (East French), which develops an *i* before it when preceded by a palatal—French *main* (Latin *manum*), Provençal *man; aigre* (*ācrem*), *agre; ele* (*ālam*), East French *eile, ala; meitié* (*medietātem*), East French *moitieit, meitat;* (4) in changing *a* in unaccented final syllables into the vowel ə, intermediate to *a* and *e;* this vowel is written *a* in one or two of the older documents, elsewhere *e*—French *aime* (Latin *amā*), Provençal *ama; aimes* (*amās*), *amas; aimet* (*amat*), *ama;* (5) in changing original *au* into *ȯ*—French *or* (*aurum*), Provençal *aur; rober* (Teutonic *raubōn*), *raubar;* (6) in changing general Romanic *é*, from accented *ē* and *ĭ* not in position, into *ei*—French *veine* (*vēnam*). Provençal *vena; peil* (*pilum*), *pel.*

As some of the dialectal differences were in existence at the date of the earliest extant documents, and as the existing materials, till the latter half of the 11th century, are scanty and of uncertain locality, the chronological order (here adopted) of the earlier sound-changes is only tentative.

(1.) Northern French has *tsh* (written *c* or *ch*) for Latin *k* (*c*) and *t* before palatal vowels, where Central and Southern French have *ts* (written *c* or *z*)—North Norman and Picard *chire* (*cēram*), *brach* (*brāchium*), *plache* (*plateam*); Parisian, South Norman, etc., *cire, braz, place.* Before the close of the Early Old French period (12th century) *ts* loses its initial consonant, and the same happened to *tsh* a century or two later; with this change the old distinction is maintained—Modern Guernsey and Picard *chire*, Modern Picard *plache* (in ordinary Modern French spelling); usual French *cire, place.* English, having borrowed from North and South Norman (and later Parisian), has instances of both *tsh* and *s*, the former in comparatively small number—*chisel* (Modern French *ciseau* = (?) *caesellum*), *escutcheon* (*écusson, scūtiōnem*); *city* (*cité, cīvitātem*), *place.* (2.) Initial Teutonic *w* is retained in the north-east and along the north coast; elsewhere, as in the other Romance languages, *g* was prefixed—Picard, etc., *warde* (Teutonic *warda*), *werre* (*werra*); Parisian, etc., *guarde, guerre.* In the 12th century the *u* or *w* of *gu* dropped, giving the Modern French *garde, guerre* (with *gu* = *g*); *w* remains in Picard and Walloon, but in North Normandy it becomes *v*—Modern Guernsey *vâson*, Walloon *wazon*, Modern French *gazon* (Teutonic *waso*n). English has both forms, sometimes in words originally the same—*wage* and *gage* (Modern French *gage*, Teutonic *wadi*); *warden* and *guardian* (*gardien, warding*). (3.) Latin *b* after accented *a* in the imperfect of the first conjugation, which becomes *v* in Eastern French, in Western French further changes to *w*, and forms the diphthong *ȯu* with the preceding vowel—Norman *amowe* (*amābam*), *portout* (*portābat*); Burgundian *ameve, portevet. Eve* is still retained in some places, but generally the imperfect of the first conjugation is assimilated to that of the others—*amoit*, like *avoit* (*habēbat*). (4.) The palatalization of every then existing *k* and *g* (hard) when followed by *a, i*, or *e*, after having caused the development of *i* before the *e* (East French *ei*) derived from *a* not in position, is abandoned in the north, the consonants returning to ordinary *k* or *g*, while in the centre and south they are assibilated to *tsh* or *dzh*—North Norman and Picard *cachier* (*captiāre*), *kier* (*cārum*), *cose* (*causam*), *eskiver* (Teutonic *skiuhan*), *wiket* (Teutonic *wik* + *ittum*), *gal* (*gallum*), *gardin* (from Teutonic *gard*); South Norman and Parisian *chacier, chier, chose, eschiver, guichet, jal, jardin.* Probably in the 14th century the initial consonant of *tsh, dzh* disappeared, giving the modern French *chasser, jardin* with *ch* = *sh* and *j* = *zh;* but *tsh* is retained in Walloon, and *dzh* in Lorraine. The Northern forms survive—Modern Guernsey *cachier, gardȧn;* Picard *cacher, gardin.* English possesses numerous examples of both forms, sometimes in related words—*catch* and *chase; wicket, eschew; garden, jaundice* (*jaunisse*, from *galbanum*). (5.) For Latin accented *a* not in position Western French usually has *é*, Eastern French *ei*, both of which take an *i* before them when a palatal precedes—Norman and Parisian *per* (*parem*), *oiez* (*audiātis*); Lorraine *pier, oieis.* In the 17th and 18th centuries close *é* changed to open *è*, except when final or before a silent consonant—*amer* (*amārum*) now having *è*, *aimer* (*amāre*) retaining *é*. English shows the Western close *é*—*peer* (Modern French *pair*, Old French *per*), *chief* (*chef, caput*); Middle High German the Eastern *ei*—*lameir* (Modern French *l'amer, l'aimer, la mer* = Latin *mare*). (6.) Latin accented *e* not in position, when it came to be followed in Old French by *i*, unites with this to form *i* in the Western dialects, while the Eastern have the diphthong *oi*—Picard, Norman, and Parisian *pire* (*pejor*), *piz* (*pectus*); Burgundian *peire, peiz.* The distinction is still preserved—Modern French *pire, pis;* Modern Burgundian *peire, pei.* English words show always *i*—*price* (*prix, pretium*), *spite* (*dépit, dēspectum*). (7.) The nasalization of vowels followed by a nasal consonant did not take place simultaneously with all the vowels. *A* and *e* before *n̈* (guttural *n*, as in *sing*), *ñ* (palatal *n*), *n*, and *m* were nasal in the 11th century, such words as *tant* (*tantum*) and *gent* (*gentem*) forming in the Alexis assonances to themselves, distinct from the assonances with *a* and *e* before non-nasal consonants. In the Roland *umbre* (*ombre, umbram*) and *culchet* (*couche, collocat*), *fier* (*ferum*) and *chiens* (*canēs*), *dit* (*dictum*) and *vint* (*vēnit*), *ceinte* (*cĭnctam*) and *veie* (*voie, viam*), *brun* (Teutonic *brūn*) and *fut* (*fuit*) assonate freely, though *o* (*u*) before nasals shows a tendency to separation. The nasalization of *i* and *u* (= Modern French *u*) did not take place till the 16th century; and in all cases the loss of the following nasal consonant is quite modern, the older pronunciation of *tant, ombre* being *tānt, ombrə*, not as now *tã, ōbrh.* The nasalization took place whether the nasal consonant was or was not followed by a vowel, *femme* (*fēminam*), *honneur* (*honōrem*) being pronounced with nasal vowels in the first syllable till after the 16th century, as indicated by the doubling of the nasal consonant in the spelling, and by the phonetic change (in *femme* and other words) next to be men-

tioned. English generally has *au* (now often reduced to *a*) for Old French *ã—vaunt* (*vanter, vānitāre*), *tawny* (*tanné*, (?) Celtic). (8.) The assimilation of *ẽ* (nasal *e*) to *ã* (nasal *a*) did not begin till the middle of the 11th century, and is not yet universal in France, though generally a century later. In the Alexis nasal *a* (as in *tant*) is never confounded with nasal *e* (as in *gent*) in the assonances, though the copyist (a century later) often writes *a* for nasal *e* in unaccented syllables, as in *amfant* (*enfant, infantem*); in the Roland there are several cases of mixture in the assonances, *gent*, for instance, occurring in *ant* stanzas, *tant* in *ent* ones. English has several words with *a* for *e* before nasals—*rank* (*rang*, Old French *renc*, Teutonic *hriṅga*), *pansy* (*pensée, pēnsātam*); but the majority show *e—enter* (*entrer, intrāre*), *fleam* (*flamme*, Old French *fleme, phlebotomum*). The distinction is still preserved in the Norman of Guernsey, where *an* and *en*, though both nasal, have different sounds—*lànchier* (*lancer, lanceāre*), but *mèntrie* (Old French *menterie*, from *mentīrī*). (9.) The loss of *s*, or rather *z*, before voiced consonants began early, *s* being often omitted or wrongly inserted in 12th century MSS.—Earliest Old French *masle* (*masculum*), *sisdre* (*sīceram*); Modern French *mâle, cidre*. In English it has everywhere disappeared—*male, cider;* except in two words, where it appears, as occasionally in Old French, as *d—meddle* (*mêler, misculāre*), *medlar* (*néflier*, Old French also *meslier, mespilārium*). The loss of *s* before voiceless consonants (except *f*) is about two centuries later, and it is not universal even in Parisian—Early Old French *feste* (*festam*), *escuier* (*scūtārium*); Modern French *fête, écuyer*, but *espérer* (*spērāre*). In the north-east *s* before *t* is still retained—Walloon *chestai* (*château, castellum*), *fiess* (*fête*). English shows *s* regularly—*feast, esquire*. (10.) Medial *dh* (soft *th*, as in *then*), and final *th* from Latin *t* or *d* between vowels, do not begin to disappear till the latter half of the 11th century. In native French MSS. *dh* is generally written *d*, and *th* written *t*; but the German scribe of the Oaths writes *adjudha* (*adjūtam*), *cadhuna* (Greek *katá* and *ūnam*); and the English one of the Alexis *cuntretha* (*contrātam*), *lothet* (*laudātum*), and that of the Cambridge Psalter *heriteth* (*hērēditātem*). Medial *dh* often drops even in the last-named MSS., and soon disappears; the same is true for final *th* in Western French—Modern French *contrée, loué*. But in Eastern French final *th*, to which Latin *t* between vowels had probably been reduced through *d* and *dh*, appears in the 12th century and later as *t*, rhyming on ordinary French final *t*—Picard and Burgundian *pechiet* (*peccātum*), *apelcit* (*appellātum*). In Western French some final *ths* were saved by being changed to *f*—Modern French *soif* (*sitim*), *mœuf* (obsolete, *modum*). English has one or two instances of final *th*, none of medial *dh—faith* (*foi, fidem*); middle English *caritep* (*charité, caritātem*), *druð* (Old French *drū*, Teutonic *drūd*); generally the consonant is lost—*country, charity*. Middle High German shows the Eastern French final consonant—*moraliteit* (*moralité, mōrālitātem*). (11.) *T* from Latin final *t*, if in an Old French unaccented syllable, begins to disappear in the Roland, where sometimes *aimet* (*amat*), sometimes *aime*, is required by the metre, and soon drops in all dialects. The Modern French *t* of *aime-t-il* and similar forms is an analogical insertion from such forms as *dort-il* (*dormit*), where the *t* has always existed. (12.) The change of the diphthong *ai* to *èi* and afterwards to *èè* (the doubling indicates length) had not taken place in the earliest French documents, words with *ai* assonating only on words with *a*; in the Roland such assonances occur, but those of *ai* on *è* are more frequent—*faire* (*facere*) assonating on *parastre* (*patraster*) and on *estes* (*estis*); and the MS. (half a century later than the poem) occasionally has *ei* and *e* for *ai—recleimet* (*reclāmat*), *desfere* (*disfacere*), the latter agreeing with the Modern French sound. Before nasals (as in *laine* = *lānam*) and *ié* (as in *payé* = *pācātum*), *ai* remained a diphthong up to the 16th century, being apparently *ei*, whose fate in this situation it has followed. English shows *ai* regularly before nasals and when final, and in a few other words—*vain* (*vain, vānum*), *pay* (*payer, pācāre*), *wait* (*guetter*, Teutonic *wahtēn*); but before most consonants it has usually *èè—peace* (*pais, pācem*), *feat* (*fait, factum*). (13.) The loss or transposition of *i* (= *y*-consonant) following the consonant ending an accented syllable begins in the 12th century—Early Old French *glorie* (*glōriam*), *estudie* (*studium*), *olie* (*olium*); Modern French *gloire, étude, huile*. English sometimes shows the earlier form—*glory, study;* sometimes the later—*dower* (*douaire*, Early Old French *doarie, dōtārium*), *oil* (*huile*). (14.) The vocalization of *l* preceded by a vowel and followed by a consonant becomes frequent at the end of the 12th century; when preceded by open *è*, an *a* developed before the *l* while this was a consonant—11th century *salse* (*salsa*), *beltet* (*bellitātem*), *solder* (*solidāre*); Modern French *sauce, beauté, souder*. In Parisian, final *èl* followed the fate of *èl* before a consonant, becoming the triphthong *èau*, but in Norman the vocalization did not take place, and the *l* was afterwards rejected—Modern French *ruisseau*, Modern Guernsey *russé* (*rīvicellum*). English words of French origin sometimes show *l* before a consonant, but the general form is *u—scald* (*échauder, excalidāre*), *Walter* (*Gautier*, Teutonic *Waldhari*); *sauce, beauty, soder*. Final *èl* is kept—*veal* (*veau, vitellum*), *seal* (*sceau, sigillum*). (15.) In the east and centre *éi* changes to *òi*, while the older sound is retained in the northwest and west—Norman *estreit* (*étroit, strictum*), *preie* (*proie, praedam*), 12th century Picard, Parisian, etc., *estroit, proie*. But the earliest (10th century) specimens of the latter group of dialects have *éi—pleier* (*plcyer, plicāre*) Eulalia, *mettreiet* (*mettrait, mittere, habēbat*) Jonah. Parisian *òi*, whether from *ei* or from Old French *òi, ói*, became in the 15th century *uè* (spellings with *oue* or *oe* are not uncommon—*mirouer* for *miroir, mīrātōrium*), and in the following, in certain words, *è*, now written *ai—française, connaître*, from *françois* (*franceis, franciscum*), *conoistre* (*conuistre, cognōscere*); where it did not undergo the latter change it is now *ua* or *wa—roi* (*rei, rēgem*), *croix* (*cruis, crūcem*). Before nasals and palatal *l*, *ei* (now = *è*) was kept—*veine* (*vēna*), *veille* (*vigilā*), and it everywhere survives unlabialized in Modern Norman—Guernsey *ételle* (*étoile, stēlla*) with *é*, *ser* (*soir, sērum*) with *è*. English shows generally *ei* (or *ai*) for original *ei—strait* (*estreit*), *prey* (*preie*); but in several words the later Parisian *oi—coy* (*coi, quiētum*), *loyal* (*loyal, lēgālem*). (16.) The splitting of the vowel-sound from accented Latin *ō* or *u* not in position, represented in Old French by *o* and *u* indifferently, into *u*, *o* (before nasals), and *eu* (the latter at first a diphthong, now = German *ö*), is unknown to Western French till the 12th century, and is not general in the east. The sound in 11th century Norman was much nearer to *u* (Modern French *ou*) than to *ó* (Modern French *ó*), as the words borrowed by English show *uu* (at first written *u*, afterwards *ou* or *ow*), never *óó*; but was probably not quite *u*, as Modern Norman shows the same splitting of the sound as Parisian. Examples are—Early Old French *espose* or *espuse* (*spōnsam*), *nom* or *num* (*nōmen*), *flor* or *flur* (*flōrem*); Modern French *épouse, nom, fleur;* Modern Guernsey *goule* (*gueule, gulam*), *nom, flleur*. Modern Picard also shows *u*, which is the regular sound before *r—flour;* but Modern Burgundian often keeps the original Old French *ó—vo* (*vous, vōs*). English shows almost always *uu—spouse, noun, flower* (Early Middle English *spuse, nun, flur*); but *nephew* with *éu* (*neveu, nepōtem*). (17.) The loss of the *u* (or *w*) of *qu* dates from the end of the 12th century—Old French *quart* (*qvartum*), *quitier* (*qviētāre*) with *qu* = *kw*, Modern French *quart, quitter* with *qu* = *k*. In Walloon the *w* is preserved—*couâr* (*quart*), *cuitter;* as is the case in English—*quart, quit*. The *w* of *gw* seems to have been lost rather earlier, English having simple *g—gage* (*gage*, older *guage*, Teutonic *wadi*), *guise* (*guise*, Teutonic *wīsa*). (18.) The change of the diphthong *òu* to *uu* did not take place till after the 12th century, such words as *Anjou* (*Andegāvum*) assonating in the Roland on *fort* (*fortem*); and did not occur in Picardy, where *òu* became *au—caus* from older *còus, còls* (*cous, collōs*) coinciding with *caus* from *calz* (*chauds, calidōs*). English keeps *òu* distinct from *uu—vault* for *vaut* (Modern French *voûte, volvitam*), *soder* (*souder, solidāre*). (19.) The change of the diphthong *ié* to simple *é* is specially Anglo-Norman; in Old French of the Continent these sounds never rhyme, in that of England they constantly do, and English words show, with rare exceptions, the simple vowel—*fierce* (Old French *fiers, ferus*), *chief* (*chief, caput*), with *ie* = *ee*; but *pannier* (*panier, panārium*). At the beginning of the modern period, Parisian dropped the *i* of *ie* when preceded by *ch* or *j—chef, abréger* (Old French *abregier, abbreviāre*); elsewhere (except in verbs) *ie* is retained—*fier* (*ferum*), *pitié* (*pietātem*). Modern Guernsey retains *ie* after *ch—ap'rchier* (*approcher, adpropeāre*). (20.) Some of the Modern French changes have found their places under older ones; those remaining to be noticed are so recent that English examples of the older forms are superfluous. In the 16th century the diphthong *au* changed to *ao* and then to *ó*, its present sound, rendering, for instance, *maux* (Old French *mals, malōs*) identical with *mots* (*muttōs*). The *au* of *eau* underwent the same change, but its *e* was still sounded as *ə* (the *e* of *que*); in the next century this was dropped, making *veaux* (Old French *vēels, vitellōs*) identical with *vaux* (*vals, vallēs*). (21.) A more general and very important change began much earlier than the last; this is the loss of many final consonants. In Early Old French every consonant was pronounced as written; by degrees many of them disappeared when followed by another consonant, whether in the same word (in which case they were generally omitted in writing) or in a following one. This was the state of things in the 16th century; those final consonants which are usually silent in Modern French were still sounded, if before a vowel or at the end of a sentence or a line of poetry, but generally not elsewhere. Thus a large number of French words had two forms; the Old French *fort* appeared as *fòr* (though still written *fort*) before a consonant, *fòrt* elsewhere. At a later period final consonants were lost (with certain exceptions) when the word stood at the end of a sentence or of a line of poetry; but they are generally kept when followed by a word beginning with a vowel. (22.) A still later change is the general loss of the vowel (written *e*) of unaccented final syllables; this vowel preserved in the 16th century the sound *ə*, which it appears to have had in Early Old French. In later Anglo-Norman final *ə* (like every other sound) was treated exactly as the same sound in Middle English; that is, it came to be omitted or

rctained at pleasure, and in the 15th century disappeared. In Old French tho loss of final *ə* is confined to a few words and forms; the 10th century *saveiet* (*sapēbat* for *sapiēbat*) became in the 11th *saveit*, and *ore* (*ad hōram*) *ele* (*illam*) develop the abbreviated *or, el*. In the 15th century *ə* before a vowel generally disappears—*mûr*, Old French *mëur* (*mātūrum*); and in the 16th, though still written, *ə* after an unaccented vowel, and in the syllable *ent* after a vowel, doos the same—*vraiment*, Old French *vraiement* (*vērācā mente*); *avoient* two syllables, as now (*avaient*), in Old French threo syllables (as *habēbant*). These phenomena occur much earlier in the anglicized French of England—14th century *aveynt* (Old French *aveient*). But the universal loss of final *c*, which has clipped a syllable from half the French vocabulary, did not take place till the 18th century, after the general loss of final consonants; *fort* and *forte*, distinguished at tho end of a sentence or lino in the 16th century as *fȯrt* and *fȯrtə*, remain distinguished, but as *fȯr* and *fȯrt*. The metre of poetry is still constructed on the obsolete pronunciation, which is even revived in singing; "dîtes, la jeune belle," actually four syllables (*dit, la zhœn bèl*), is considered as seven, fitted with music accordingly, and sung to fit the musio (*ditə, la zhœnə bèlə*). (23.) In Old French, as in the other Romanic languages, the stress (force, accent) is on the syllable which was accented in Latin; compare the treatment of the accented and unaccented vowels in *latrō, amās*, giving *lére, áime*, and in *latrōnem, amātis*, giving *larón, améz*, the accented vowels being those which rhyme or assonate. At present, stress in French is much less marked than in English, German, or Italian, and is to a certain extent variable; which is partly the reason why most native French scholars find no difficulty in maintaining that the stress in living Modern French is on the same syllable as in Old French. Tho fact that stress in the French of to-day is independent of length (quantity) and pitch (tone) largely aids the confusion; for though the final and originally accented syllable (not counting the silent *e* as a syllable) is now generally pronounced with less force, it very often has a long vowel with raised pitch. In actual pronunciation the chief stress is usually on the first syllable (counting according to the sounds, not the spelling), but in many polysyllables it is on the last but one; thus in *caution* the accented (strong) syllable is *cau*, in *occasion* it is *ca*. Poetry is still written according to the original place of the stress; the rhyme-syllables of *larron, aimez* are still *ron* and *mez*, which when set to music receive an accented (strong) note, and are sung accordingly, though in speech the *la* and *ai* generally have the principal stress. In reading poetry, as distinguished from singing, the modern pronunciation is used, both as to the loss of the final *ə* and the displacement of the stress, the result being that the theoretical metre in which tho poetry is written disappears. (24.) In certain cases accented vowels were lengthened in Old French, as before a lost *s*; this was indicated in the 16th century by a circumflex—*bête*, Old French *beste* (*bestiam*), *âme*, Old French *anme* (*anima*). The same occurred in the plural of many nouns, where a consonant was lost beforo the *s* of the flexion; thus singular *coc* with short vowel, plural *cos* with long. The plural *cos*, though spelt *cocs* instead of *cȯ* (=*kȯȯ*), is still sometimes to be heard, but, like other similar ones, is generally refashioned after the singular, becoming *kȯk*. In present French, except where a difference of quality has resulted, as in *côte* (Old Frenoh *coste, costam*) with *ȯ* and *cotte* (Old French *cote*) with *ɔ*, short and long vowels generally run together, quantity being now variable and uncertain; but at the beginning of this century the Early Modern distinctions appear to have been gencrally preserved.

(*d*) *Orthography.*—The history of French spellings is based on that of French sounds; as already stated, the former (apart from a few Latinisms in the earliest documents) for several centuries faithfully followed the latter. When the popular Latin of Gaul was first written, its sounds were represented by the letters of the Roman alphabet; but these were employed, not in the values they had in the time of Cæsar, but in those they had acquired in consequence of the phonetic changes that had meantime taken place. Thus, as the Latin sound *u* had become *ȯ* (close *o*) and *ū* had become *y* (French *u*, German *ü*), the letter *u* was used sometimes to denote the sound *ȯ*, sometimes the sound *y*; as Latin *k* (written *c*) had become *tsh* or *ts*, according to dialect, before *e* and *i*, *c* was used to represent those sounds as well as that of *k*. The chief features of early French orthography (apart from the specialties of individual MSS., especially the earliest) are therefore these:—*c* stood for *k* and *tsh* or *ts*; *d* for *d* and *dh* (soft *th*); *e* for *é, è*, and *ə*; *g* for *g* and *dzh*; *h* was often written in words of Latin origin where not sounded; *i* (*j*) stood for *i*, *y* consonant, and *dzh*; *o* for *ȯ* (Anglo-Norman *u*) and *ɔ*; *s* for *s* and *z*; *t* for *t* and *th*; *u* (*v*) for *ȯ* (Anglo-Norman *u*), *y*, and *v*; *y* (rare) for *i*; *z* for *dz* and *ts*. Some new sounds had also to be provided for: where *tsh* had to be distinguished from non-final *ts*, *ch*, —at first, as in Italian, denoting *k* before *i* and *e* (*chi*=*ki* from *qvī*)—was used for it; palatal *l* was represented by *ill*, which when final usually lost one *l*, and after *i* dropped its *i*; palatal *n* by *gn, ng*, or *ngn*, to which *i* was often prefixed; and the new letter *w*, originally *uu* (*vv*), and sometimes representing merely *uv* or *vu*, was employed for the consonant-sound still denoted by it in English. All combinations of vowel-letters represented diphthongs; thus *ai* denoted *a* followed by *i*, *ou* either *ȯu* or *ɔu*, *ui* either *ȯi* (Anglo-Norman *ui*) or *yi*, and similarly with the others—*ei, eu, oi, iu, ie, ue* (and *oe*), and the triphthong *ieu*. Silent letters, except initial *h* in Latin words, are very rare; though MSS. copied from older ones often retain letters whose sounds, though existing in the language of the author, had disappeared from that of the more modern scribe. The subsequent changes in orthography are due mainly to changes of sound, and find their explanation in the phonology. Thus, as Old French progresses, *s*, having become silent before voiced consonants, indicates only the length of the preceding vowel; *e* before nasals, from the change of *é* (nasal *e*) to *ā* (nasal *a*), represents *ā*; *c*, from the change of *ts* to *s*, represents *s*; *qu* and *gu*, from the loss of the *w* of *kw* and *gw*, represent *k* and *g* (hard); *ai*, from the change of *ai* to *è*, represents *è*; *ou*, from the change of *ɔu* and *ȯu* to *u*, represents *u*; *ch* and *g*, from the change of *tsh* and *dzh* to *sh* and *zh*, represent *sh* and *zh*; *eu* and *ue*, originally representing diphthongs, represent *œ* (German *ö*); *z*, from the change of *ts* and *dz* to *s* and *z*, represents *s* and *z*. The new values of some of these letters were applied to words not originally spelt with them: Old French *k* before *i* and *e* was replaced by *qu* (*evesque, eveske*, Latin *episcopum*); Old French *u* and *o* for *ȯ*, after this sound had split into *eu* and *u*, were replaced in the latter case by *ou* (*rous*, for *ros* or *rus*, Latin *russum*); *s* was inserted to mark a long vowel (*pasle, pale*, Latin *pallidum*); *eu* replaced *ue* and *oe* (*neuf, nuef*, Latin *novum* and *novem*); *z* replaced *s* after *é* (*nez, nes, nāsum*). The use of *x* for final *s* is due to an orthographical mistake; the MS. contraction of *us* being something like *x* was at last confused with it (*iex* for *ieus, oculōs*), and, its meaning being forgotten, *u* was inserted before the *x* (*yeux*), which thus meant no more than *s*, and was used for it after other vowels (*voix* for *vois, vōcem*). As literature came to be extensively cultivated, traditional as distinct from phonetic spelling, began to be influential; and in the 14th century, the close of the Old French period, this influence, though not overpowering, was strong—stronger than in England at that time. About the same period there arose etymological as distinct from traditional spelling. This practice, the alteration of traditional spelling by the insertion or substitution of letters which occurred (or were supposed to occur) in the Latin (or supposed Latin) originals of the French words, became very prevalent in the three following centuries, when such forms as *debvoir* (*dēbēre*) for *devoir, faulx* (*falsum*) for *faus, autheur* (*auctōrem*, supposed to be *authōrem*) for *auteur, poids* (supposed to be from *pondus*, really from *pēnsum*) for *pois*, were the rule. But besides the etymological, there was a phonetic school of spelling (Ramus, for instance, writes, *èime, èimaţes*—with *e*=*é*, *è*=*è*, and *ç*=*ə*—for *aimai, aimastes*), which, though unsuccessful on the whole, had some effect in correcting the excesses of the other, so that in the 17th century most of these inserted letters began to drop; of those which remain, some (*flegme* for *flemme* or *fleume*, Latin *phlegma*) have corrupted the pronunciation. Some important reforms—as the dropping of silent *s*, and its replacement by a circumflex over the vowel when this was long; the frequent distinction of close and open *e* by acute and grave accents; the restriction of *i* and *u* to the vowel sound of *j* and *v* to the consonant; and the introduction from Spain of the cedilla to distinguish *c*=*s* from *c*=*k* before *a, u*, and *o*—are due to the 16th century. The replacement of *oi*, where it had assumed the value *è*, by *ai*, did not begin till the last century, and was not the rule till the present one. Indeed, since the 16th century the changes in French spelling have been very small, compared with the changes of the sounds; final consonants and final *e* (unaccented) are still written, though the sounds they represent have disappeared. French orthography is now quite as traditional and unphonetic as English, and gives an even falser notion than this of the actual state of the language it is supposed to represent. Many of the features of Old French orthography, early and late, are preserved in English orthography; to it we owe the use of *c* for *s* (Old English *c*=*k* only), of *j* (*i*) for *dzh*, of *v* (*u*) for *v* (in Old English

written *f*), and probably of *ch* for *tsh*. The English *w* is purely French, the Old English letter being the runic p. When French was introduced into England, *kw* had not lost its *w*, and the French *qu*, with that value, replaced the Old English cp (*queen* for cpen). In Norman, Old French *ó* had become very like *u*, and in England went entirely into it; *o*, which was one of its French signs, thus came to be often used for *u* in English (*come* for *cume*). *U*, having often in Old French its Modern French value, was so used in England, and replaced the Old English *y* (*busy* for *bysi*, Middle English *brud* for *brȳd*), and *y* was often used for *i* (*day* for *dai*). In the 13th century, when *ou* had come to represent *u* in France, it was borrowed by English, and used for the long sound of that vowel (*sour* for *sūr*); and *gu*, which had come to mean simply *g* (hard), was occasionally used to represent the sound *g* before *i* and *e* (*guess for gesse*). Some of the Early Modern etymological spellings were imitated in England; *fleam* and *autour* were replaced by *phlegm* and *authour*, the latter spelling having corrupted the pronunciation.

(*e*) *Inflexions.*—In the earliest Old French extant, the influence of analogy, especially in verbal forms, is very marked when these are compared with Latin (thus the present participles of all conjugations take *ant*, the ending of the first, Latin *antem*), and becomes stronger as the language progresses. Such isolated inflexional changes as *saveit* into *savoit*, which are cases of regular phonetic changes, are not noticed here.

i. *Verbs.*—(1.) In the oldest French texts the Latin pluperfect (with the sense of the perfect) occasionally occurs—*avret* (*habuerat*), *roverct* (*rogāverat*); it disappears early in the 12th century. (2.) The *u* of the ending of the 1st pers. plur. *mus* drops in Old French, except in the perfect, where its presence (as ə) is not yet satisfactorily explained—*amoms* (*amāmus*), but *amames* (*amāvimus*). In Picard the ending *mes* is extended to all tenses, giving *amomes*, etc. (3.) The replacement of the 2d plur. ending *eiz* (Latin *ētis*) by the *ez* (Latin *ātis*) of the first conjugation begins early in Norman; in the Roland both forms occur, *portereiz* (*portāre habētis*) assonating on *rei* (*roi*, *rēgem*), and the younger *porterez* on *citet* (*cité*, *cīvitātem*). In Eastern French, where *ez*, in accordance with phonetic laws, appears as *eiz*, *ciz* for the same reason becomes *oiz* and *oïs*, and is found in the 13th century—*avois* and *avroiz* corresponding to *aveiz* (*habētis*) and *avreiz*, but *ameiz* to *amez* (*amātis*). (4.) In Eastern French the 1st plur., when preceded by *i*, has *e*, not *o*, before the nasal, while Western French has *u* (or *o*), as in the present; *posciomes* (*posseāmus*) in the Jonah homily makes it probable that the latter is the older form—Picard *aviemes*, Burgundian *aviens*, Norman *aviums* (*habēbāmus*). (5.) The subjunctive of the first conjugation has at first in the singular no final *s*, in accordance with the final vowel laws—*plur*, *plurs*, *plurt* (*plōrem*, *plōrēs*, *plōret*). The forms are gradually assimilated to those of the other conjugations, which, deriving from Latin *am*, *as*, *at*, have *e*, *es*, *e(t)*; Modern French *pleure*, *pleures*, *pleure*, like *perde*, *perdes*, *perde* (*perdam*, *perdās*, *perdat*). (6.) In Old French the present subjunctive and the 1st sing. pres. ind. generally show the influence of the *i* or *e* of the Latin *iam*, *eam*, *iō*, *eō*—Old French *muire* or *moerge* (*moriat* for *moriātur*), *tiegne* or *tieuge* (*teneat*), *muir* or *moerc* (*moriō* for *morior*), *tieng* or *tienc* (*teneō*). By degrees these forms are levelled under the other present forms—Modern French *meuer* and *meure* following *meurt* (*morit* for *morītur*), *tienne* and *tiens* following *tient* (*tenet*). A few of the older forms remain—the vowel of *ais* (*habeam*) and *ai* (*habeō*) contrasting with that of *a* (*habet*). (7.) A levelling of which instances occur in the 11th century, but which is not yet complete, is that of the accented and unaccented stem-syllables of verbs. In Old French many verb-stems with shifting accent vary in accordance with phonetic laws—*parler* (*parabolāre*), *amer* (*amāre*) have in the present indicative *parol* (*parabolō*), *paroles* (*parabolās*), *parolet* (*parabolat*), *parlums* (*parabolāmus*), *parlez* (*parabolātis*), *parolent* (*parabolant*); *aim* (*amō*), *aimes* (*amās*), *aimet* (*amat*), *amums* (*amāmus*), *amez* (*amātis*), *aiment* (*amant*). In the first case the unaccented, in the second the accented form has prevailed—Modern French *parle*, *parler*; *aime*, *aimer*. In several verbs, as *tenir* (*tenēre*), the distinction is retained—*tiens*, *tiens*, *tient*, *tenons*, *tenez*, *tiennent*. (8.) In Old French, as stated above, *ié* instead of *é* from *a* occurs after a palatal (which, if a consonant, often split into *i* with a dental); the diphthong thus appears in several forms of many verbs of the 1st conjugation—*preier* (= *prei-ier*, *precāre*), *vengier* (*vindicāre*), *laissier* (*laxāre*), *aidier* (*adjūtāre*). At the close of the Old French period, those verbs in which the stem ends in a dental replace *ie* by the *e* of other verbs—Old French *laissier*, *aidier*, *laissiez* (*laxātis*), *aidiez* (*adjūtātis*); Modern French *laisser*, *aider*, *laissez*, *aidez*, by analogy of *aimer*, *aimez*. The older forms generally remain in Picard—*laissier*, *aidier*. (9.) The addition of *s* to the 1st sing. pres. ind. of all verbs of the first conjugation is rare before the 13th century, but is usual in the 15th; it is probably due to the analogy of the third person—Old French *chant* (*cantō*), *aim* (*amō*); Modern French *chante*, *aime*. (10.) In the 13th century *s* is occasionally added to the 1st pers. sing., except those ending in *e* (= ə) and *ai*, and to the 2d sing. of imperatives; at the close of the 16th century this becomes the rule, and extends to imperfects and conditionals in *oie* after the loss of their *e*. It appears to be due to the influence of the 2d pers. sing.—Old French *vend* (*vendō* and *vende*), *vendoie* (*vendēbam*), *parti* (*partīvī*), *ting* (*tenuī*); Modern French *vends*, *vendais*, *partis*, *tins*; and *donne* (*dōnā*) in certain cases becomes *donnes*. (11.) The 1st and 2d plur. of the pres. subj., which in Old French were generally similar to those of the indicative, gradually take an *i* before them, which is the rule after the 16th century—Old French *perdons* (*perdāmus*), *perdez* (*perdātis*); Modern French *perdions*, *perdiez*, apparently by analogy of the imp. ind. (12.) The loss in Late Old French of final *s*, *t*, etc., when preceding another consonant, caused many words to have in reality (though often concealed by orthography) double forms of inflexion—one without termination, the other with. Thus in the 16th century the 2d sing. pres. ind. *dors* (*dormīs*) and the 3d *dort* (*dormit*) were distinguished as *dòrz* and *dòrt* when before a vowel, as *dòrs* and *dòrt* at the end of a sentence or line of poetry, but ran together as *dòr* when followed by a consonant. Still later, the loss of the final consonant when not followed by a vowel further reduced the cases in which the forms were distinguished, so that the actual French conjugation is considerably simpler than is shown by the customary spellings, except when, in consequence of an immediately following vowel, the old terminations occasionally appear. Even here the antiquity is to a considerable extent artificial or delusive, some of the insertions being due to analogy, and the popular language often omitting the traditional consonant or inserting a different one. (13.) The subsequent general loss of *e* = ə in unaccented final syllables has still further reduced the inflexions, but not the distinctive forms—*perd* (*perdit*) and *perde* (*perdat*) being generally distinguished as *pèr* and *pèrd*, and before a vowel as *pèrt* and *pèrd*.

ii. *Substantives.*—(1.) In Early Old French (as in Provençal) there are two main declensions, the masculine and the feminine; with a few exceptions the former distinguishes nominative and accusative in both numbers, the latter in neither. The nom. and acc. sing. and acc. plur. mas. correspond to those of the Latin 2d or 3d declension, the nom. plur. to that of the 2d declension. The sing. fem. corresponds to the nom. and acc. of the Latin 1st declension, or to the acc. of the 3d; the plur. fem. to the acc. of the 1st declension, or to the nom. and acc. of the 3d. Thus masc. *tors* (*taurus*), *lere* (*latrō*); *tor* (*taurum*), *laron* (*latrōnem*); *tor* (*taurī*), *laron* (*latrōuī* for *-nēs*); *tors* (*taurōs*), *larons* (*latrōnēs*); but fem. only *ele* (*āla* and *ālam*), *flor* (*flōrem*); *eles* (*ālās*), *flores* (*flōrēs* nom. and acc.). At the end of the 11th century feminines not ending in *e* = ə take, by analogy of the masculines, *s* in the nom. sing., thus distinguishing nom. *flors* from acc. *flor*. A century later, masculines without *s* in the nom. sing. takes this consonant by analogy of the other masculines, giving *leres* as nom. similar to *tores*. In Anglo-Norman the accusative forms very early begin to replace the nominative, and soon supersede them, the language following the tendency of contemporaneous English. In Continental French the declension-system was preserved much longer, and did not break up till the 14th century, though acc. forms are occasionally substituted for nom. (rarely nom. for acc.) before that date. In the 15th century the modern system of one case is fully established; the form kept is almost always the accusative (sing. without *s*, plural with *s*), but in a few words, such as *fils* (*fīlius*), *sœur* (*soror*), the nom. survives in the sing., and occasionally both forms exist, in different senses—*sire* (*senior*) and *seigneur* (*seniōrem*), *on* (*homō*) and *homme* (*hominem*). (2.) Latin neuters are generally masculine in Old French, and inflected according to their analogy, as *ciels* (*caelus* for *caclum* nom.) *ciel* (*caelum* acc.), *ciel* (*caelī* for *caela* nom.), *ciels* (*caelōs* for *caela* acc.); but early cases of nom. sing. without *s* occur, which, if not due to substitution of acc. for nom., are the older forms (*ciel* = *caelum* nominative). Many neuters lose their singular form and treat the plural as a feminine singular, as in the related languages—*merveille* (*mīrābilĭa*), *feule* (*folia*). But in a few words the neuter plural termination is used, as in Italian, in its primitive sense—*carre* (*carra*, which exists as well as *carrī*), *deie*, later *doie* (*digita* for *digitī*); Modern French *chars*, *doigts*. This form became extinct after the 13th century—*paire* (Latin *paria*), in Old French both fem. sing. and neut. plur. (as Italian *paja* is fem. plur.), being now only the former. (3.) In Old French the inflexional *s* often causes phonetic changes in the stem; thus palatal *l* before *s* takes *t* after it, and becomes dental *l*, which afterwards changes to *u* or drops—*fil* (*fīlium* and *fīlī*) with palatal *l*, *filz* (*fīlius* and *fīliōs*), afterwards *fiz*, with *z* = *ts* (preserved in English *Fitz*), and then *fis*, as now (spelt *fils*). Many consonants before *s*, as the *t* of *fiz*, disappear, and *l* is vocalized—*vif* (*vīvum*), *mal* (*malum*), nominative sing. and acc. plur. *vis*, *maus* (earlier *mals*). These forms of the plural are retained in the 16th century, though often etymologically spelt with the consonant of the

singular, as in *vifs*, pronounced *vis*; but in Late Modern French many of them disappear, *vifs*, with *f* sounded as in the singular, being the plural of *vif*, *bals* (formerly *baux*) that of *bal*. In many words, as *chant* (*cantūs*) and *champs* (*campōs*) with silent *t* and *p* (Old French *chans* in both cases), *maux* (Old French *mals*, sing. *mal*), *yeux* (*oculōs*, Old French *oelz*, sing. *oeil*) the old change in the stem is kept. Sometimes, as in *cieux* (*caelōs*) and *ciels*, the old traditional and the modern analogical forms coexist, with different meanings. (4.) The modern loss of final *s* (except when kept as *z* before a vowel) has seriously modified the French declension, the singulars *fort* (*fòr*) and *forte* (*fòrt*) being generally undistinguishable from their plurals *forts* and *fortes*. The subsequent loss of *s* in finals has not affected the relation between sing. and plur. forms; but with the frequent recoining of the plural forms on the singular present Modern French has very often no distinction between sing. and plur., except before a vowel. Such plurals as *maux* have always been distinct from their singular *mal*; in those whose singular ends in *s* there never was any distinction, Old French *laz* (now spelt *lacs*) corresponding to *laqveus*, *laqveum*, *laqveī*, and *laqveōs*.

iii. *Adjectives.*—(1) The terminations of the cases and numbers of adjectives are the same as those of substantives, and are treated in the preceding paragraph. The feminine generally takes no *e* if the masc. has none, and if there is no distinction in Latin—fem. sing. *fort* (*fortem*), *grant* (*grandem*), fem. plur. *forz* (*fortēs*), *granz* (*grandēs*), like the acc. masc. Certain adjectives, which in Provençal take an *a* not existing in Latin, take the corresponding *e* in Old French—fem. *dulce* (*douce*, *dulciam* for *dulcem*, Provençal *dolza*), masc. *dulz* (*dulcem*). In the 11th century some other feminines, originally without *e*, begin in Norman to take this termination—*grande* (in a feminine assonance in the Alexis), plur. *grandes*; but other dialects generally preserve the original form till the 14th century. In the 16th century the *e* is general in the feminine, and is now universal, except in a few expressions—*grand' mère* (with erroneous apostrophe, *grandem mātrem*), *lettres royaux* (*līterās rēgālēs*), and most adverbs from adjectives in *-ant*, *-ent*—*couramment* (*currante* for *-ente mente*), *sciemment* (*sciente mente*). (2.) Several adjectives have in Modern French replaced the masc. by the feminine—Old French masc. *roit* (*rigidum*), fem. *roide* (*rigidam*); Modern French *roide* for both genders. (3.) In Old French several Latin simple comparatives are preserved—*maiur* (*majōrem*), nom. *maire* (*major*); *graignur* (*grandiōrem*), nom. *graindre* (*grandior*); only a few of these now survive—*pire* (*pejor*), *meilleur* (*meliōrem*), with their adverbial neuters *pis* (*pejus*), *mieux* (*melius*). The few simple superlatives found in Old French, as *merme* (*minimum*), *proisme* (*proximum*), *haltisme* (*altissimum*), are now extinct. (4.) The modern loss of many final consonants when not before vowels, and the subsequent loss of final *e*, have greatly affected the distinction between the masc. and fem. of adjectives—*fort* and *forte* are still distinguished as *fòr* and *fòrt*, but *amer* (*amārum*) and *amère* (*amāram*), with their plurals *amers* and *amères*, have run together.

(*f*) *Derivation.*—Most of the Old French prefixes and suffixes are descendants of Latin ones, but a few are Celtic (*et* = *ittum*) or Teutonic (*ard* = *hard*), and some are later borrowings from Latin (*arie*, afterwards *aire*, from *ārium*). In Modern French many old affixes are hardly used for forming new words; the inherited *ier* (*ārium*) is yielding to the borrowed *aire*, the popular *contre* (*contrā*) to the learned *anti* (Greek), and the native *ée* (*ātam*) to the Italian *ade*. The suffixes of many words have been assimilated to more common ones; thus *sengler* (*singulārem*) is now *sanglier*.

(*g*) *Syntax.*—Old French syntax, gradually changing from the 10th to the 14th century, has a character of its own, distinct from that of Modern French; though when compared with Latin syntax it appears decidedly modern.

(1.) The general formal distinction between nominative and accusative is the chief feature which causes French syntax to resemble that of Latin and differ from that of the modern language; and as the distinction had to be replaced by a comparatively fixed word-order, a serious loss of freedom ensued. If the forms are modernized while the word-order is kept, the Old French *l'archevesque ne puet flechir li reis Henris* (Latin *archiepiscopum nōn potest flectere rēx Henrīcus*) assumes a totally different meaning—*l'archevêque ne puet fléchir le roi Henri*. (2.) The replacement of the nominative form of nouns by the accusative is itself a syntactical feature, though treated above under inflection. A more modern instance is exhibited by the personal pronouns, which, when not immediately the subject of a verb, occasionally take even in Old French, and regularly in the 16th century, the accusative form; the Old French *je qui suï* (*ego qvī sum*) becomes *moi qui suis*, though the older usage survives in the legal phrase *je, soussigné. . . .* (3.) The definite article is now required in many cases where Old French dispenses with it—*jo cunquis Engleterre, suffrir mort* (as Modern French *avoir faim*); Modern French *l'Angleterre, la mort*. (4.) Old French had distinct pronouns for "this" and "that"—*cest* (*ecce istum*) and *cel* (*ecce illum*), with their cases. Both exist in the 16th century, but the present language employs *cet* as adjective, *cel* as substantive, in both meanings, marking the old distinction by affixing the adverbs *ci* and *là*—*cet homme-ci, cet homme-là; celui-ci, celui-là*. (5.) In Old French, the verbal terminations being clear, the subject pronoun is usually not expressed—*si ferai* (*sīc facere habeō*), *est durs* (*dūrus est*), *que feras* (*qvid facere habēs*)? In the 16th century the use of the pronoun is general, and is now universal, except in one or two impersonal phrases, as *n'importe, peu s'en faut*. (6.) The present participle in Old French in its uninflected form coincided with the gerund (*amant* = *amantem* and *amandō*), and in the modern language has been replaced by the latter, except where it has become adjectival; the Old French *complaingnans leur dolours* (Latin *plañgentēs*) is now *plaignant leurs douleurs* (Latin *plañgendō*). The now extinct use of *estre* with the participle present for the simple verb is not uncommon in Old French down to the 16th century —*sont disanz* (*sunt dīcentēs*) = Modern French *ils disent* (as English *they are saying*). (7.) In present Modern French the preterite participle when used with *avoir* to form verb-tenses is invariable, except when the object precedes (an exception now unknown to the conversational language)—*j'ai écrit les lettres, les lettres que j'ai écrites*. In Old French down to the 16th century, formal concord was more common (though by no means necessary), partly because the object preceded the participle much oftener than now—*ad la culur muée* (*habet colōrem mūtātam*), *ad faite sa venjance, les turs ad rendues*. (8.) The sentences just quoted will serve as specimens of the freedom of Old French word-order,—the object standing either before verb and participle, between them, or after both. The predicative adjective can stand before or after the verb—*halt sunt li pui* (Latin *podia*), *e tenebrus e grant*. (9.) In Old French *ne* (Early Old French *nen*, Latin *nōn*) suffices for the negation without *pas* (*passum*), *point* (*punctum*) or *mie* (*mīcam*, now obsolete), though these are frequently used—*jo ne sui tis sire* (*je ne suis pas ton seigneur*), *autre feme nen ara* (*il n'aura pas autre femme*). In principal sentences Modern French uses *ne* by itself only in certain cases—*je ne puis marcher, je n'ai rien*. The slight weight as a negation usually attached to *ne* has caused several originally positive words to take a negative meaning,—*rien* (Latin *rem*) now meaning "nothing" as well as "something." (10.) In Old French interrogation was expressed with substantives as with pronouns by putting them after the verb—*est Saul entre les prophetes?* In Modern French the pronominal inversion (the substantive being prefixed) or a verbal periphrasis must be used—*Saul est-il*, or *est-ce que Saul est*.

(*h*) *Summary.*—Looking at the internal history of the French language as a whole, there is no such strongly marked division as exists between Old and Middle English, or even between Middle and Modern English. Some of the most important changes are quite modern, and are concealed by the traditional orthography; but, even making allowance for this, the difference between French of the 11th century and that of the 19th is less than that between English of the same dates. The most important change in itself and for its effects is probably that which is usually made the division between Old and Modern French, the loss of the formal distinction between nominative and accusative; next to this are perhaps the gradual loss of many final consonants, the still recent loss of the vowel of unaccented final syllables, and the extension of analogy in conjugation and declension. In its construction Old French is distinguished by a freedom strongly contrasting with the strictness of the modern language, and bears, as might be expected, a much stronger resemblance than the latter to the other Romanic dialects. In many features, indeed, both positive and negative, Modern French forms a class by itself, distinct in character from the other modern representatives of Latin.

IV. *Bibliography.*—The few works which treat of French philology as a whole are now in many respects antiquated, and the important discoveries of the last few years, which have revolutionized our ideas of Old French phonology and dialectology, are scattered in various editions, periodicals, and separate treatises. For many things Diez's *Grammatik der Romanischen Sprachen* (4th edition—a reprint of the 3d—Bonn, 1876–77; a French translation, Paris, 1872–75, is to be followed by a supplementary volume by G. Paris) is still very valuable; Burguy's *Grammaire de la Langue d'oïl* (2d edition—a reprint of the 1st—Berlin, 1869–70) is useful only as a collection of examples. G. Paris's edition of *La Vie de S. Alexis* (Paris, 1872) was the pioneer of, and retains an important place among, the recent original works on Old French; Darmesteter and Hatzfeld's *Le Seizième Siècle* (Paris, 1878) contains the first good account of Early Modern French. The leading periodicals now in existence are the *Romania* (Paris), founded (in 1872) and edited by P. Meyer and G. Paris; and the *Zeitschrift für Romanische Philologie* (Halle), founded (in 1877) and edited

by G. Gröber. To these reference should be made for information as to the very numerous articles, treatises, and editions, by the many and often distinguished scholars who, especially in France and Germany, now prosecute the scientific study of the language. It may be well to mention that, Old French phonology especially being complicated, and as yet incompletely investigated, these publications, the views in which are of various degrees of value, require not mere acquiescent reading, but critical study. (H. N.)

PART IV.—FRENCH LITERATURE.

The intellectual history of France is certainly unique. It is the history of a race which has ever been in the van of modern European thought, which has conquered more by its mind than by its arms, which has conferred upon the world gifts whose value is not to be calculated by any material standard. It is the history of a nation to which the supremacy of the soul has always been as dear as the supremacy of the sword, and which has more than once asserted that supremacy at the very moment when its military and political influence have been most in dispute. We have to deal with a people essentially spirited and intellectual, whose spirit and intellect have been invariably the wonder and admiration, if not the model and mould, of contemporary human thought, and whose literary triumphs remain to this day amongst the most notable landmarks of universal literature. If we set on one side the master-minds of England, it is to France that we must look for the great lights of modern days, the great pioneers of modern thought, the great leaders of modern intelligence. From France have come the poets whose burning words inflamed the dull hearts of the middle ages, the dramatists who reared the classical stage of the seventeenth century, the mathematicians who opened up to our gaze the marvellous simplicities of astronomical truths, the logicians and metaphysicians who taught the solid mind to revolve in the orbit of rational faith, the historians who first reduced the chaos of tradition to a science, and emulated, with hereditary genius, the simplicity and concision of Livy and Tacitus. To her, above all, we owe the orderly and logical discrimination of ideas, arrangement of thoughts, clearness and severity of expression, readiness of deduction and elegance of diction, without which a literature can appear at the best but a splendid heap of unknown and unclassified gems.

The intellectual history of France is the history of a nation which, though Gallic or Celtic in its origin, is a legitimate heir of the ancient Latin race — a race in which Englishmen themselves have an interest of relationship, and in whose transmitted genius we must necessarily feel a hearty sympathy wherever we meet with its traces. France represents in a special degree the development of the Latin civilization, more fully, if not more directly, than Italy. She was the chosen, if not the natural home, of Roman culture and refinement during the later years of the Empire's decline, even before the transference of the sceptre from Italy to Byzantium had robbed the seat of the Cæsars of its principal allurements. The last of the Roman emperors set Gaul in their affections higher than the city which had been the boast and glory of their ancestors, and Gaul herself returned the embrace of her conquerors with all the enthusiasm of fascination. Roman arts, Roman letters, Roman habits and fashions, became the touchstone of the simple Gauls, and of the still more impressionable Franks, who, in their turn, conquered and were absorbed by Gaul.

Influence of Greece on Gaul.

The most remote influences of Greek civilization on Gaul were probably those which came into the train of Phœnician commerce. With the earliest Phœnicians there appear to have come a number of Rhodian settlers, who christened the Rhone (Rhodanus) after their native island, and built a town on its banks which bore the name of Rhodamisia.

The lower Rhone was, from the earliest historic period, a busy artery of commerce, as was the Loire on the west, with the thriving town of Corbilo at its mouth. Not only from historical records, such as the writings of Polybius, but also from coins and inscriptions, we learn that Greek Civilization in various forms, religion, political institutions, commerce, the Greek alphabet, and to a certain extent the Greek language, existed in Gaul before the incursions of the Romans became frequent.

The troubadours in particular, affected the graceful thought and style of Theocritus; and their work may be described rather as rivalling than as merely imitating the Greek model. M. Fauriel pushes the observation still further, maintaining that the *aubades* and the *sérénades*, a *genre* which we might think so essentially French in its flavour, are but themes upon a note cherished through many ages of recollection from the Greek songs of dawn.

Influence of Rome in Gaul.

After Greece, Rome; in the annals of their national glory in their entry into Gaul, in the order of their influence upon the mind of France, in the degree of authority exerted by their respective civilisations, Greece, the commercial nation, had charmed and penetrated her hosts by her poetry, her rhetoric, her arts; Rome, the military nation, remodelled her victims by her laws, her administration, her moral vigor.

It was in letters as in society and politics; the intellectual existence of Gaul, as well as her physical existence, was to be inextricably interwoven with that of her Roman conquerors. Gaul's destiny was to follow the principal phases of contemporary Latin literature; and she began forthwith to play her part. Hence arises one of the most remarkable features of her early literary history; the great number of Gallic orators, or rather rhetoricans and grammarians, who spoke and wrote in the Latin tongue. Amongst the Gallo-Romans who thus adorned the land of their birth before the prevalence of Christianity, we may name Valerius Cato, Roscius, Varro Atacinus, Cornelius Gallus (immortalised by a dedication of Virgil), Trogus Pompeius, Marcus Aper, Domitius Afer, and Petronius, who, as *Ampiere* pungently observed, "kneaded into statues of exquisite workmanship the Roman filth."

Influence of Germany on Gaul.

Towards the close of the third century another enemy fastened itself upon the doomed country. The Franks crossed the Rhine, and, uniting with their brethren upon the left bank, in the district which has already come to be known as Upper and Lower Germany, overran Gaul, and even Spain.

In the fifth century the Germans proper established themselves in Roman Gaul.

Of the Teutonic invaders who overran the country, the Visigoths occupied Southern Gaul and Spain, overlapping the Iberian race; the Ostrogoths settled in Northern Italy; the Vandals, including Burgundians and Longobards, halted, on their way to Spain, in Eastern Gaul and Italy; the Franks, including the Salians from the Ysel and the Ripuarians from the Rhine, formed the bulk of the newcomers, and spread over the whole of Northern Gaul.

On a winter's day, the last of the year 400, a vast host of Goths, Vandals, Huns, and Allemans crossed the Rhine on the ice, and, pushing westward, gained their first great victory at Moguntiacum (Mainz), where they slaughtered hundreds of citizens in the cathedral. They traversed the country without any notable check, and penetrated even to the extreme south-west. The Bagandes rose again and added to the chaos of slaughter. In 412 came the Visigoths under Ataulf, who, two years afterwards, married Placidia, sister of the Emperor Honorius. The Burgundians seized a new home between the Rhone and the Jura, where the brave Sequanians had once dwelt. They were Christians, and perhaps of all the Teutons the most peaceable, if they met with no opposition.

The speech of the invading Germans was not identical amongst the several tribes; and their dialects were again distinct from the language of the Goths. All were affiliated to the Indo-Teutonic family of

tongues, and bore to each other a closer relationship than did any of them to the Celtic or Iberian. It is not necessary for us to pursue these differences of speech, which have left few corresponding traces in the modern French tongue. It was the adopted Latin of the Gallo-Romans which was finally developed into the French of the troubadours and of the Renaissance; and it was this language which the Franks were compelled to learn before they could govern their new possessions. Nor was the German literature much more influential upon the people who had been fascinated by and who sedulously cultivated the literature of Rome. Nevertheless, it is important that we should bear in mind what the German literature actually was.

The art of poetry, cultivated in some form or other by every nation, however young, was in the Teutonic race the first art brought to anything like perfection. The early poetic literature of the Germans was rich and varied; they not only had the rudimentary lyric poetry common to all warlike tribes — songs of triumph, of mourning, of commemoration,— but they could boast of didactic poems, and of grand national epics like the Nibelungen Lied. The epic commemorating the deeds of the Visigoth Brunhild, wife of Siegbert, King of Austrasia, would indeed rightly belong to the literature of France — as they do to her history — if the Franks of the sixteenth century had not yet been purely German; and had not their epics been written in the German language.

Influence of Christianity.

Practically speaking, the only written literature existing in France for many centuries after the birth of Christ consisted of the Latin and Greek writings of the Christian fathers and doctors, together with the works, in the same ancient tongues, of a few pagan grammarians and rhetoricians. As the popular literature, rarely committed to writing, and sung for the most part in the Iberian, Celtic, or Teutonic language, was confined exclusively to poetry, so these Latin and Greek writings were composed, as a rule, in more or less ornate prose.

The first father of Gaul was Irenæus, one of Polycarp's disciples, and himself a Greek. He never lost his admiration for the Pagan literature of his native country, quoting Homer, Hesiod, Pindar, and the great dramatists.

The only extant work of Irenæus is his *Treatise on Heresies*, wherein he attacks the errors of Gnosticism, and the other primary corruptions of the Christian faith. It is important to observe that already, at the close of the second century, we find emanating from French Christianity two species of documents which were to have a lasting influence upon French literature; namely, the "dogmatic treatise," in a style severe, classical, more or less ornate, and the records of Christian suffering, the basis of future "martyrologies." To these must be added a third species, the letters written from church to church, containing edifying records of the death of children and others, which were read out in an interval of divine service, and which formed the foundation of the "sacred legends," which have in all ages been a speciality of Christian literature.

The Panegyrists.

The panegyrists are the most prominent figures of this period. The Gallo-Romans who could write well seem to have vied with each other in declaiming on the virtues and glories of the great men of their day, from the Emperors downward; and as the Emperors of Rome in her decadence loved Gaul, and frequently resided there, one cannot be at a loss to find probable reasons for the complacencies of these literary men. It speaks little for the national spirit of independence, and less for the self-respect of those whose culture might have raised them above a taste for sycophancy; but the fact remains that these panegyrics, though built upon Greek models, or imitated after the least worthy of the Roman eulogists, were in this age preeminently characteristic of Gallic writers. A collection has been made of twelve *Panegirici Veteres*, as affording a sample of what the third century produced; and ten of these are the work of Gallo-Romans.

The Teachers.

The Christian Church in Gaul in the second century was a Greek Church; in the fourth century it was a Latin Church.

To this century belongs the poet and philosopher Lactantius, an African Roman settled at Treves. He began life as a pagan rhetorician, being a disciple of the African Arnobius. He adopted Christianity during the persecution under Diocletian, and in the year 317 he came to Gaul as a tutor to one of the sons of Constantine. His principal philosophical work is his *Divine Institutions*. He also wrote treatises on the *Anger of God* and on the *Death of Persecutors*. Some are even inclined to credit him with the authorship of the *Phœnix*, a poem in the Ovidian style, though they do so on grounds which are not sufficient to establish more than a probability.

Another Gaul of the fourth century, a native of Bordeaux, successively a professor of rhetoric, the tutor of the Emperor Valentinian's son, and a consul of the empire under his former pupil Gratian, was Ausonius, a Christian imitator of the pagan panegyrists, whose taste clung to pagan literature whilst his heart was given to Christianity.

Ausonius was also a poet, and he celebrates in verse the great cities of antiquity. His *Ordo Nobilium Urbium* enumerates the glories and industries of Rome, Constantinople, Carthage, Alexandria, Antioch, Treves, and other cities.

Ausonius was in addition a dramatist — he wrote the *Play of the Seven Sages*. It is rather a succession of monologues than a drama. The seven sages of Greece are made to appear one after the other, and, after pronouncing a maxim in Greek, expound it in Latin.

The Chroniclers.

Sidonius Apollinaris, a native of Lyons, flourished in the middle of the fifth century. He was converted to Christianity and within three years after his commission was consecrated Bishop. He was not afraid of indulging in pagan illustrations, or of continuing to model his style on that of pagan authors. He is, in fact, the Dean Swift, or better, the Sydney Smith of the Gallic Church.

Amongst the Gallic Christian writers of the fourth century were Paulinus, a poet full of tenderness, a disciple and friend of Ausonius; Martin, a writer of legends and Christian sagas, and an epigrammatist of whom even the monks of his day had cause to be afraid; Hilarius, bishop of Poitiers, a notable opponent of Arianism, exiled to Phrygia on that account by the Council of Béziers, author of a *Treatise on the Trinity*, and other controversial works; Ambrosius, the champion of Christianity against pagan reaction, against the corrupt presumption of the usurper Maximus, to whom he would pay no open honour or deference; and Cassianus, the anchorite, author of *Institutions of Monasteries*, and a volume of *Collations* or dialogues; Vigilantius, a southern Gaul, who protested against the vow of celibacy, and who has been described as "the Gascon Luther;" and Prosper of Aquitaine, who has left us his biography, a *Chronicle*, a volume of *Epigrams*, and a poem on *Grace*.

Forty years after the death of Sidonius was born Gregory, bishop of Tours; and his famous *Ecclesiastical History of the Franks* makes us acquainted with much concerning the progress of letters, and the reactions of religious and civil society, of which we should otherwise have remained in ignorance. He was a general of the Church Militant in Gaul.

Chilpéric, grandson of Clovis, set up as a poet and as a theologian. He was distinguished in the one accomplishment by his false quantities, and in the other by his Arianism.

A contemporary of Gregory was Fortunatus, who passed some years in Chilpéric's court, and wrote verses in honour of Siegbert, Brunhild, and Frédé-

gonde. He had known Boethius in Italy, and had profited by the encouragement shown to letters by Theodoric the Goth. With him, the literature which had its foundation in the reminiscences of the Latin classical writers, died; and the age of the sacred legends began.

Charlemagne, his Labours and his Fellow-workmen.

The history of France in the eighth century reveals a figure of greater prominence and importance than any of those upon whom we have been turning our attention. Karl the great, commonly called Charlemagne, was the son of Pepin the Short, and grandson's son of Pepin of Héristal, an Austrasian Mayor of the Palace, who, after the battle of Testry, was acknowledged as Duke of the Franks. Charlemagne, born A. D. 742, succeeded his father in the kingdom of Neustria in 768, obtained the kingdom of all the Franks three years later, and the crown of Lombardy in 774; assuming the title of Emperor in the year 800. He established schools, and monasteries to which schools were attached, in many parts of his dominions; and settled lecturers, professors, artists, grammarians, wherever it occurred to him that their talents might be used to the best account.

Amongst the schools which owed their foundation, or rather restoration, to the enlightened Emperor at the close of the eighth century, was that attached to the palace, which some have chosen to consider as the origin of the famous University of Paris. The names of his assistants in the grand work of the restoration of learning, and in particular of those who were attached to his person, sufficiently attest the penetration, the good fortune, the success with which he attracted to his side men of genuine intellectual power, well fitted to be the instruments of his farsighted purposes. Of these the principal was Alcuin, who had presided over the famous school connected with the monastery of York.

Two of Alcuin's fellow-workmen were from Ireland; the monkish chronicler of St. Gall describes them as "duos Scotos de Hibernia." Clement, one of them, was a Greek scholar.

Another Irishman, greater than either Alcuin or Clement, lived at the court of Charles the Bald (grandson of Charlemagne through Louis le Débonnaire). This was John Scotus Erigena, who has been called the only really learned man of the Middle ages. Others of Alcuin's contemporaries in France were Smaragdus, who wrote a Latin grammar; Benedict of Aniane, a terror to evil-living monks; Peter of Pisa, brought by the Emperor from Pavia; Paul the Lombard, who has left behind him a *History of the Lombards, a Chronicle of Events*, at Metz, and a continuation of the *Abstract of Euterpius;* and Paulinus of Aquileia, a theologian of no little acuteness and independence.

It is to be observed that the civilization of France during the epoch of Charlemagne and his immediate successor, and, in a still more remarkable degree, the learning and literary culture of France, came from men of foreign extraction. The influences of Christianity had been brought to bear upon the nation by modes and instruments for the most part indigenous, but this restoration of learning in the eighth and ninth centuries must be attributed to causes of external origin. Ampère, in his *Histoire littéraire de la France*, vol. iii., ch. 4, observes, "Before Charlemagne almost all the countries of Western Europe were more advanced than France, and it may be said without national vanity such a state of things was a real anomaly in the history of civilization. Nevertheless so it was in the epoch of barbarism and the decadence of the Merovingians. At that time France was eclipsed by Spain, by Italy, by England. Spain had, in the tenth century, Isidore of Seville. In Italy, after Boetius and Cassiodorus, those latest representatives of antiquity at the moment when antiquity had expired on the threshold of modern ages, two great Popes arose, Saint Leo and Saint Gregory. Later on, whilst the densest darkness covered Gaul, England produced the Venerable Bede, celebrated by the extent of his knowledge. France had no one to compare with these."

Origin of the Langue d'Oc and the Langue d'Oil.

The process whereby the Latin tongue gradually became modified into French was slow and ill defined. We have sufficient evidence that the Latin spoken in France during and shortly previous to the eighth century was very corrupt.

The Latin spoken in the ninth century by the most educated laymen in France — setting aside those who had spent many years in the schools — is exemplified by the well-known oaths of Lewis the German and Charles the Bald, preserved by Nithard, nephew of Charlemagne, in his *History of the Franks*. Here we have evidence both of the extent to which the corruption of the Latin language had proceeded, and of the advance already made towards the modern form of speech. Another and later example is contained in the song St. Eulalia, preserved by Ordericus Vitalis, one of the earliest fragments of the popular poetry, afterwards so abundant, which centered round the lives of the saints, and which was to give place in the affections of the French people to the songs of the troubadours.

The distinction between the early French of the north and the south must have existed from the very first; and it is necessary, to a proper appreciation of French literature, to notice the principal features of each form of language. As early as the thirteenth century, French writers had observed and commented on this difference. The grammarian and troubadour, Raymond Vidal, in his *La Dreyta Manera de Trobar*, remarks: "The French tongue is best and most suitable for the making of romances, pastorals, and lays; but that of Limousin is to be preferred for making verses, songs, and sirventes." Many causes must have contributed to produce the dialects of Limousin, Gascony, and Saintonge, of Auvergne, Toulouse, Narbonne, of Vienne and Montferrat; and the dialects themselves, in a more or less imperfect form, must have been commonly spoken in the various provinces many years before they became the vehicle of literature.

The grand distinction observable amongst the dialects of France is that between the north and the south; and for this the geographical separation would alone be sufficient to account. But other causes, both political and social, must also be taken into account, which are given in the leading histories of France.

These added to the natural influences of a more southern climate, tended to widen and emphasise the difference between the Provençal language and literature and the heavier and ruder speech of the north. The former has been distinguished by the name of *langue d'oc;* the latter by that of *langue d'oil*. M. Gérusez in his *Histoire de la Littérature française*, vol. i., p. 5, remarks that "*oc* is evidently the *hoc* of the Latins; *oil*, of which we have formed our *oui*, which is certainly not, as has been said so often, the past participle of the verb ouïr, is derived, by a double syncope, from *hoc* and *illud*, united and abridged. *Hoc* was pronounced *o*, as *oc* is still pronounced in the south of France. *Illud* has given its first syllable, upon which the tonic accent rests, and our fathers had thus for affirmation the dissyllable *oil*, which is wrongly written and pronounced *oil*. The Italians took for a similar use the adverb *sic*, of which they made *si*. Italian is the language of *si*, just as the romance from the south is the language of *oc*, and that from the centre and the north of France the language of *oil*."

The Langue d'Oc and its Literature.

The language of the South, distinguished from its greater propinquity to Rome as the *langue d'oc* (*noc*), was spoken generally up to the close of the thirteenth century on the banks of the Ebro and of the Po, on the Mediterranean coast, and in the districts drained

by the Loire and the Rhone. Its principal variations were the dialects of Provence, Gascony, Catalonia, and Piedmont; the latter comprising elements which account for its development in the modern Italian, whilst the Catalan dialect tended towards the modern Spanish. In the twelfth century these four forms were sufficiently similar to be intelligible over the whole district just defined, and even by the more cultivated speakers of the *langue d'oil*. Many of the troubadours employed the several dialects indiscriminately, and we shall find them frequently combining the features of all in the same song.

Striking figures are those who stand prominent in the history of southern France during the thirteenth century. The philosophical Albigenses, whose headquarters were at Toulouse but who were spread over a wide district, and whose disciples numbered many thousands; the ascetic Waldenses, the "poor men of Lyons," who would not go beyond the Bible for the rule of their faith — these two sects, against whom all the bitterness of orthodox hatred was to be poured forth, alike distinguished for the purity of their life, and alike rejected by the priestly domination of Rome; Folquèt, the false and unscrupulous Bishop of Toulouse, himself once a gay and gallant troubadour, who, with his culture of the poetic art, had cast off all the grace and tenderness of humanity; Domenico, canon of Osma, the parent and founder of the inquisition, who baptized his offspring in the blood of a thousand victims, and did more than any one man in his generation for the cause of Roman supremacy; Raymond VI., Count of Toulouse, done to death by the basest treachery; Simon de Montfort, succeeding to the honours of his victim, taking henceforth the leading part in this cruel mockery of a crusade; — these are figures worthy the skill of a great painter, grouped as they are in lurid light against the dark background which, in the thirteenth century, began to overlay the land of song.

The Troubadours.

We find in the poetry of the Troubadours a reflection of the age which they have made so memorable; the troubadours came from every stage and rank of feudal society; and as their habits and experiences greatly varied, so also varied the character of their songs. One of the very earliest of the troubadors was Guillaume IX., Count of Poitiers. Poitou, Saintonge, and Guyenne were especially the homes of noble and wealthy poets. In Gascony and in Auvergne the gift and the fashion were more largely present. Elias de Barjols, the son of a shopkeeper, towards the middle of the twelfth century, disputed with Geoffroy Rudel, Prince of Blayes, the palm of verse and courtesy. In Auvergne were born Pierre d'Auvergne and Pierre Rogier, sprung from the people, whose names are immortalised by Petrarch in his *Trionfo d'Amore*. Giraud de Borneilh, Bernard de Ventadour, Gaucelm Faydit, were humble troubadours of Périgord; which at the same time produced the noble-born Canon Guy d'Uisel and his cousin Elias, and perhaps the loftiest genius of Provençal poetry, Arnaud Daniel, who dignified the fashion of verse, and would, if that were possible, have made it the appanage of the refined and learned. But one of the noblest and most warlike troubadours of Périgord, was Bertrand de Born, Lord of Hautefort.

But it was in Provence particularly that the art of the troubadour attained its acme of grace, of courtliness, of subtle and exquisite expression. And the troubadours of Provence were for the most part highly born and delicately nurtured, like Rambaud de Vaquieras, Guy de Cavaillon, the Countess of Die, and other friends and clients of such discriminating patrons as the lords of Orange, the Marquis d'Aupt, the Counts de Vienne and de Forcalquier.

Jongleurs and *jongleresses*, or *jugleresses*, were perhaps in greater request in the south than in the north; and their skill was exercised not only in singing the favourite songs of dead or absent troubadours, and in accompanying the words on a musical instrument, but also, not unfrequently, in performing sleight-of-hand tricks, standing on their heads, walking on their hands, whirling and catching knives, baskets, copper balls and plates, or putting through their paces the bears and monkeys which accompanied them on their travels. As for the social position of the *jongleurs* in the south, it seems to have been much the same as in the north of France, that is to say, at all events no better than that of the wandering acrobats of our own times.

The *chansons*, *canzons*, or *cansos* were, as a rule, the longest and most dignified of the songs of the troubadours, who adopted this style in particular when they wished to deal worthily with the praise of God, of religion or morality, or when they would attach a special element of solemnity to their commendation of the object of their affection. The versification usually consists of decasyllabic couplets, though the rhymes occasionally alternate, and, in finished compositions, correspond in the several stanzas, line for line and rhyme for rhyme. *Chansons* of shorter length and less elevated subject acquired the name of *cansonetta* or *demi-chanson*.

The *sirvente*, which gradually became transferred from subjects of love to subjects of war, and the satire of manners and political abuses, and which has consequently more of fire and sincerity than most Provençal songs, was divided into stanzas like the *chanson*, though both in length and number of lines, and in the succession of rhymes, it was more irregular. Such a style of composition was admirably suited to the impassioned military ardour, the bitter preliminaries, or the triumphant sequels of war.

The *tensons* were discussions usually between knights and lady poets about some delicate love question.

The *aubade* is amongst the most graceful in form and spirit of all Provençal songs, dealing, as it does, with perhaps the loveliest moment of the day — the passing of the darkness and the dawning of the light. The topics interwoven with this distinctive idea are sometimes religious; but here, also, in the great majority of instances, Love exacts the honour due to him.

The *ensenhamen* were popular treatises in rhyme usually addressed to some high-born lord or lady, and containing sage precepts upon the regulation of conduct and etiquette. Amanieu des Escas was a didactic poet of this school, two of whose *ensenhamen* are extant. Nor was prose unpractised in the Romance tongue of the south, even by the troubadours. Rainbaud, Count of Orange, one of the earliest troubadours of Provence proper, has left a poem, every couplet of which is followed by a commentary in prose. The *épitre*, again, was a familiar form of composition, arranged generally in lines of less than ten syllables, which served as a vehicle for petitions, thanks, advice, moral suasion, or instruction. The *trésors* were, as a rule, dreamy and monotonous encyclopedias, charged with meagre reminiscenses of all the facts of art or science which happened to come under the writer's cognisance. That of Pierre de Corbiac consists of some eight hundred and forty alexandrines limited to a single rhyme.

Early Epics of the Langue d'oil.

The trouvères were the makers of the poems wherewith they delighted to cheer all classes, and to rouse their spirits even for war. They took it ill that their less staid and decorous rivals, the *jongleurs*, who were singers rather than poets, should sometimes attract the praises and the rewards of their patrons; they called them *trovéors bâtards*, and asserted that they degraded the noble art; priding themselves especially on their intellectual superiority which enabled them to be original.

The first efforts of the trouvères were partly directed towards the celebration of national heroes; both because the deeds of the illustrious Frenchmen were most familiar to them, and were the subject of greater pride to themselves and to their hearers, and because their poetic genius, still only half-fledged, had not the courage to venture far afield. Some of

the earliest poems of trouvères go as far back as the times of Clovis and Dagobert, whilst others come down almost to contemporary heroes. But of all the epics of the national French cycle, the figure of Charlemagne is the centre, as Arthur is the centre of the epics of Britain.

The name by which the national French epics were usually described was *Chansons de Geste*, from the Latin phrase *res gestæ*, public arts, authentic narrative. Of these *Chansons*, 800 manuscripts have been already (1876) discovered, including those of the Carlovingian, Classical and Arthurian cycles. The word *geste* came to be used as an abstract substantive; *gens de geste* were men of historic fame or ancestry.

The origin and sources of the *Chansons de gestes* have been made a matter of much controversy. According to one theory, we are to look for the origin of the long and regular epics of the eleventh and subsequent centuries in rude compositions, first produced independently, then strung together, and lastly subjected to some process of editing and union. What is certain is that no literary source of the Chansons is now actually in existence, and that we have no authentic information as to any such originals.

A *Chanson de geste* may be defined as a narrative poem, dealing with a subject connected with French history, written in verses of ten or twelve syllables, which verses are arranged in stanzas of arbitrary length, each stanza possessing a distinguishing assonance or rhyme in the last syllable of each line. The assonance, which is characteristic of the earlier Chansons, is an imperfect rhyme, in which identity of vowel sound is all that is necessary. Thus *traitor*, *felon*, *compaingnons*, *manons*, *noz*, the first, fourth, and fifth of which have no character of rhyme whatever in modern poetry, are sufficient terminations for an assonanced poem, because the last vowel sound, o, is identical. There is moreover in this versification a regular cæsura, sometimes after the fourth, sometimes after the sixth syllable; and in a few of the older examples the stanzas, or as they are sometimes called *laisses*, terminate in a shorter line than usual which is not assonanced.

The *Chanson de Roland*, the best known, the longest, and incomparably the finest epic dealing with Charlemagne and the Saracens, illustrates very aptly the best features of the early national poetry of the *Langue d'Oil*. It was probably the work of more than one hand, for the plot bears evidence of having been extended from point to point.

As *Roland* is by far the most interesting of those Chansons which describe the wars of the Saracens, so *Amis et Amiles* may be taken as representing those where the interest is mainly domestic. *Amis et Amiles* is the earliest vernacular form of a story which attained extraordinary popularity in the middle ages, being found in every language and in most literary forms, prose and verse, narrative and dramatic.

One of the grandest of all the early French epics is the *Roman des Loherains*—"the Lorrainers"—which probably dates as far back as the twelfth century. It is an epic of feudal society.

Of the remaining Chansons, the following are the most remarkable. *Aliscans* (twelfth century) deals with the contest between William of Orange, the great Christian hero of the south of France, and the Saracens. This poem forms, according to custom, the centre of the whole group of Chansons dealing with the earlier and later adventures of the hero, his ancestors, and descendants. Such are *Le Couronnement Loys*, *La Prise d'Orange*, *Le Charroi de Nimes*, *Le Moniage Guillaume*. The series formed by these and others is among the most interesting of these groups. *Le Chevalier au Cygne* is a title applied directly to a somewhat late version of an old folk-tale, and more generally to a series of poems connected with the House of Bouillon and the Crusades. The members of this bear the separate headings *Antioche*, *Les Chétifs*, *Les Enfances Godefroy*, etc. This group is terminated by *Baudouin de Sebourc*, a very late but very important Chanson, which falls in with the poetry of the fourteenth century, and the *Bastart de Bouillon*. *La Chevalerie Ogier de Danemarche* is the oldest form in which the adventures of one of the most popular and romantic of Charlemagne's heroes are related. *Fierabras* had also a very wide popularity, and contains some of the liveliest pictures of manners to be found in these poems, in its description of the rough horse-play of the knights and the unfilial behaviour of the converted Saracen princess. This poem is also of much interest philologically. *Garin le Loherain* is the centre of a remarkable group dealing not directly with Charlemagne, but with the provincial disputes and feuds of the nobility of Lorraine. *Raoul de Cambrai* is another of the Chansons which deal with "minor houses," as they are called, in contradistinction to the main Carlovingian cycle. *Gérard de Roussillon* ranks as a poem with the best of all the Chansons. *Hugues Capet*, though very late, is attractive by reason of the glimpses it gives us of a new spirit supplanting that of chivalry proper. In it the heroic distinctly gives place to the burlesque. *Macarie*, besides being written in a singular dialect, in which French is mingled with Italian, supplies the original of the well-known dog of Montargis. *Huon de Bordeaux*, was not only more than usually popular at the time of of the dramatis personæ of *A Midsummer Night's* its appearance, but has supplied Shakespeare with some *Dream*, and Wieland and Weber with the plot of a well-known poem and opera. *Jourdains de Blavies*, the sequel to *Amis et Amiles*, contains, besides much other interesting matter, the incident which forms the centre of the plot of *Pericles*. *Les Quatre Fils Aymon* or *Renaut de Montauban* is the foundation of one of the most popular French chap-books. *Les Saisnes* deals with Charlemagne's wars with Witekind. *Berte aus grans Piés* is a very graceful story of womanly innocence. *Doon de Mayence*, though not early, includes a charming love-episode. *Gérard de Viane* contains the famous battle of Roland and Oliver. The *Voyage de Charlemagne à Constantinople* is semi-burlesque in tone and one of the earliest in which that tone is perceptible.

The spirit of Christianity breathes through these *Chansons de Geste* rather by implication, and through the virtues of chivalrous generosity and self-devotion, than by direct manifestation. In death, however, it is always present.

The Arthurian Cycle.

Arthur is a present from Britain to France. M. H. de Villemarqué has placed the fact beyond doubt. After reading the book, in which he compares with the text before him the romances of the Round Table and the ancient legends of the Britain, we are convinced for example that the British legend of *Owen* preceded and inspired the romance of *Yvain*, or *Le Chevalier au Lion*. It is equally evident that *Pérédur* is the prototye of *Perceval*. We are less certain that the Mael of the British legends is the same person as the Lancelot of the romances, although Mael has in the Gaelic tongue the same signification as Lancelot, or rather Ancelot, which signifies a domestic.

The best of the trouvères who contributed to the Arthurian cycle of *chansons* was Chrétien de Troyes; and his *Chevalier de la Charrette*, independent as it is in its episodes, original as it is in its manner of treatment, yet takes its principal characters from the British epic of Arthur and his Round Table. The "Knight of the Wagon" is Lancelot of the Lake, who, despatched to rescue Guinevere from the caitiff Méléagans, who had carried off the wife destined for King Arthur, loses his horse by the way, and avails himself of the wagon of a peasant. He is successful in his quest, as we know; and too successful for the subsequent happiness of Arthur and Guinevere. The poem is worthy of attention. It is little else than a *fabliau*, in which we meet with grace and archness, and as the trouvère who composed it is a true son of Champagne, the archness is ingenuous. Chrétien de Troyes is a precursor of La Fontaine, with much of the simplicity and pungency of his narrative style.

The incident of the wagon allows him to introduce a spice of comedy into a chivalric subject.

Perceval of Wales is another Arthurian legend, of which the French version, *Perceval le Gallois*, is attributed to Chrétien de Troyes. Perceval was the one knight who, in the quest of the Holy Graal, retained his purity of body and soul with sufficient steadfastness to secure the sacred relic from its guardian. When yet a stripling he escapes from his mother's care, and encounters three of Arthur's knights, whose noble appearance and splendid armour delight his mind and excite his curiosity to the utmost. He observes their coat of mail, and inquires of the knights if they are the God of whom his mother had spoken to him so often.

Le Chevalier au Lion, *Guillaume d'Angleterre*, *Erec et Enide*, *Cliget*, and *Tristan*, have also been attributed to that sweetest of trouvéres, Chrétien de Troyes, who died in the year 1191, Jean Bodel, another trouvère, who lived in the reign of Philip Augustus, wrote the *Chanson des Saxons*, of which the hero is Guiteclin, or Witikind, whose wife, Sebile, is of the class to which Guinevere and Iseult belong, and who has furnished those of her sex who tread in her paths with the time-worn excuse: "What is the use of woman's beauty if she does not employ it in her youth?"

We may here refer to the Anglo-Norman rhyming chroniclers, such as Geoffroy Gaimar, Benoit de Sainte-Maure, and Robert Wace, the latter being the author of the *Romant de Rou* (Rollo), which is little more than a pedigree of the conquerors of Normandy. The prose writer, Geoffry, of Monmouth, by the encouragement of the English king, collected, about A. D. 1140, the ancient traditions of Britain. These were translated from Latin into Romance by Luces du Gast, Gasse le Blond, Walther Map, archdeacon of Oxford, Robert de Borron, Hélie de Borron, Rusticien of Pisa, and the versions were the principal sources from which Chrétien de Troyes, his contemporaries and successors, drew the subjects of their poems.

The Classical Cycle.

It would have been strange if the *trouveres* had overlooked the great heroisms and enthusiams of those ancient civilizations to which their nation owed so much, and in which their adopted tongue had so large and legitimate an interest. Something has already been said of the influence produced on the French national spirit by the history and literature of Greece and Rome; and the illustrations of this influence may now be copiously enlarged. Perhaps the first romance borrowed from the pages of the Greek poets was that of the life of Ulysses.

The first who took the history of the Siege of Troy as the groundwork of his poetical embroidery was Benoit de Sainte-Maure, who lived in England under Henry Beauclerc, and who had the patience to write about thirty thousand lines, as well as another three-and-twenty thousand on the *Historie des ducs de Normandie;* and others both in England and France, followed in his train. But the most important beyond all question of the poems which go to make up this cycle (as it is sometimes called, though in reality its members are quite independent one of the other) is the Romance of *Alixandre*. Of the earliest French poem on this subject only a few fragments exist. This is supposed to have been a work of the eleventh or very early twelfth century, composed in octosyllabic verses, and in the mixed dialect common at the time in the south-east, by Alberic or Auberi of Bescançon or Briançon. The *Chanson d' Alixandre* is, however, in all probability a much more important work than Alberic's. It is in form a regular Chanson de Geste, written in twelve-syllabled verse, of such strength and grace that the term Alexandrine has cleaved ever since to the metre. Its length, as we have it, is 22,606 verses, and it is assigned to two authors, Lambert the Short and Alexander of Bernay, though doubt has been expressed whether any of the present poem is due to Lambert; if we have any of his work it is not later than the ninth decade of the twelfth century. Lambert, Alexander, and perhaps others, are thought to have known not Alberic, but a later ten-syllabled version into Northern French by Simon of Poitiers.

The matter is taken chiefly from Quintus Curtius and the spurious Callisthenes; whilst the treatment is characteristically in the chivalric style, with abundance of the supernatural element. The poem might reasonably adopt as second title "The Mirror of Kings;" for it attributes to Alexander all the royal virtues which would become a monarch in the twelfth century.

Satirical Poems.

The Fabliaux or short verse tales of old France contain satirical delineations of all classes of society. The Fablian according to M. de Montaiglon is "le récit, le plus souvent comique, d'ume aventure réelle ou possible, qui se passe dans les données moyennes de la vie humaine," the recital, for the most part comic, of a real or possible event occurring in the ordinary conditions of human life. M. de Montaiglon, to be rigidly accurate, should have added that it must be in verse, and, with very rare, if any, exceptions, in octosyllabic couplets. Of such Fabliaux, properly so called, we possess perhaps two hundred. They are of the most various length, sometimes not extending to more than a score or so of lines, sometimes containing several hundreds. They are, like most contemporary literature, chiefly anonymous, or attributed to persons of whom nothing is known, though some famous names, especially that of the Trouvere Rutebœuf, appear among their authors. Their period of composition seems to have extended from the latter half of the twelfth century to the latter half of the fourteenth, no manuscript that we have of them being earlier than the beginning of the thirteenth century, and none later than the beginning of the fifteenth.

Les deux Bordeors Ribaux is a dispute between two Jongleurs who boast their skill. It is remarkable for a very curious list of Chansons de Gestes which the clumsy reciter quotes all wrong, and for a great number of the sly hits at chivalry and the chivalrous romances which are characteristic of all this literature. *Le Vair Palefroi* contains the story of a lover who carries off his beloved on a palfrey grey from an aged wooer. *La Housse Partie*, a great favorite, which appears in more than one form, tells the tale of an unnatural son who turns his father out of doors, but is brought to a better mind by his own child, who innocently gives him warning that he in turn will copy his example. *Sire Hain et Dame Anieuse* is one of the innumerable stories of rough correction of scolding wives. *Brunain la Vache au Prestre* recounts a trick played on a covetous priest. In *Le Dit des Perdrix*, a greedy wife eats a brace of partridges which her husband has destined for his own dinner, and escapes his wrath by one of the endless stratagems which these tales delight in assigning to womankind. *Le sot Chevalier*, though extremely indecorous, deserves notice for the Chaucerian breadth of its farce, at which it is impossible to help laughing. The *two Englishmen and the Lamb* is perhaps the earliest example of English-French, and turns upon the mistake which results in an ass's foal being bought instead of the required animal. *Le Mantel Mautaillié* is the famous Arthurian story known in English as "The Boy and the Mantle." *Le Vilain Mire* is the original of Molière's *Médecin malgré lui Le Vilain qui conquist Paradis par Plaist* is characteristic of the curious irreverence which accompanied mediæval devotion. A villein comes to heaven's gate, is refused admission, and successfully silences St. Peter, St. Thomas, and St. Paul, by very pointed references to their earthly weaknesses.

Flore la Courtisane was not a pretty name for a bishop; but under that name a certain Deacon John, the archbishop's favorite, created Bishop of Orléans by favor of the king's mistress Bertrade de Montfort, was the subject of many a pleasant rhyme in the eleventh century.

Landri was also a famous satirical *chanson* written by a priest. King Robert had divorced his wife; the country was under an interdict; and the blame was put upon Count Landri of Auxerre, the reputed lover of the queen. Neither clergy nor people saw why they should be under interdict because Robert had parted with his wife, whom they believed to be unworthy of him; so they sang the song of Landri throughout the country, and even jested at the expense of the Pope. One of Abelard's disciples, Hilarius, wrote a chorus *de Papa Scholastico;* having, of course, the additional incitement of his master's condemnation by Rome. This, too, is in Latin, though it has a Romance refrain.

Roman de Renart. One of the most famous but anonymous poems of the same or immediately succeeding age is the *Roman de Renart.* This *fabliau*, this burlesque poem, this epic *pour rire*, however we may prefer to describe it, though of German origin, became at once vastly popular in France, and was translated before many years had passed into almost all the languages of western Europe.

The apologue of the fox and his companions, *Goupil le Renard*, was added to from time to time, until at last it formed a gigantic story of four-and-twenty thousand verses, called *Le Couronnement de Renard*, *Renard le Nouvel*, *Renard contrefait*, *Renard le Bestonné*. The entire satirical faculty of more than a century may be considered to have been concentrated in this popular and highly edifying *fabliau*. It is, in effect, an epic satire on feudal society, which never failed, in any age, to provide original types of Isengrin the wolf, Tibert the cat, Renard the fox, and —let us be candid — Noble the lion. Throughout the whole romance we never lose sight of the central figure of Renard, impersonation of cunning holding its own against force, who, losing his individuality whilst retaining his spirit, reappears in succeeding generations as the familiar Scapin or Mascarille. It is probable enough that the original fable had a German source, as Jacob Grimm has maintained; but the fact remains that the earliest manuscripts date only from the twelfth century, and that they are in the language of northern France.

The romance of *Renard* comprises some thirty different stories, whereof the authorship of no more than four is known. Two are the works of Pierre de Saint Cloud, one of the curé de la Croix en Brie, the other of Richard de Lison. Much, however, of the best poetry and most striking situations is due to the anonymous trouvères, from one of whom we may borrow a short passage Chantecleer, having lost a daughter by the treachery of Renard, complains to the king of the beasts, who moved with pity, sets his court trembling by his rage, "quant braire oirent lor seignor." He vows vengeance against the murderer, and sends Bruin the bear, Tibert the cat, and Guimbert the badger, one after the other, to summon him to Court. The first two return unsuccessful, and in sorry plight; the third is more fortunate, and brings the caitiff with him. A dozen accusers are eager to heap charges upon Renard, who in the end is condemned to be hanged.

The crafty Renard escapes death by volunteering to go to the Holy Land. Doubtless the fable was true to the life; but he only intends to trick the king, as he has tricked so many of his subjects. Once free, he shuts himself in his castle at Malpertuis, whither Noble, the lion, comes to besiege him. Renard is taken in a sortie, but again makes shift to escape his doom, and lives to thrive and cheat again, and to create incidents for many other pleasant episodes in his career.

The next poem of the cycle is of much greater length, and of at least proportionately greater value, though it has not the freshness and *verve* of the earlier branches. *Renart le Nouvel* was written in 1288 by Jacquemart Giélée, a Fleming, consisting of more than 8,000 lines.

The cycle was finally completed in the second quarter of the fourteenth century by the singular work or works called *Renart le Contrefait*, extending to fully 50,000 lines; in which the wrongs of the common people are bitterly denounced.

Early Lyrics.

The lyric poetry of the middle ages in France divides itself naturally into two periods, distinguished by very strongly marked characteristics. The end of the thirteenth century is the dividing point in this as in many other branches of literature. After that we get the extremely interesting, if artificial, forms of the Rondeau and Ballade, with their many varieties and congeners. With these we shall not busy ourselves at the present period. But the twelfth and thirteenth centuries are provided with a lyric growth, less perfect indeed in form than that which occupied French singers from Machault to Marot, but more spontaneous, fuller of individuality, variety, and vigour, and scarcely less abundant in amount.

Before the twelfth century we find no traces of genuine lyrical work in France. The ubiquitous *Cantilenae* indeed again make their appearance in the speculations of literary historians, but here as elsewhere they have no demonstrable historical existence. Except a few sacred songs, sometimes, as in the case of Saint Eulalie, in early Romance language, sometimes in what the French call *langue farcie*, that is to say, a mixture of French and Latin, nothing regularly lyrical is found up to the end of the eleventh century. But soon afterwards lyric work becomes exceedingly abundant. This is what forms the contents of Herr Karl Bartsch's delightful volume of *Romanzen und Pastourellen*. These are the two earliest forms of French lyric poetry.

The Romance differs in form and still more in subject from the Pastourelle, and both differ very remarkably from the form and manner of Provençal poetry. It has been observed by nearly all students, that the love-poems of the latter language are almost always at once personal and abstract in subject. The Romance and the Pastourelle, on the contrary, are almost always dramatic. The most common form of the Romance is that of a poem varying from twenty lines long to ten times that length and divided into stanzas. These stanzas consist of a certain number (not usually less than three or more than eight) of lines of equal length capped with a refrain in a different metre. The anonymous Romance of 'Bele Grembors' well represents this class.

The Pastourelle is still more uniform in subject. It invariably represents the knight or the poet riding past and seeing a fair shepherdess by his road-side. He alights and woos her with or without success. In this class of poem the stanzas are usually longer, and consist of shorter lines than is the case with the Romances, while the refrains are more usually meaningless though generally very musical. After the twelfth century the early lyrical literature of France undergoes some changes.

We have the *chanson d'amour*, a form less artfully regulated indeed than the corresponding canzon or sestine of the troubadours, but still of some intricacy. It consists of five or six stanzas, each of which has two interlaced rhymes, and concludes with an *Envoi*, which, however, is often omitted. *Chansonnettes* on a reduced scale are also found. In these pieces the alternation of masculine and feminine rhymes, which was ultimately to become the chief distinguishing feature of French prosody, is observable, though it is by no means universal. To the Provençal *tenson* corresponds the *jeu parti* or verse dialogue, which is sometimes arranged in the form of a Chanson. The *salut a'amour* is a kind of epistle, sometimes of very great length and usually in octosyllabic verse, the decasyllable being more commonly used in the Chanson. Of this the *complainte* is only a variety. Again, the Provençal *servente* is represented by the northern *serventois*, a poem in Chanson form, but occupied instead of love with war, satire, religion, and miscellaneous matters. It has even been doubted whether the *serventois* is not the forerunner of the *servente* instead of the reverse being the case. Other forms are *motets*, *vatruenges*, *aubades*. Poems called *rondeaux* and

ballades also make their appearance, but they are loose in construction and undecided in form.

Thibaut IV., Count of Champagne, and King of Navarre, a knight who had perforce followed the King of France in the ruthless expedition against the Albigenses, was bitterly ashamed of his part in the bloody work, and earned partly his absolution by denouncing it in his *Chansons* in burning words: His poems have been more than once reprinted, the last edition being that of M. Tarbé (Rheims 1851); this contains eighty-one pieces, not a few of which, however, are probably the work of others. The majority of them are Chansons d'Amour. Other song writers are Adam de la Halle, Jean Bodel, Guyot de Provins. There are, however, two, Gace Brulé and Colin Muset, who survive solely but worthily as song writers. Gace Brulé was a knight of Champagne, Colin Muset a professed minstrel. Two other poets, Adam de la Halle and Rutebœuf, are far more prominent in literary history. Rutebœuf gives in *La Pauvreté Rutebœuf* and *Le Mariage Rutebœuf*, etc., complaints of his woeful condition. In *Renart le Bestourné*, *Le Dit des Cordeliers*, *Frère Denise*, *Le Dit de l'Erberie*, we have poems of the Fabliau kind. These are all of a personal or comic nature.

In the second class of poems, which is numerous, are displayed a more elevated strain of thought. Many of these poems are *complaintes* or elaborate elegies (often composed on commission) for distinguished persons, such as Geoffroy de Sargines and Guillaume de Saint Amour. Others, such as the *Complainte d'Outremer*, the *Complainte de Constantinople*, the *Dit de la Voie de Tunes*, the *Débat du Croisé et du Décroisé*, are comments on the politics and history of the time.

The third class includes *La Mort Rutebœuf*, otherwise *La Repentance Rutebœuf*, *La Voie de Paradis*, etc. The lyrics which now pass under the name of Marie de France are narrative poems in octosyllabic verse and varying in length considerably. As to Marie herself, nothing is known about her with certainty. She lived in England in the reign of Henry III, and often gives English equivalents for her French words. The *lais* which we possess, written by her and attributed to her, are fourteen in number. They bear the titles of *Gugemer*, *Equitan*, *Le Fresne*, *Le Bisclevere*t, *Lanval*, *Les Deux Amants*, *Ywenec*, *Le Laustic*, *Milun*, *Le Chaitivel*, *Le Chèvrefeuille*, *Eliduc*, *Graalent* and *L'Espine*.

The Decline of the Trouveres.

The reign of Saint Louis (died about 1260) marks an important epoch in the history, language, and literature of France. It was during his reign that the Romance tongue was discouraged and the Romance literature of the troubadours began to fall into oblivion, and it was in his reign likewise that the French of the north became gradually acknowledged as the master tongue of the whole country, whilst its literature as steadily deteriorated.

The *Roman de la Rose* of Guillaume de Lorris, who died about 1260, is a poem of a trouvère of the decadence, of great exquisiteness in style and treatment, with a subject to some extent moulded upon a classical model wholly profane and worldly. It is an *Ars Amandi*, couched in the allegorical language of a Middle-age morality, in form a romance, but in reality a didactic poem on the art of successful love. Its impersonations recall to mind the entities and quiddities of the schoolmen; its nomenclature anticipates, as it may have contributed to suggest, the characters of the *Faery Queene;* Its plan and treatment are not dissimilar to those of the *Flowar and the Leaf*. We are scarcely able from beginning to end to pass from the domain of ideas to that of actual persons and things; the *theory* is present with us throughout, and we are conscious that the author does not himself succeed in translating into practice.

The first part only of the *Roman de la Rose* was written by Lorris. Forty years later, at the instigation of Philip the Fair, 1285–1314, the *Roman de la Rose* was completed by Jean de Meung, who, as we shall find, had virtues of his own, but who did not succeed in catching the spirit, perhaps not even the idea, of his predecessor.

To Guillaume de Lorris and his successors there can be no doubt that Chaucer owed much of his inspiration; and the style of the *Roman de la Rose* every now and again brings forcibly to the mind of the reader some of his happiest reminiscences of the English poet, who wrote more than a century later. The very opening of the Prologue to the *Canterbury Tales* would almost seem to have been modelled upon the first few lines of the older poem.

Jean de Meung is below Guillaume de Lorris in poetic elevation and beauty; he is undoubtedly above him in moral courage, and perhaps also in didactic force. Jean de Meung was a scientist, too, in his way; and there is a gleam of philosophic inspiration in the passages wherein he treats of such subjects as alchemy, astrology, and the operations of nature. One of his best pieces of work is the scene in which he represents nature busied in the conservation of the material universe. She labours, he tells us, in renewing the type of all that fall victims to death; whilst art, the feeble imitator of nature, is on his knees, copying her processes, and attempting to counterfeit her works. But he is ever far behind her, in spite of his cogitations and persistence. The four thousand verses of Guillaume de Lorris contain more clear portraiture and exuberant fancy than the eighteen thousand of his continuator; but he must yield the palm to Jean de Meung, not only in bitter sarcasm and licentious allusion, but also in philosophical reach and in practical effectiveness. The latter part of the poem, in fact, created a more than literary sensation on its first appearance. Jean was a reformer and a Democrat; his work was denounced from the pulpits which he had satirised, and banned in the polite society which his strictures had outraged. Apparently he did not think that zeal for natural morality was worth retaining at the expense of all that was pleasant and comfortable in life, for he retracted in old age the opinions which had gained him so many enemies in his youth.

The imitations of the *Roman de la Rose* were in proportion to its popularity. Much of this imitation took place in other kinds of poetry, which will be noticed hereafter. Two poems, however, which are almost contemporary with its earliest form, and which have only recently been published, deserve mention. One, which is an obvious imitation of Guillaume de Lorris, but an imitation of considerable merit, is the *Roman de la Poire*, where the lover is besieged by Love in a tower. The other, of a different class, and free from trace of direct imitation, is the short poem called *De Venus la Déesse d'Amors*, written in some three hundred four-lined stanzas, each with one rhyme only. Some passages of this latter are very beautiful.

Romans d'Aventures.

Towards the end of the twelfth or the beginning of the thirteenth century a new class of narrative poems arose, derived from each and all of these kinds, but marked by important differences. The new form immediately reacted on the forms which had given it birth, and produced new Chansons de Gestes, new Autherian Romances, and new classical stories fashioned after its own image. This is what is called the Roman d'Aventures, of which the first and main feature is open and almost avowed fictitiousness, and the second the more or less complete abandonment of any attempt at cyclic arrangement or subordination to a central theme.

Adenès or Adans le Roi perhaps derived his surname from the function of king of the minstrels, if he performed it, at the court of Henry III, duke of Brabant. He refashioned three Chansons de Gestes, *Les enfances Ogier*, *Berte aus grans Piés*, and *Bueves de Commarchis*. His last, longest and most important work is the Roman d'Aventures of *Cléomadès*, a poem extending to 20,000 verses, and not less valu-

able for its intrinsic merit than as a type of its class. Its popularity in the middle ages was immense.

Raoul de Houdenc is an earlier poet than Adenès, and represents the Roman d'Aventures in its infancy, when it still found it necessary to attach itself to the great cycle of the Round Table. His works, besides some shorter poems, consist of the *Roman des Eles* (Ailes), a semi-allegorical composition, of *Méraugis de Portlesguez*, an important composition, possessing some marked peculiarities of style; and possibly also of the *Vengeance de Raguidel*, in which the author works out one of the innumerable unfinished episodes of the great epic of *Percevale*.

Other Romans d'Aventures deserve mention. Foremost among these are *Partenopex de Blois* and *Flore et Blanchefleur*. The former (formerly ascribed to Denis Pyramus and now denied to him as author) is a kind of modernised Cupid and Psyche.

Le Roman de Dolopathos has a literary history of great interest which we need not touch upon here. Its versification has more vigor than that of almost any other Roman d'Aventures. *Blancandin et l'Orguilleuse d'Amour* is more promising at the beginning than in the sequel.

Brun de la Montaigne is written in Chanson form, and deals with the famous Forest of Broceliande in Britanny. *Guillaume de Palerne* is a still more interesting work. It introduces the favourite mediæval idea of lycanthropy, the hero being throughout helped and protected by a friendly were — wolf, who, before the end of the poem, is freed from the enchanter's power.

To this class belongs the *Roman* de l'Escouffle, where a hawk carries away the heroine's ring.

Aumadas et Idoine is one of the many stories of the success of a squire of low degree.

Le Bel Inconnu which (from a curious misunderstanding of its older form *Li Biaus Desconnus*) occurs in English form as *Lybius Diasconus*, tells the story of a son of Gawain and the fairy with the white hands, and thus is one of the numerous secondary Romances of the Round Table. So also is the long and interesting *Roman du Chevalier as Deux Espées;* this extends to more than 12,000 lines. A still longer poem (also belonging to what may be called the outer Arthurian cycle) is *Durmart le Gallois*, which contains almost 16,000 verses.

Philippe de Rémy, seigneur de Beaumanoir (who has other claims to literary distinction) is held to be author of two Romans d'Aventures, *La Manekine* (the story of the King of Hungary's daughter who cut off her hand to save herself from her father's incestuous passion) and *Blonde d'Oxford*, where a young French squire carries off an English heiress. *Joufrois de Poitiers*, which has not come down to us complete, is chiefly remarkable for the liveliness of style with which adventures, in themselves tolerably hackneyed, are handled. Other Romans d'Aventures, which are either as yet in manuscript or of less importance, are *Ille et Galeron* and *Eracle*, both by Gautier d'Arras, *Cristal et Larie*, *La Dame à la Licorne*, *Guy de Warwike*, *Gérard de Nevers* or *La Violette*, *Guillaume de Dole*, *Elédus et Séréna*, *Florimont*.

The last original Chanson *Baudouin de Sebourc* and its sequel the *Bastard of Bouillon*, worthily close this great division of literature, and setting as they do a finish to the sub-cycle of the *Chevalier au Cygne*, hardly lose except in simplicity by comparison with its magnificent opening in the *Chanson d'Antioche*. They contain together some 33,000 verses, and the scene changes freely. Putting two or three masterpieces aside, no poem of mediæval times has a more varied and livelier interest than *Baudouin de Sebourc*, and few breathe the genuine Chanson spirit of pugnacious piety better than *the Bastard of Bouillon*.

TROUVERES OF THE FOURTEENTH CENTURY.

Later Songs and Poems.—The later songs and poems were more artificial in form than the earlier, although they rapidly rose into great popularity. They represent almost the soul surviving poetic spirit of France in an age of comparative literary sterility, when there was little besides them of freshness, beauty, or originality. The forms in which they were cast were various. And these new or newly perfected styles were well suited to the not very sustained efforts of these poets. The ballad most in favor with the age consisted of two or more stanzas rhymed on an identical model, all ending with the same line. The *rondeau*, in its earlier shape, had eight lines, the first, fourth, and seventh being identical, as were the second and last. The *virelai* turned on two rhymes, of which the first had to predominate throughout the whole; the first verses were repeated together or separately, as often as necessary; hence the name.

The *chant royal* was a kind of major ballade having five of the longest (eleven-lined) stanzas and an envoy of five lines. The *rondel* was a poem of thirteen lines (sometimes made into fourteen by an extra repetition), consisting of two quatrains and a five-lined stanza, the first two lines of the first quatrain being repeated as the last two of the second, and the first line of all being added once more at the end.

The *triolet* was a sort of rondel of eight lines only, repeating the first line at the fourth, and the first and second at the seventh and eighth. Lastly, the *villanelle* alternated one of two refrain lines at the end of each three-lined stanza. These were the principal forms, though there were many others.

The chief authors of these pieces during this period were Eustache Deschamps, a most prolofic trouvère, his friend Guillaume de Machault, musician and poet, the chronicler Froissart, Jehannot de Lescurel, Christine de Pisan, Alain Chartier, and Charles d'Orléans. Besides these there were many others of less distinction.

PROSE-WRITERS OF THE THIRTEENTH CENTURY.

The vulgar tongue, which was called *lingua romana*, to distinguish it from both pure Latin and from Teutonic, but which was not commonly known as French until the ninth century, had been from the fifth or sixth century the language of the great majority of Frenchmen. Up to the fourteenth century, however, this popular form of speech, so far as prose is concerned, was rather a spoken than a written tongue; although it may be taken for granted that any language in common use, which was daily and familiarly spoken, must also occasionally have been written in prose.

Prose Romance documents, in addition to those above named, are to be met with from the eleventh century onwards. Godfrey of Bouillon caused the *Assises du Royaume de Jérusalem* to be written in French, and Thomas de Couci gives us in the same language the well-known law of Vervins. To Picardy the Abbé Lebeuf attributes certain Romance translations of the *Book of Job*, the two *Books of the Kings*, and the *Dialogues of Saint Gregoire;* whereas in England we have prose Romance works from the pens of several of Henry Beauclerk's assistants, such as Wace, Walter Map and Fantosme.

It was in the thirteenth century that Frenchmen began to write their history in their own tongue, and laid the foundations of what has since proved to be one of the characteristic excellences of French literature. Nursed by the grand epics in which their fathers and grandfathers had sung the glories of ancient and modern prowess, the noble adventures of chivalry, and the mighty exploits of kings, they began to record in serious earnest the events in which they had themselves borne part, and which they felt ought not to be lost upon their children. For the most part, doubtless, it was the men who thought themselves unequal to the task of writing a worthily-sustained poem to whom the idea first occurred of setting forth a matter-of-fact narrative in prose. Froissart, it is true, had an ardent poetic genius, but it was exclusively in the lyric vein, and he would have shrunk from the idea of composing his chronicles in verse. Naturally enough the historic narratives which claim our attention were, to begin with, simple and unambitious records, candid and even

colloquial in style, and much in the manner of a protracted letter to a friend.

The special historic genius of the nation was manifested by Villehardouin, Joinville and Froissart.

Gregory of Tours, Eginhard, the so-called Turpin, and Hincmar have supplied many a fact which would otherwise have been lost to us; but their records are far from trustworthy. The patriotic labours of the Benedictines of the Abbey of Saint Denis, which have bequeathed to posterity an invaluable collection of historic documents, did much to redeem the cloister from the reproach which rests upon it; and Suger himself, to whom the grand idea was probably due, came nearest of all his order to the possession of the genuine historic gift. He wrote the annals of at least one of the reigns in which he occupied so prominent a position, but his narrative exhibits the dimness of perception which was fatal to all the monastic writers. After him came several other historians.

Rigord, Guillaume le Breton, the anonymous writer of the lives of Saint Louis and Louis the Bald, and Guillaume de Nangis, who brought his chronicles down to the year 1340, and last of the Latin chroniclers, the anonymous author of the reign of Charles VI. Rarely have these monastic records been translated, and still more rarely read, in their original form. Nevertheless, we must render justice to the same Abbey of Saint Denis, which gave the French in their own tongue a collection of the *Chroniques de France*.

The first French historian whose work was originally written in the common form of speech is also — and the fact must be emphasised as one of special significance — the first noteworthy writer of French prose. This was Geoffroy de Villehardouin, a soldier and diplomatist, who was born about the middle of the twelfth century, and who died in the year 1213. In 1199 he was sent by Thibault III. of Champagne to treat with the Republic of Venice for the passage of the troops of the fourth crusade through their country. He was himself a soldier of the Cross, and was present at the taking of Constantinople. These events he describes in his *Histoire de la Conquête de Constantinople* — the work of a soldier, simple if somewhat stiff in manner, bearing every mark of fidelity to fact, but not wanting in ambitious passages and in complacent efforts after rhetoric. Villehardouin probably thought he was writing a poem, and would, in any case, have held that the events recorded by him deserved a poetic dress as much as the subjects of the grandest *Chansons de Geste*. And yet he had the true feeling of the historian, giving us with great minuteness the enumeration of the hosts, the plans and deliberations of the chiefs, the position of the opposing armies, the varying fortunes of the struggle; whilst he forgets neither the causes nor the issues of the war, so far as he was able to discern them. He is the Xenophon of his own history, having himself been an actor in all which he narrates; a fact which adds a special freshness and vigour to his account. He was, as a consequence, more than the Mandeville of French prose, for his subject was more purely historical, and he had the art of laying down the model and practice of historic narrative. He had precisely that dignity which Froissart needed, though it was left to Froissart to excel him in graphic and picturesque description.

Amongst the labours of the Abbey of Saint Denis, one of the most serviceable was the translation of the old Latin chronicles, a work undertaken by the monk Primat, at the suggestion of Matthieu de Vendôme, in the year 1274. The originals turned to account by Primat were very numerous. They include the Chronicle of Aimoin, *Gesta Dagoberti*, *Gesta Regum*, the Chronicle of Siegbert, Eginhard, Saint Bertin, Guillaume de Jumièges, Hugues de Fleuri, the works of Suger, and many others.

The translation was clearly and judiciously effected, and it has been largely drawn upon in every succeeding age for the materials of the early history of France.

An historical fragment by Nicholas de Senlis, commencing with the Trojan war, and coming rapidly down as far as the Merovingian period, the date whereof may be assigned to the first or second decade of the thirteenth century, shows that the cultivation of a prose style extended to a dialect which is neither Southern nor Northern.

The work of Estienne Boilesve, or Boileau, whose life covered the first seventy years of the thirteenth century, and who was *prévôt* of Paris under Louis IX., derives its chief value from the fact of its making us acquainted with the police regulations of the capital in his day, with the rules of the ancient trade corporations, and the nature and amount of the taxes levied upon the city for the benefit of the king.

A contemporary of Boilesve's, who died in the same year, was a lawyer of no mean repute, Pierre de Fontaines; to whom Saint Louis, perplexed by any complicated questions of justice, was wont to apply for assistance, saying, "Judge this case." He has left behind him a treatise on the Roman law, as it had been accepted and interpreted in France. His language is rude and difficult, or must at least have appeared so, even at that time, to the Parisians. It is, in fact, the Picard dialect, but even more archaic.

Another jurisconsult was Philippe de Remi, lord of Beaumanoir, who left behind him a reputation as the French Justinian, so able and so profound, that, until the time of Montesquieu, France produced none who can be compared to him.

The method and manner of his work, in his book *des Coutumes et Usages de Beauvoisis*, as well as the style of his prose as it was written by cultivated Frenchmen at the end of the thirteenth century, are certainly very deserving. Beaumanoir was also a poet, and several of his pieces, of no great literary merit, are extant.

They are two long tales in verse, *La Manekine* (the Woman without Hands) and *Jehan et Blonde* (of Oxford), a Beauvaisian epic, interspersed with criticism on English manners and language; *Li saluz d'amours*, *La Complaints d'amours*, a tale of *Fole larguece*, and several other songs.

The list of the prose writers of the thirteenth century is by no means exhausted; and it might easily be extended to proportions too great for our present purpose. Lorens, a preaching friar, who wrote the *Somme des Vices et des Vertus*, better known under the short title of *Somme le Roi*, from the fact of its having been suggested by Philip III.; Agnès d'Harcourt, abbess of Longchamps, who wrote the life of Isabella, sister of Saint Louis; Marguerite de Duyn, prioress of Poletin, the authoress of a book of meditations; the anonymous author of a touching account of the last moments of Jeanne, Countess of Alençon (died 1292), are amongst the writers who in this century set their mark upon the earlier prose literature of France.

Prose-Writers of the Fourteenth Century.

One other great figure arrests our notice in the group of noble and intellectual men whereof Saint Louis is the centre; the figure of a man who had fought by the good king's side, and sat at his feet, who served him faithfully in life and perhaps still better in death; for Jean, Sire de Joinville, not only wrote the *Memoirs* of his royal master, but by that means assisted to secure his canonisation.

If Joinville appears, by his writings, less sustained and dignified than his predecessor, Villehardouin, less concise and supple in expression, he is at all events more reflective, more thoughtful, more redundant in idea and language, and more rich in vocabulary. The two have many virtues of manner and form in common; and if each is to be credited with particular and distinctive marks, they have yet deservedly come down to posterity bracketed together as the first two masters of the French historic style.

To Villehardouin and Joinville in the thirteenth century succeeded Froissart (1337–1410) and Commines (1445–1509) in the fourteenth — chroniclers worthy to tread in the steps of the fathers of French history, prose-writers who carried on the traditions

of their masters to the verge of the Renaissance. Jean Froissart, a native of Valencienne in Hainault, became canon and treasurer of the collegiate church of Chimay in Normandy. He was a poet as well as a chronicler, but his poetic genius was lyrical, and for his history he found no medium so much under his command as the simple, nervous and agreeable prose which entitles him to be regarded as a legitimate descendant of the *chroniqueurs de geste*. Such indeed he was, in spirit as well as in style.

Froissart was a favourite of the English court; and had lived also in Scotland, Spain and Gascony. He was, in short, a cosmopolitan; he spoke, thought and wrote like one.

At the suggestion of Philippa's father, Robert of Namur, he wrote the chronicles on which his fame is built. The first edition bore for its title, *Chroniques de France, d'Angleterre, d'Ecosse, d'Espagne, de Bretagne, de Gascogne, de Flandre et pays d'alentour*.

Philippe de Commines, a native of Lille, is chiefly known as the historian of Louis XI., but Charles VIII. employed him also in diplomatic negotiations, and he was present at the battle of Fornovo. Louis XII. did not use his talents, and thus he employed his leisure in writing his *Mémoires*.

Another prose-writer was Christine de Pisan; the first Frenchwoman who, at all events in prose, gave evidence of a finished literary perception. Brought up at the court of Charles V. until she was seventeen years old, she was happy in the king's protection. Upon the death of her patron she published a panegyric, under the title of *Les Faits et bonnes Moeurs du sage Roi Charles V.*

There can be no doubt that Christine de Pisan had studied the ancient classical, or post-classical models, and that she deserved the praise which Marot lavished on her "knowledge and teaching." The forerunner of Marguerite de Valois, Christine was born out of her time. She, too, belonged to the Renaissance; and her star would have shown more brightly in a brighter atmosphere. She also wrote verses, and some of them show great naturalness of expression, as well as delicacy of feeling.

The Church and the Drama—The Bible Plays.

The Church in the Middle Ages adopted the drama as a handmaid peculiarly fitted to do her worthy and valuable service. For, in demanding that men should dispense with and despise the pleasures of the senses which the world had to offer them, and in cutting off the source of such compensation as they might have obtained through the intellect, it became necessary that she should herself minister to the natural demands of humanity, and provide in her own domain the attraction which she forbade them to seek outside. She expanded the worship of God into a spectacle, the sacred edifice into a theatre, the altar into a stage. The work was thoroughly and admirably done; the rude, simple, ignorant people learned to attend upon the offices of religion with eager anticipation, as affording to them the brightest and lightest moments of their lives. They came away, not mystified or wearied by what they had heard and seen, but charmed and refreshed. Without, they had cares and troubles, anxieties and pains; within, they had pleasant and appetising food for eye and ear, for imagination and reflection. The church was, in fact, the club of the Middle Ages, always open, always peaceful and cheerful, nearly always entertaining. The whole social life of the age appears to have taken refuge within the church.

The first Christian drama was a gesture; it was by a succession of gestures that the priests and their assistants were constrained to illustrate and interpret their dead-letter of devotion. On Ascension day a priest was wont to stand in his surplice upon the outer gallery of Nôtre Dame, and, with outstretched arms, represent the assumption of Christ into heaven. On the feast of Pentecost a dove figured the presence of the Holy Ghost, whilst tongues of fire descended from the roof of the church. At Easter, three men, dressed in white robes, with hoods upon their heads, a silver flask of consecrated oil in their hands, interpreted the story of the three Marys proceeding to the sepulchre, whilst a fourth, in the form of an angel, announced to them the resurrection of their Lord. At Christmas, the infant Jesus was shown in his manger, the Magi and the shepherds gathered round, the youngest choristers playing the parts of angels from the galleries. From spectacles such as these not even the lower animals were excluded; the oxen present at the birth of Christ, the ass which carried Him into Egypt, the cock which crowed the conviction of Peter—all were admitted.

Theatrical companies of quite a different complexion were those of the *Enfants Sans-Souci* and the *Clercs de la Basoche*, who, with the simplest possible stage and accessories, contented themselves with playing farces and *soties*, although they were not long in rising to the level of poetical dramas. Their rivalry with the *Confrères de la Passion* was not dissimilar, if we make all due allowance, from the rivalry between the company of Molière, more than a century later, and the cultivators of the severer style at the Hôtel de Bourgogne. Like the latter, the old *confrérie* at the *Hôpital de la Trinité* began to find the public slipping away from them, and sought to bring them back by condescending to buffoonery and burlesque. But they ended by coalescing with the *Enfants Sans-Souci*. Amongst their most distinguished members was Clément Marot, whose favor with the king rescued his company from imminent suppression in 1512.

One of the favorite pieces in the répertoire of these companies was the *Farce de Cuvier*, which displays a very quaint and characteristic French humor. Jaquinot is a henpecked husband, whose round of household duties is never completed, and rarely ever attempted to the satisfaction of the exacting housewife. By some mishap she tumbles into the copper while he is helping her wash the linen. He will not help extricate her until he extracts a promise from her to give him his due share of authority. Releasing her he says, "From henceforth, then, I shall be master, for my wife allows it."

Amongst the favorite mysteries and other religious dramas of the fourteenth and fifteenth centuries were many in which profane history had not unfrequently its share of the dramatist's attention, as *Robert le Diable, la Nonne enlevée, le Baptême de Clovis, la Marquise de Gaudine, le Voyage de Saint Louis en Terre Sainte*.

The mysteries, in fact, began to go tolerably far afield for their subjects; to the Crusades, for instance, and to more recent French history. Thus, between the years 1429 and 1470 we read of the representation of the *Mystère du Siége d'Orléans*, in which, of course, Jeanne d'Arc occupies the place of the saint whose miraculous career is commemorated. With this wider latitude of subject came, naturally, a wider variety amongst the actors. The histrionic art was no longer confined to ecclesiastics and to citizens endowed with a certain amount of leisure, cultivation, and wealth. The artisans of the large towns took to following the stage as a means of increasing their incomes. A corporation or *Confrérie de la Passion*, as it was called, was formed which soon laid by money, bought land, and built a theatre.

The church shortly interfered and Parliament gave them authority only for "lawful, profane, and proper subjects," and expressly excluding the representation of sacred mysteries. It was a blow from which the confrérie never recovered.

After Bodel comes Adam de la Hall with his *Jeu de la Feuillie*. Adam is his own hero; his domestic troubles are the theme of his comedy. He comes in dressed in priestly garb, and says to his audience: "My Lords, should you like to know why I have changed my coat? I have been living with a wife; now I return to the clergy." He satirises his fellow-townsmen, carping at their love of gambling, at their gluttony and license, at the frailty of their women, even at the decrees of the Pope—being by no means

the first or the last public censor created by private wrongs.

A pastoral drama by the same author, and produced in the same place, *Robin et Marion*, was very popular in the thirteenth and fourteenth centuries. It grew out of an old song with the burden "Robin loves me, I am Robin's," which Marion is singing when the scene opens. His conceptions are eminently clever, his satire is bitter but trenchant and witty, and he was among the first to teach his countrymen the terrible power of that two-edged sword which is perhaps their most formidable weapon.

The dramas of this age were not always in the nature of comedies or burlesques of Scripture narrative. The Passion-Play was regularly acted almost year by year. At Valenciennes we hear of it being protracted over five-and-twenty days. At Angiers it occupied nearly a week, after being introduced by the *Veni Creator*.

The Miracle Plays.

Such was the religious drama as it gained form and completeness; and it was not long before its authors went for their subjects beyond the limits of Scripture. The Bible-plays soon gave place to, or rather were recruited by, miracle-plays; and the thirteenth century furnishes at least two of these which are still extant — the *Miracle de Théophile*, by Rutebeuf, and the *Jeu de Saint Nicolas*, by Jean Bodel. The former appears to have been founded on a Latin narrative, recording the apostasy and recantation of Theophilus, *vidame* of the church of Adana. Theophilus has been dismissed from his office; he rails at his misfortune, and ends by railing at God. The devil promises to redeem his fortunes at the price of his soul; and, the compact being made, bids him be of good cheer.

However, Theophilus does not reap his reward from Satan; he is restored by the bishop to his former office. Then he repents, and invokes Mary in prayer.

He obtains from her the annulment of the infernal compact, apparently without the resignation of his benefice; for all the world like the real-life repentance of the nineteenth century.

The play of *St. Nicholas* is by several degrees more profane in its treatment than Rutebeuf's drama, and, as it is by no means certain that it was ever acted in the church porch, we may now be in the presence of the first liberation of the Middle Age drama from ecclesiastical tutelage. Jean Bodel was a trouvère living at Arras whose latter life was the acme of human misery, for he died a leper. His work is even less original than the *Miracle de Théophile*. It is based upon a *ludus* of the monk Hilarius, also about St. Nicolas Aloomers in tavern scenes.

One play remains to be noticed, worthy the name of a comedy, which was produced about the close of the fifteenth century; the *Farce de Pathelin*, attributed variously to Villon, Antoine de la Salle, and Pierre Blanchet, and most probably the work of the latter. It is full of genuine humor. An advocate makes a client play successfully the idiot before the judge, and when pay is demanded by the advocate from the client, the latter continues his idiocy and comes off victorious.

The Three Last Trouvères.

Before emerging from the Middle Ages we are arrested by three poets, different in style and character, the last of the race of trouvères.

The first one, Charles of Orléans, was the son of the murdered Louis, Duke of Orleans, and of Valentine of Milan. He was taken prisoner by the English at the battle of Agincourt, and remained a captive in England for a period of twenty-five years.

During his long sojourn in a foreign land he wrote many poems, in different languages, and sang chiefly about the beauties of nature and of love with infinite and artless grace, though he is marred not seldom by excess of allegory. His songs reflect the mind of a poet, but not the history of his times.

The second was a royal trouvère, Rene, Duke of Anjou, Lorraine, and Bar, Count of Province and Piémont, King of Naples, Sicily, Jerusalem, etc. Like his cousin Charles of Orléans he also was for many years a prisoner; like him, too, he sang chiefly of the pleasures of love and the beauties of nature. His works bear the impress of a certain true admiration for the beauties of nature, and a peculiar artlessness of style, not without its charm. In *Regnault et Jehanneton* we have the best example of his descriptive powers.

The last and greatest of the trio is François Villon. His poems are sermons in *déshabillé*, moralities in the garb of looseness, history in romance, philosophy in love-songs. His strength and his weakness are precisely the strength and weakness of much of the French light literature of the present day. No one excels him in startling directness of phrase, in simple but infinite pathos of expression.

His works embrace the *Petit Testament* and the *Grand Testament*, in which about a score of minor pieces, chiefly ballades or rondeaux, are inserted: of a *Codicil* composed mainly of ballades; of a few separate pieces, and of some ballades in *argot*, collectively called *Le Jargon*. Besides these there are doubtful pieces, including a curious work called *Les Repues Franches*, which describes in octaves like those of the Testaments the swindling tricks of Villon and his companions.

Miscellaneous Prose.

The custom of preaching in France (or at least in *lingua romana*) began at a very early date. It is not, however, till many centuries after the date of Mummolinus that there is any trace of regularly written vernacular discourses. Maurice de Sully, who presided over the See of Paris from 1160 to 1195, has left a considerable number of sermons which exist in manuscripts of very different dialects.

The number of preachers whose vernacular work has been preserved is very large, and distinguished names indeed occur in the catalogue of preachers. but, until we come to the extreme verge of the mediæval period proper, there is hardly one which may be called of the first importance. Gerson, 1363–1429, is one of the most eloquent and instructive of them.

The most popular, perhaps, and in a way the most interesting of all the moral and devotional treatises of this period, is the book of the Chevalier de la Tour Landry, written in the third quarter of the fourteenth century, which is in short a "Whole Duty of Girls."

Translations of the Bible are among the earliest of all, especially of the Psalms and the book of Kings, the former of which may perhaps date from the end of the eleventh century. Translations of the fathers, and of the Lives of the Saints, followed in such numbers that, in 1199, Pope Innocent III. blamed their indiscriminate use. The translation of profane literature hardly begins much before the thirteenth century. Three translators, Pierre Bersuire, Nicholas Oresme, and Raoul de Presles, have left special reputations. All these writers furnished an enlarged vocabulary to their successors, the most remarkable of whom were Christine de Pisan and Alain Chartier. The latter is especially noteworthy as a prose writer as well as a poet. His *Quadriloge Invectif* and *Curial*, both satirical or, at least, polemical works, are his chief productions in this kind. Raoul de Presles also composed a polemical work on papal and royal powers under the title of *Songe du Verger*.

In law England and Normandy furnish an important contingent, the 'Laws of William the Conqueror' and the *Coutumier de Normandie* being the most remarkable; but the most interesting document of this kind is perhaps the famous *Assises de Jérusalem*, arranged by Godfrey of Bouillon and his crusaders as the code of the kingdom of Jerusalem in 1090, and known also as the *Lettres du Sépulcre*, from the place of their custody. These with the *Assises des Bourgeois*, which survives in *Le Livre de la Cour des Bourgeois*, contain the most complete account of feudel jurisprudence in its palmy days that is known

The chief remaining works of the same kind which deserve mention are the *Etablissements de St. Louis* and the *Livre de Justice et de Plet*, which both date from the time of Louis himself; the *Conseil*, a treatise on law by Pierre de Fontaines, who died in 1289, and the *Coutumes du Beauvoisis* of Philippe de Beaumanoir, who wrote in 1283. The legal literature of the fourteenth century is abundant, but possesses considerably less interest.

In prose fiction we have a *Ménagier de Paris*, a *Viandier de Paris*, both of the fourteenth century. But much earlier the orderly and symmetrical spirit which has always distinguished the French makes itself apparent in literature. The *Livre des Métiers de Paris* of Etienne Boileau, dating from the thirteenth century, gives a complete idea of the organization of guilds and trades at that time.

The *Trésors*, or compendious encyclopædias, in verse, began in the thirteenth century to be composed in prose, the most remarkable being that of Brunetto Latini, the master of Dante, who avowedly used French as his vehicle of composition.

Medicine and alchemy, astronomy and poetry, war and chess, had their treatises also, while Bestiaries and Lapidaries are almost as numerous in prose as in verse. Finally, there is the important category of books of travel. There are a certain number of voyages to the Holy Land, such as the *Saint Voyage de Jérusalem* of the Seigneur d'Anglure (1385), edited by MM. Bonnardat and Longnon, Paris, 1878, some miscellaneous travels mostly, though not universally, translated from the Latin; and last, but not least, the great book of Marco Polo.

In French prose fiction we have the early Arthurian romances already noticed, the scattered tales of the thirteenth and fourteenth centuries found in the *Bibliothèque Elzéverienne*, the legends of the *History of the Seven Wise Men*, and the *Gesta Romanorum*. When prose was becoming an independent and coequal literary exponent we have as specimens the editions of the *Roman des Sept Sages*, by Mr. Gaston, Paris, 1876, and the *Violier des Histoires* Romaines, by Mr. Gustave Brunet, Paris, 1858, and the *Roman de Jules César* of Jean de Tuim. Then comes the great romance of *Perceforest*.

They consist of *Asseneth*, a graceful legend of the marriage of Joseph with the daughter of the Egyptian high-priest; *Troilus*, interesting chiefly as a prose version of Benoist de Ste. More's legend of *Troilus and Cressida*, through the channel of Guido Colonna and Boccaccio; and a very curious English story, that of the rebel Fulk Fitzwarine. The thirteenth-century tales consist of *L'Empereur Constant*, the story with which Mr. Morris has made English readers familiar under the title of the 'Man born to be king'; of a prose version of the ubiquitous legend of *Amis et Amiles;* of *Le roi Flore et la Belle Jehanne*, a kind of version of *Griselda*, though the particular trial and exhibition of fidelity is quite different; of the *Comlesse de Ponthicu*, the least interesting of all; and lastly, of the finest prose tale of the French middle ages, *Aucassin et Nicolette*. In this exquisite story Aucassin, the son of the count of Beaucaire, falls in love with Nicolette, a captive damsel. It is very short, and is written in mingled verse and prose. The theme is for the most part nothing but the desperate love of Aucassin.

Antoine de la Salle, born 1398, has given us the charming romance of *Petit Jean de Saintré*, his only acknowledged work.

To this have been added the admirable satire of the *Quinze Joyes du Mariage*, then the famous collection of the *Cent Nouvelles*, and last the still more famous farce of *Pathelin*. There are for once few or no external reasons why these various attributions should not be admitted, while there are many internal ones why they should.

Petit Jehan de Saintré is, together with the *Chronique de Messire Jacques de Lalaing* of Georges Chastellain (a delightful biography, which is not a work of fiction), the handbook of the last days of chivalry. Strikingly evident in the book is the surest of all signs of a dying stage of society, the most delicate observation and sympathetic description joined to sarcastic and ironical criticism.

The Renaissance.

The manifold energy of the Renaissance (See Renaissance) manifested itself in all its militant vigor and intensity during the sixteenth century. By its resort to the models of antiquity, by its keen-edge and polished satire, by its rehabilitation of philosophy and jurisprudence, by its spirit of scepticism, by its reformation of religion, at least attempted from within the Church, this crisis of intellectual thought in France gave evidence of all the highest faculties and capabilities of the national mind. From regenerate Italy a new Roman Conquest was brought into Modern Gaul.

As Montaigne and Ronsard and Pascal were destined to have their schools of imitation and disciples, so were Petrarch and Boccaccio, the Medici and the Borgias, Lascaris, Leonardo da Vinci, Poggi, Bembo, Politian, amongst the first leaders of the resuscitated intellect of France. For the revolt against the darkness of the Middle Ages began on classical soil; antiquity was renewed in the home of its original glory.

The art of printing had not been slow in bringing ancient literary documents within the reach of almost every studious man. It was in 1474 that William Caxton printed his first book. Before the end of that century the Venetian Aldi had produced an edition of Aristotle in Greek. Demosthenes, Plutarch, Livy, Cicero, Tacitus, followed in rapid succession. After the text came the commentaries. Rival printers ransacked the manuscripts of every age to discover fit subjects wherewith to appeal to an anxious public.

France had her Medici, her Elizabeth, her guardian and nourisher of learning, in the early days of Francis the First. (See Francis I, 1494–1547.) He was a strange anomaly, whom literature can neither love nor despise; and yet a strangely apposite picture of the century which he ushered in, full of contrasts and contradictions, of chaotic discord and of splendid illumination. He founded the Collége de France, establishing chairs of Greek, Latin, and Hebrew; he emulated Charlemagne by inviting learned foreigners to his court; he encouraged art, and went so far in the liberal path, condemned and hated by the ecclesiastics, as to direct Clément Marot to edit the poems of Villon.

Budaeus and his Fellow-Workers.

Amongst the distinguished men who shed lustre on the court of Francis the First was Budaeus (Guillaume Budé), 1467–1540, the most industrious and noted classical scholar of his age. It was to a great extent by his advice that Francis the First determined on founding the Collége de France—originally styled the *Collége des Trois Langues*.

Budé's own literary labours were confined to learned exegesis and commentaries. He wrote annotations on the Pandects, applying the acuteness of a philologist and the judgment of an historian to the elucidation of Roman law; a treatise *De Asse*, upon the varying value of Roman money in successive ages; and an inestimable contribution to Greek etymological knowledge, the work of a genuine grammarian, his Commentaries on the Greek language. He does not seem to have ever fully mastered the difficulties of French style; or, at least, he has left us nothing of importance written in French. Budé's influence upon French literature was an indirect one, acting through the minds of those who, receiving a learned education in their youth, passed by natural preference to the more popular domains of literary activity.

The fellow-workers and immediate successors of Budé in the cultivation of the classical tongues were many. At the Collége de France we find Vatable, Danès, Toussain, Turnèbe, Lambin; the latter so notoriously circumspect in the work which he undertook, that he has enriched the vocabulary of his native tongue by the hardly-merited prostitution of his name *Lambiner* to dawdle. Better known even than these were Robert and Henri Estienne, the father and son,

the first a printer of the Holy Scriptures, who, his orthodoxy being suspected, thought it prudent to end his days in Geneva; the latter, author of perhaps the grandest monument of sixteenth century scholarship, and a pamphleteer in French of no mean order. Henri Estienne was as ardent a politician as he was a laborious scholar, and, if a polished Latinist, yet before all things a Frenchman. Estienne wrote his *Deux dialogues du nouveau Français italianisê*, a bitter, unstinting, terrible satire which brought upon him the wrath of the ecclesiastical Consistory of Geneva, and drove him into exile. Across the frontiers of Switzerland, his bitterest work was *Le Second Enfer*, directed against the abuses of legal administration. He was several times accused of heresy, and became at last involved in a dispute about the merits of Cicero, in which he certainly showed great powers of sarcasm.

The faculty of Theology of Paris found that he had badly translated a certain passage of the Greek philosopher, declared him an *athée relaps*, and burned him on the Place Maubert in the capitol, together with his books, after having tortured him with great cruelty. Thus perished a young man of thirty-seven years of age, who suffered for that madness of learning, that enthusiasm for the light, which possessed so many of his contemporaries; who paid with his life for having flayed with cutting satire the champions of ignorance and darkness; for having doubts raised as to his orthodoxy. In the death-song of this brave and noble soul, the Renaissance had already set its seal upon the century.

Satire in the Renaissance.

The Middle Ages had their satire, as we have already found, but it was as nothing to the torrent of raillery, invective, trenchant irony, biting malice, of the sixteenth century. Men vindicated the rights of thought with the arms of thought; they crushed the wielders of many legions with a word. Satire was the blade in which they trusted, and their trust was not misplaced. Their judges send them to the stake and the wheel, hang them, draw and quarter them. They sing a song on their way to the shambles which makes their judges tremble; for a nation which knows how to use satire knows also how to feel it. The sister of Francis the First led the way, Marguerite, the well-known Queen of Navarre (1492–1549). In the *Heptaméron* she vents her contemptuous scorn upon husbands, though she was not unmarried; against monks, though she was an ardent devotee of religion; against lawyers and doctors, though she was a queen. And her shrewdest satire of all is unconsciously pointed against herself, for she stands revealed to us as a very woman, the rivals for whose favor are God and the Devil, and who affords to neither of these more than a short and coquettish glance. Her own gentleman-in-waiting, Bonaventure Desperriers (died about 1544), the intimate of Marot, was a free-lance after her own heart, light in love and faith, who began by playing soft nothings to his mistress on the lute, and ended by publishing his *Cymbalum Mundi*—a somewhat vague and incomprehensible prose work, and yet a firebrand amongst his enemies. Desperriers was not exempt from the fate of so many of his contemporaries who were made martyrs to the emancipation of human thought. He was hunted to death; and, it is said, took his own life in a fit of despair and despondency.

Clément Marot (1495–1544), *valet de chambre* of Francis the First, was a satirist of a trenchant character; he, too, paid with his life the penalty of his liberty, dying a miserable and persecuted exile. In his life, his character, his genius, he is a type of the age in which he lived. At once a pedant and a vagabond, a scholar and a merry-andrew, a man of letters and an *enfant sans souci*, ennobled by education and degraded by the very intoxication of knowledge, unable to preserve his balance under the burden of a thousand new ideas, now adding lustre to learning, now trailing the dignity of authorship in the mire. His poems are as varied as were his personal moods. He edited Villon and modernised Jean de Meung; he versified two *Colloquia* of Erasmus and the parable of the Good Shepherd; he translated the *Penitential Psalms* and Ovid's *Metamorphoses;* he wrote the praises of Saint Christina and sang the triumphs of Cupid; he composed innumerable rondeaux, ballads, songs, epigrams, epistles in verse.

On account of his satires he was obliged to flee to Ferrara.

It was during his exile that he wrote to Lyon Jamet his *Treis Epîtres du Coq-à l'Ane;* nonsense verses of a peculiar light and pliable kind—*vers de société*, in which Marot excelled, and which were specially adapted for the conveyance of satirical allusions. His *Temple Cupidique* reminds us more than once of the English poet Chaucer, and its first lines would seem to be a close copy of the opening of the "Canterbury Tales."

Rabelais.

We have now come to Rabelais (1483–1553), the greatest satirist of the age, perhaps the greatest satirist of France, whose death occurred midway in the sixteenth century, and around whom all the lesser satirists revolve in ever-widening orbits. A monk to begin with, a voracious scholar and indefatigable thinker, who, probably about 1523, had been rescued by Budé from the punishment attending his persistent and illicit study of Greek, his fame rests not upon ecclesiastical labours or classical scholarship, but upon the rough coarse humor and unmerciful satire of a couple of works in which he lashed his age and his profession. He lived scarcely long enough after the appearance of the last part of *Pantagruel* to experience the persecutions which had fallen so heavily upon the heads of his contemporaries; and, moreover, he was not a man to court reproof and repression, like Marot. Let it be well understood, Rabelais was in his writings a buffoon, a licentious jester, despising and outraging the proprieties, railing at religion and mocking at decency, coarse though never prurient; but in his private life he was—there is at least nothing to the contrary—a respectable and outwardly moral man, a consistent Catholic, who preserved the respect of his superiors. Entering the monastic life as a Franciscan, he transferred his allegiance under a bull of Pope Clement VII. to the Benedictines. Dissatisfied with his vocation, he took a degree in medicine, and apparently practised for some time as a physician; then, reverting to his first choice, he was restored by Paul III. to the order of St. Benedict. Once more wearying of the cowl, he obtained the vicarage of Meudon, near Paris, and occupied it until his death.

The characteristic virtues and vices of the Renaissance are conspicuous throughout the works of Rabelais. The intoxication of the newly-revived classical learning, the moral revolution in the Church, the outburst of free thought, free speech, free action, the overcrowding of new ideas; and the dazzling splendor of new facts, all are present in the writings of this genial monk.

The satire of *Gargantua* and *Pantagruel* was, as we have seen, twofold in its character, representing the twofold cause of the French national spirit in the pursuit of its vocation.

Imitators of Rabelais arose among which are the names of men like Noel du Faïl (died about 1585), an eager relater of old Greek, Italian, and French stories of the broader kind, with little spirit save in the appreciation of his originals; Béroalde de Verville (1558–1612), whose *Moyen de Parvenir* has more of the salt of genuine satire, so much so as to earn for him great praise of competent critics; and a host of lesser lights, all of whom shine with more or less distinct reflection of the great luminary of their age. Rabelais was the best-endowed child of the early Renaissance, he was the ablest and most influential teacher of his age, because he was the grandest product of that revived spirit of French satirical philosophy which had already given to the world the author of *Pathelin*, and which was yet to evolve the author of *Tartuffe*.

Montaigne and the Moralists.

In Montaigne we can perceive the influence of, or, at the very least a natural succession to Rabelais, illustrated by the higher, more delicate and refined mood of satire, yet at the same time Montaigne was himself the leader of a school, and has left a deep imprint upon the literary fashion of his age. He was a moralist *par excellence*, a metaphysician, who, in style and tone, was the progenitor of Charron, of Vauvenargues, of La Bruyère, of La Rochefoucauld. His reflection, his taste, his critical instinct, his *incuriosité*, in his celebrated *essais*, to use a word of his own, and his eclecticism, are conspicuous in every one of his discourses, as they are conspicuous in his disciples. The loftiness, the dynamic power of his morality, cannot surely be said to suffer by the impassioned outbursts which mark the contact of this unconscious preacher's mind with the meanness, the crimes, the miseries of humanity. In the fervour of his declamations he gives us, here and there, a foreshadow of the theoretical socialism of our own day — an antetype of the dignified radicalism of one of his greatest eulogists, Rosseau. In religion, it is manifest, Montaigne was a Conservative; and yet he was in fact the prince of sceptics. His chapter on prayers is couched in language of reverent simplicity; though he tells us that the Lord's Prayer is the only one which he retains in his memory. Montaigne was before all things a literary *flâneur*; a gossip and not a teacher; superficial rather than profound. A deep thinker he hardly deserves to be called; for his shrewdness of expression was more a natural turn of thought than an acquisition.

Montaigne's Friends and Disciples.

Amongst the intimate friends and disciples of Montaigne, whose companionship brought him the consolation of a literary sympathy, and to one at least of whom he left the legacy of his ardent and well-poised spirit, where La Boëtie (1530–1563), Charron, and several other scholars and philosophers, indefatigable explorers of the past and eager anticipators of the future. Already at a youthful age La Boëtie was one of the councillors of the Parliament of Bordeaux, became there acquainted with Montaigne, and wrote translations of Aristotle, Plutarch, and Xenophon. But his fame rests chiefly on his vivid and eloquent pamphlet *De la Servitude Volontaire*, written in 1546, which circulated for about thirty years in manuscript, without author's name, without title, and without date, and to which the public had given the epigrammatic name *Le Contr'un*.

There is no mention of Charron (1541–1603) in the *Essays;* and he does not seem to have made Montaigne's acquaintance until the year 1589, three years before the master's death.

A French critic, A. Desjardin, has not much overstated the case in saying that "there are not many books so devoid of originality as the *Traité de la Sagesse*." The method, the text, the style, the very illustrations and quotations, are Montaigne's; and when Montaigne fails him, he has recourse to Montaigne's library, taking the gist of whole chapters at a time from Seneca, Plutarch, Justus, Lipsius, Bodin, or Du Vair.

Amongst the moralists of the sixteenth century, whereof Montaigne formed the centre and the type, we may reasonably include De Pibrac, who, predeceased the author of the *Essays*. Next to Montaigne himself, perhaps Pibrac had the most wholesome influence on his generation.

Contemporary Lawyers.

Etienne Pasquier, an advocate, was a Parisian, born in 1529, before the death of Erasmus, before the birth of Montaigne, before Rabelais had written his *Gargantua*, and his life extended over fifteen years of the subsequent century. He died five years after the massacre of Henri IV., after the death of Desportes, Regnier, and Charron. As a man of letters, a critic, and a connoisseur, he took part in the intense literary activity of his age. Amongst his remains are a large number of *Letters*, addressed to his sons and the more intimate of his friends, which amply attest the catholicity of his taste and judgment. The most ambitious of his literary efforts was a volume of *Recherches de la France*, in nine books, a work insufficient, indeed, to earn for its author high rank as a historian, yet very readable. A volume of *Notes and Queries*, another of the *Curiosities of Literature*, a dozen chapters of Selden's *Table-Talk* and Southey's *Commonplace Book*, would not ill represent this heterogeneous, discursive, anecdotical book. He was unquestionably the purest writer of French prose in the sixteenth century, and his influence upon the language was hardly inferior to that of Malherbe. As a juris-consult he was formed upon his master, Cujas (1522–1590) of Toulouse, a pupil of the celebrated Italian lawyer Andrea Alciati (1492–1550), through whom another channel of influence had been opened between Italy and France. The latter had settled in Bourges, on the invitation of Francis the First; and within a few years he had gathered round him a school of Roman law whose studies were directed upon entirely novel principles and methods, and which substituted in France a new science of jurisprudence for the time worn traditions of the past fifteen centuries. Cujas himself laboured all his life to classify and explain the fruits of Roman legislation after a scheme never hitherto applied to them. No longer satisfied with the positive code, which, from the time of Justinian — not to go farther back — had been accepted as it stood, without reference to the sources of its inspiration, he brought to bear upon it all the light of history, antiquity, scholarship, and scientific research. Every individual law was studied afresh, in connection with the epoch and the special circumstances of its first promulgation. What Cujas did at Toulouse, and for Roman law, Dumoulin (1500–1566) did at Paris for the civil law. These were succeeded in their labours by that famous group of French magistrates who have shed lustre on the sixteenth and seventeenth centuries, among whom were Henri de Mesmes (1531–1596), a lawyer and a statesman, and Loisel (1536–1617).

Loisel was a Parliamentary advocate, who divided his mind between the study of the law and the cultivation of classical literature. He has left us a monument of his friend Pasquier in a dialogue which takes the name of the latter for its title, and which is copied from the model of Cicero's *Brutus*.

Nicholas Pasquier (born about 1560), the second son of Etienne Pasquier, "maître des requêtes," in the French courts, has left behind him, in addition to his *Letters*, a treatise on the education of the young, under the title of *Le Gentilhomme*. This work exhibits much of the elegance and sustained loftiness of the noble style on which it was modeled, but it is in his *Letters* that we must look for the intellectual measure of Nicholas Pasquier — and, as a consequence, of his time.

Others of the same brilliant group of magistrates, the fruits of whose scant leisure prove how much literature might have gained at their hands in happier times, were Robert Garnier, a dramatist, of whom we shall have further occasion to speak; Vauquelin de la Fresnaye (1556–1607), a poet and satirist, to whom Boileau was indebted for part of his inspiration; Du Vair (1536–1621), author of a *Traité de l'Eloquence française;* Michel de l'Hôpital, who deserved, as much as any of his contemporaries, the praise which Montaigne bestowed upon the cultivated public men of the sixteenth century; and Pierre la Ramée (1515–1572), or, as he preferred to latinise his name, Ramus. It was beneath the strokes of his trenchant blade, in particular, that the mouldering scholastic philosophy crumbled into ruins. He was a professor of eloquence and philosophy, and during his whole life a martyr to his attempts at reformation. He wrote a great many works, which were all eagerly read in his time, became a reformer of spelling, was considered not alone one of the best classical scholars, but also the first mathematician of his time. He even founded a chair of mathematics at the *Collége Royal*, was one of the

first adherents of the system of Copernicus, became a Protestant, and was finally murdered on St. Bartholomew's night.

Jacques Amyot (1530–1594) followed the steps of Ramus, and translated Plutarch. Under his hands the stilted yet philosophic style of the great historian assumed a modern form, at once graceful, philosophic, and effective. Bodin (1530–1596) was amongst the most philosophical of those classical magistrates whose strength was rather in language than in philosophy. His own principal work, *Six Livres de la République*, belonged to that class, sufficiently numerous in every literature, which deals with the theory of government. He takes for his guide in his definition of the laws of government, not simply the character of those who are to be governed, but the experience of rulers and subjects. His works are full of proofs of his penetration, judgment, and philosophical breadth.

The Reformation.

Possibly the most significant outcome of the Renaissance, and certainly the most powerful development of the intellectual revolution which distinguishes the sixteenth century, was the reformation of religion. The characteristic of the age was rebellion — rebellion of the spirit of man against the forms and grooves in which it had been endeavored to cramp it — rebellion of the intellect against the formulas of tradition and the authority of mere didactic knowledge — rebellion of the soul against the conventional teachings and interpretations of a church distinguished more by tyranny and persecution than by intelligence and morality. The leaven of this latter revolt had indeed been working for many centuries in every country of Christendom, and in none more so than in France.

Calvin and His Friends.

Throughout the earlier stages of the religious struggle going on in France at that time, Calvin, from his retirement at Geneva, had exercised a powerful personal influence, exciting the people by his writings, by his frequent letters, by his emissaries, by organisation. Rabelais called his contemporary "le démoniaque de Gèneve."

Calvin has been considered by some critics as "cold, morose, stern, implacable, using his power of raillery with the same ruthless and unrelenting animosity with which he employed every other weapon wherewith he could injure his foes. Satire without a smile is perhaps the nearest approach to outward feeling which we find recorded of the hypochondriac reformer of Geneva." This is overdrawn language.

The son of a procureur-fiscal, he was destined for the church; was at twelve years a chaplain; was one of the best classical scholars then known, and even not unacquainted with Hebrew.

His *Christian Institution*, written when he was but twenty-six years of age, was the first French work of importance which prominently displayed the severe logical reasoning, well sustained and clearly enunciated, which has ever since distinguished the national French literature. What Villehardouin and Joinville did for history, Calvin did for theology; and more, for he not only showed his countrymen how to treat the most elevated of all themes, but he gave them at the outset a masterpiece and a model.

In the dedication of this great work was the dignity of faith, asserting and magnifying itself before the dignity of royalty: an assertion couched in terms of almost abject humility, and yet flaming with the covert satire of a literary giant. Here, too, was a force and concision of language never before heard in France; a style vigorous by its very simplicity and sobriety, which was the genuine outcome of the Renaissance, owing the least part of its strength to the classical models, and yet in itself classical and a model to all who came after. The influence of Calvin's writings upon the style of his successors, and upon the literary development of his country, cannot easily be overestimated. With him French prose may be said to have attained its manhood; the best of his contemporaries, and of those who had preceded him, did but use as a staff or as a toy that which he employed as a burning sword..

Theodore de Beza (1519–1605), who was a friend and disciple of Calvin, was ten years his junior. His earliest work was a volume of Latin poetry, *Juvenilia*, distinguished rather by delicacy than by morality. He appears to have been one of those who were won over by the eloquence of his master not only from the vanities of the world, but from the ranks of the Romanists.

He was the historian of the Reformation in France, having left behind him a *Histoire Ecclésiastique des Eglises Réformées au Royaume de France.*

Purely classical in his own style, he used his talents chiefly to spread the religious principles in which he believed. He wrote, amongst other works, a religious tragedy, *Le Sacrifice d' Abraham*, after the Greek models, which remains as a proof of his correct classical taste. It is somewhat in the style of Milton's *Samson Agonistes.*

Farel (1489–1565) and Viret (1511–1571) have also to be classed among the literary reformers; but whatever may have been their influence in the field of theology, they made no mark in that of literature.

From the Classical Renaissance Until the End of the Reign of Louis XIV.

The preachers of the League were men of eloquence and religious ferocity. Jean Boucher, Rose, Bishop of Senlis, Canon Launay, who had been a Protestant himself, Prévôt, Pelletier, Guincestre, Hamilton, Cueilly, were amongst the first and the most famous of a numerous company of orators who have become known under the name of *Prédicateurs de la Ligue.*

Of all the preachers of the League, Boucher was the most eloquent and the most pugnacious. A pedant with a turn for fighting, he alternately wrote learned diatribes in Latin, and egged on the populace to revolt against the constituted State authorities.

Amongst the famous Sixteen who opposed the accession of Henry of Navarre in Paris was Louis d'Orléans, a learned advocate, who produced an ephemeral pamphlet under the title *A Warning to French Catholics from an English Catholic.*

The *Commentaries* of Blaise de Montluc were recognised by Henry IV. as "the soldier's Bible."

The principal work against the League was the famous *Satire Ménippée;* and indeed one of the most formidable literary documents ever given to the world. The *Ménippée*, prose and verse, was due to the working of a new Pléiade—Leroy, Gillot, Passerat, Rapin, Chrestien, Pithou and Durant. Most of them were lawyers, a few were more or less connected with the church.

It has the form of a travesty of the assembly of the States at Paris.

The actual procession, of which the first part of this description is a parody, took place in 1590.

Seven supposed solemn speeches are then delivered by the Duke de Mayenne as lieutenant, by the legate, by the Cardinal de Pelvé, by the Bishop of Lyons, by Rose, the fanatical rector of the University, by the Sieur de Rieux, as representative of the nobility; and, lastly, by a certain Monsieur d'Aubray, for the *Tiers-Etat.*

All the mean political rivalries which pretend to work only for the public good are exposed there; all these men, who take God as a shield to hide their own personal baseness, pass before us.

Butler (who beyond all doubt had the *Satyre Ménippée* in his mind when he projected his own immortal travesty of the Puritan party) is the only writer who has ever come near to its authors in this particular department of satire.

The *Satyre Ménippée* had an immense effect, and may, perhaps, be justly described as the first example, in modern politics, of a literary work the effect of which was really great and lasting.

It has been said, with a certain licence of hyperbole, that it was worth as much to Henry IV. as the battle of Ivry.

The Didactic School of Poetry.

Joachim du Bellay was one of the chief characters of the Pléiade, or the *Brigade*, as the literary men of this period began by calling themselves.

Du Bellay wrote the *Défense et Illustration*, also the *Olive*, a collection of a hundred and fifteen sonnets, a few odes, and several poems in the Alexandrine measure. He brought the latter to great perfection, and his *Hymn on Deafness*, and *The Poet Courtier* bear witness to it.

Spenser was a great admirer of Du Bellay; he translated his *Antiquités de Rome* under the title of *The Ruins of Rome*.

Ronsard, a native of Vendôme, is confessedly the greatest of the poets of the Pléiade.

Les quatre premiers livres des Odes de P. de Ronsard, Vandomois; ensemble son Bocage was the title of his first work, which was given to the public in 1550.

The first four books of Ronsard's Odes were quickly followed by the fifth, which was published in 1552, together with his *Amours*. From that moment he was accepted as the great poet of the day. He was hailed as the Pindar, the Horace, the Petrarch of France. Montaigne himself declared that French poetry had attained its standard, and could not advance beyond Ronsard. In a sense, he was right. Until the nineteenth century, perhaps, it never did.

It was natural that Ronsard should have many imitators, both during his lifetime and in the age immediately succeeding his death; and these not always servile in their imitation, but men of more or less capacity and inventive talent.

One of the best of them was du Bartas (1544–1590), a native of Auch, in Gascony, who exaggerated all the most pedantic qualities of his model, and wrote, amongst other works, a poem which deserves to be called the phrase-book of the neo-classical school. This was the *Semaine, ou Création du Monde*, the marriage-register of science and verse.

The Reform of the Language.

Malherbe (1555–1628) was in his thirtieth year when Ronsard died. He had already become known as an acute, if somewhat caustic and acrimonious, critic. He openly laughed at the Pléiade, and professed a supreme contempt for their stilted and pretentious works.

His fame as a poet rests on a thin volume of verses, of no great dignity or loftiness of aim; consisting, indeed, for the most part, of odes to the royal family, and to the more influential of the courtiers. One cannot but feel tempted to doubt the reality of Malherbe's influence on the language of his country, and to refuse him the post of honor which Frenchmen have assigned to him. Yet when we come to read his choicest morsels, to study and appreciate the secret of his charm and the subtlety of his beauty, we are obliged to confess that the French language contained nothing before him more genuinely polished and sublime.

Mathurin Regnier (1573–1613), a man of intellectual force and genius, not unworthy to be classed with Villon and Marot, personified the counter-reaction which set in against Malherbe's almost indiscriminate condemnation of the past.

Racan was a man who cultivated the Muses as an elegant occupation, and through a sincere and imitative admiration of his chosen guide and friend, Malherbe.

His best work was *Les Bergeries*, a sort of pastoral dialogue in which the poet vainly attempted to harmonise the classical severity to which he had been trained with the natural freedom which the choice of such a subject seemed to promise.

Racan's *Les Bergeries* was dedicated to Honoré d'Urfé (1568–1625). A prose-romancist rather than a poet, an adapter and dramatiser of Italian pastoral stories, d'Urfé was still imbued with much of the spirit of Malherbe, and was a genuine literary reformer, not merely of the language, but also of the tone and spirit of French literature. In particular, he rehabilitated and made once more popular the old chivalrous traditions of his country. His masterpiece, *l'Astrée*, the work by which he is known and remembered, was a romance first published in 1609, continued in 1616, further extended three years later, and completed from the posthumous papers of the author in 1627. It had a remarkable success.

With poets such as Malherbe, and prose writers such as Honoré d'Urfé, the French language had attained its majority; or rather it had added a crowning grace and elegance to the nervous strength with which Calvin had endowed it. The work of the Renaissance was complete.

The Theatre of the Renaissance.

No doubt it was to the Pléiade itself, say rather to the spirit evoked by, or at least embodied in, the appeal of Joachim du Bellay, that the inauguration of the classic drama in France was due. Lazare de Baïf (1490–1547) the father of the better known poet, Jean Antoine de Baïf (1582–1589), a natural son, was at the pains of literally translating the *Electra*, *Hecuba* and *Iphigenia*, whilst his son's great friend, Ronsard himself, translated the *Plutus* of Aristophanes. Etienne Jodelle was, however, the first of the school to compose plays for actual representation; and as he found no theatre nor actors ready to his hand, he obtained from Henry II. the use of the court-yard in the Hôtel de Reims, and played in his own pieces. In this he was assisted by his friends Remi Belleau, Jean de la Péruse and others; the king patronised and subsidised his theatre, and the success of his venture was assured.

His principal plays were *Cléopatre Captive* and *l'Eugene*. The latter is better than the former.

Of Jodelle's friends and fellow-laborers there is not much to be said. Jean de la Péruse (1530–1555), author of a classical medley which he called *Médée;* Jacques de la Taille (1542–1562), who wrote a *Daire* Charles Toutain, who attached his name to an *Agamemnon;* and Jean Antoine de Baïf, who translated Sophocles' *Antigone*, and Terence's *Eunuch*, and imitated Plautus' *Miles Gloriosus*, are nearly all forgotten. Jacques Grévin (1539–1570), a Calvinistic doctor, who died young, was greatly praised by Ronsard at first, but his name was afterwards erased from the master's writings on account of his Protestant opinions. He wrote several comedies, and a tragedy, *Jules César*, in which la Harpe found "grand and powerful ideas and the real tone of tragedy." Robert Garnier (1545–1601) was perhaps the only one who showed great inventive force, and in his tragedies, imitated from Seneca, Sophocles and Euripides, he displayed at least the art of keeping up a dialogue, though he is not seldom prolix, harsh and diffuse.

The Classical Drama.

On the whole, indeed, the classical drama revived by the Pléiade was virtually a failure; it never became widely popular, and scarcely found its way to an audience outside the circles of the Court, and the schools of fashion and of pedantry. But in the meantime, the taste for the old national drama was not dead in France; and it manifested itself over and over again — no doubt more frequently than existing records might lead us to believe — in spite of the veto of the Parliament. Travelling through the Provinces there were numerous companies of players, still clinging, in all probability, to the favorite dramas and farces of earlier days; and few of these companies were without a poet who could re-handle old materials, and, at a pinch, produce something which might pass for new. In 1584 a company bolder than the rest, ambitious of a wider fame and a more lucrative run, came up to the capital. But, however they might have hoped to evade the terms of the edict of 1548, they were prevented from acting by the effete old corporation of the *Confrères de la Passion*, whose charter had never been annulled, although it was no longer of any value. Sixteen years later another company managed to come to an understanding with the *Confrères*, paying them a royalty for each represen-

tation. They installed themselves at the Hôtel d'Argent, near the Grève, and thenceforth Paris had a theatre which might fairly be called popular. In 1629, seven years after the birth of Molière, in the very year of the foundation of the Academy, Louis XIII. gave his authorisation to the *Comédiens ordinaires du roi*, who established themselves in the Hôtel de Bourgogne. It was in this same year that Corneille produced his first play; the golden age of the French drama had begun.

Amongst the immediate predecessors of the famous author of the *Cid*, were Hardy (1606–1684) and Mayret (1604–1686). The first, whom a happy paradox has designated "a Shakespeare without the genius," whom Corneille honoured with unselfish praise, departed not a little from the senile classical fashion of the Pléiade, and has at least abundance of action and of characters. His muse is full of life and humour; his audiences were always large and well amused; but he is rather melodramatic than dramatic. Occasionally, as in *La Gigantomachie*, he descends to the most extravagant burlesque, ending in nothing short of a harlequinade. In *Ariadne* he gives us a pure tragedy in four protracted acts, and finishes the play with the marriage of Theseus and his victim. The best of his dramas, at all events, in style and composition, is *Panthée*, which is a tragedy to the last, original in its plot, and very fairly executed. His next best play *Mariamne*, is powerfully written, is arranged with considerable skill, and contains some fine lines and even scenes: but, little as Hardy hampered himself with rules, it still has, to an English reader, a certain thinness of interest.

His fertility was immense; and he is said to have written some hundreds of plays. The exact number is variously stated at from five to seven hundred. Forty-one exist in print.

As for Mayret, his *Sophonisbe* is a somewhat remarkable play, professedly shaped upon the model sketched out by Aristotle, and pressed upon the poet's acceptance by the pedantic Chapelain (1595–1674).

A contemporary of Hardy's and Mayret's, Jean de Schélandre, made, in a play which does not seem ever to have been acted, a remarkable attempt at enfranchising French tragedy with the full privileges rather of the English than of the Spanish drama; but this play, *Tyr et Sidon*, had no imitators and no influence.

Corneille.

Pierre Corneille, who is deservedly reckoned with Molière as the creator of French dramatic art, was born at Rouen in the seventh year of the seventeenth century; and he devoted himself at an early age wholly to the drama. It is true that he has left a few miscellaneous poems, and a translation in verse of the *Office of the Holy Virgin;* and for six years, from 1653, he renounced the stage, and produced a fine translation in verse of Thomas à Kempis's *Imitatio Christi*. His religious tendency was manifested throughout his life; but the best efforts of his literary genius were occupied in the composition of lofty tragedies in a style of great beauty and finish, interspersed now and then by comedies of considerable grace and vigor.

It is related of him that his first comedy, *Mélite*, was written under the inspiration of his first love, one Mademoiselle Milet, resident in Rouen.

Mélite was succeeded three years later by *Clitandre, or Innocence delivered*, in which the heroine Dorise snatches a hair-pin from her locks and pokes out with it the eye of Pymante, who addressed a long monologue to the murderous instrument. This *tragi-comédie* was followed in rapid succession by the *Widow*, which was very successful; by the *Gallery of the Palais; The Ladies'-Maid; The Place Royale; Medea*, a tragedy chiefly imitated from Seneca; the *Comic Illusion*, in which appeared for the first time the Matamore, an adaptation of the classical "Miles Gloriosus," and somewhat like Ben Jonson's Captain Bobadil; and finally, in 1636, the *Cid*. The first eight plays were merely tentatives; the *Cid* was a masterpiece; Corneille was indebted for the plot of the *Cid* to the work of a Spanish writer. *The youth of the Cid*, by Guilhen de Castro.

In 1639 Corneille produced his tragedy of *Horatius* —the original title, and not *The Horatii* — to prove that he had no need to imitate anyone.

Cinna, which appeared a few months after *Horace*, cast in a far severer mold than the *Cid*, is perhaps the best example which we could select of Corneille's classical dramas. The author himself thought it his finest.

Polyeucte, represented in 1640, is a Christian tragedy, full of pathetic tenderness and sublime thoughts.

In the two following years he produced *Pompey* and *The Liar*, a comedy, freely followed from the Spanish.

A *Sequel to the Liar*, also imitated from the Spanish, which was brought out a year later, met with little success, and deservedly so; but Corneille took his revenge with *Rodogune*, of which the fifth act struck terror in the heart of the spectators.

Then came *Théodore* (1645), another Christian tragedy, in which a young girl has to choose between being dishonored or becoming an apostate, and which was wholly unsuccessful. Two years later, he gave *Héraclius*, and was at last elected a member of the Academy, after having seen twice some insignificant literary man preferred to him. *Don Sancho of Aragon*, a heroic comedy; *Andromeda* and *Nicomedes*, followed in succession.

Then followed one another *Pertharito*, *Œdipus*, *The Golden Fleece; Sertorius*, in which the hero is well delineated; *Sophonisba; Otho*, in which Galba and Otho are energetically depicted after Tacitus; *Agesilaus; Attila; Titus* and *Berenice*, a subject which Racine also treated. *Psyche*, a comedy-ballet, in collaboration with Molière and Quinault; *Pulcheria;* and finally, after a dramatic career of forty-five years, and after having produced thirty-two plays, his last tragedy, *Surena* (1675).

Thomas Corneille (1625–1709), his brother, who was nineteen years younger than Pierre, was also a laborious dramatist, but is a proof that the old Latin saying, *Labor vincit omnia*, is not always true, for though he labored hard, he could not overcome his want of talent. He married the sister of his brother's wife, lived with his brother, and wrote the same number of dramatic pieces; yet only his *Count of Essex*, and perhaps the *Festin de Pierre* — which he versified after Molière's *Don Juan* — are known to posterity. He was an excellent brother, but not at all a first-rate dramatist.

We may here introduce a satirist of the later Renaissance. Théodore Agrippa d'Aubigne (1550–1630). He was the grandfather of Madame de Maintenon; the progenitor of a distinguished family, whereof Merle D'Aubigne, in the present century, was a worthy representative.

Nothing could be more savage than some of his brochures; the fiercest of all, if it is rightly attributed to him, is the *Divorce Satirique*, in which he puts into the mouth of Henry a bitter reproach against his dissolute queen, Marguerite, which prepared the way for an actual divorce.

The greatest of d'Aubigne's satires, as great and powerful in its way as the satires of Rabelais, and that on which his fame has chiefly hung, was a poem, the *Tragiques*, commenced as early as 1577.

Infinitely superior to Ronsard, the *Tragiques* may yet not unfairly be attributed to Ronsard's school, although the work was to the *Misères du Temps* of the master much what the *Satire Ménippée* was to an average Huguenot diatribe. It was in the *Tragiques* that d'Aubigné exemplified the intensity of his acute literary genius, the bitterness of his consuming hatred for corruption in high places. The spirit of Juvenal, or, better, the spirit of the Hebrew prophets in face of the old-world tyrannies, is matched and surpassed by the overwhelming indignation of this colossal censor of the sixteenth century, to whom the last of the house of Valois was at once the Ahab and the Heliogabalus of unhappy France.

In his *Universal History*, and in his *Memoirs*, properly called *Sa vie à ses enfants*, d'Aubigné was calmer, more impartial, not to say more dignified,

than in his controversial poems and pamphlets. His prose style is full of vigour, the product of a lofty and earnest spirit, the studied work of one who looks to be read by succeeding generations.

Courtier Historians.

D'Aubigné, as we have seen, was pleased by few men and with few things in his age, and his works are distinguished by a strong propensity to censure.

Pierre de Bourdeille, lord of Brantôme (1527–1614), is, like d'Aubigné, a censor, but, unlike d'Aubigné, he was not a moral censor, though he admires the character, as is evident in the eulogy which he passes upon de l'Hôpital. Very wide, however, was the distinction between these two serious and venerable men and the light-hearted, light-tongued biographer and scandalmonger who has given us such a piquant account of the men and women of his generation.

Pathetic passages, and passages of graphic and salacious descriptions, are the most characteristic of the writings of Brantôme.

He is the Grammont and the Pepys of his age, who, if he could have kept his eyes upon its best rather than upon its worst features, might possibly have been its Plutarch.

Amongst the graver, and at the same time more common-place and less readable contemporaries of d'Aubigné and Brantôme, who wrote the history of their generation and the memoirs of its prominent men, Philippe de Mornay (1549–1623), lord du Plessis-Marly, deserves a distinguished place. A diplomatist, a soldier, and a commentator, his writings have had a decided value in the eyes of all subsequent historians as those of a man who played no inconsiderable part in the events of the civil and religious wars of France.

More replete, more familiar, more communicative of the secret history of the age are the memoirs of Pierre de l'Estoile (1549–1623), a Parisian bourgeois, to whom no scrap of gossip came amiss.

His *Journal of Henry III. and Henry IV.* is charged with petty details of the most everyday life; and yet hardly any writer of the same epoch supplies us with so much minutely accurate material towards a full appreciation of the character of the times. His *Manifesto of the Ladies of the Court* attains to a higher literary standard.

The end of the sixteenth and the beginning of the seventeenth century embraced several writers of greatly superior historical instinct to that of l'Estoile and of a capacity and breadth at least equal to those of de Mornay. The *Letters* of Cardinal d'Ossat (1536–1604), who must be coupled with Duperron as having contributed to bring about the conversion of Henry IV., and the *Negociations* of Jeannin (1540–1622), having been described by a recent writer as the two classics of diplomatists and politicians in the seventeenth and eighteenth centuries, whilst Lord Chesterfield recommends the first work to his son as the most fit to prepare him for public business.

Armand d'Ossat began his public life as secretary to Paul de Foix, ambassador of France at the Court of Sixtus V., and most of the letters in which he communicated to his royal master the ideas and wishes of the Pope during so many delicate negotiations, were drawn up — it is said — by the young diplomatist.

Jeannin, president of the Parliament of Dijon, in his youth an ardent partisan of the League, was a diplomatist of the highest order. Successively ambassador in Spain and Belgium, he showed himself in this and in every other capacity a patriotic Frenchman and a conscientious servant of the state.

As a diplomatist Jeannin is especially famous for his mission to the United Provinces, which was attended by most important results, and virtually secured for Holland its independent position among the European states.

The *Memoirs* of Marshal Gaspard de Saulx de Tavannes (1590–1673), are less a bare history of facts than a medley of battles and politics, of commentaries and excursions upon almost every imaginable subject; the slightest suggestion being sufficient to set the biographer discoursing of assassinations, fortifications, avarice, alchemy, education, the philosophy of death, and what not.

D. Aubigné had his parallel, from many points of view, in Maximilien de Béthune, Duke de Sully (1560–1641), who, like him, was an intimate friend of Henry IV., a grave, common-sense, and cool-headed Protestant, a soldier and a statesman, and who, like d'Aubigné, had neither the chance nor the disposition to dance attendance at the court of Mary de Medici, after the star of Henry had set. Both men display the candour, the moral breadth and heighth, the calmness and self-restraint, which have been the distinguishing qualities of the French Protestants in literature as in public and private life.

The work by which Sully is best known to us is the *Memoirs*, written under his direction by four secretaries, in his country seat at Villebon. The matter is for the most part Sully's own, and it is in fact a monument of the practical, patient, sober, and serious statesmanship of the sixteenth century.

Religious Philosophy in the Classical Renaissance.

Jacques Davy Duperron (1556–1618), was a religious controversialist who displayed remarkable skill in fence, vast erudition, remarkable spirit, and courtesy in debate. It is hardly surprising that Bossuet should apostrophise such a man as a "rare and admirable genius, whose works, well-nigh divine, are the strongest rampart of the Church against modern heretics."

Duperron's extravagant eulogy of Ronsard, in the funeral oration which he pronounced upon the poet's death in 1586, undoubtedly says more for his eloquence than for his literary acumen, or even for his judgment. His writings everywhere confirm the observation.

A greater orator than Duperron, who, if he had possessed the same worldly disposition, might have risen to higher worldly dignities, and who, if he had not been made a saint, might have attained a still greater literary fame than he now enjoys, was François de Sales (1567–1622), originally a priest, then an advocate at Chambery, and again a priest, but who found his true vocation in the ranks of the priesthood. Persuasive and conciliatory, ready of wit and skilful in controversy, learned, too, as the Cardinal Duperron frankly declares, above all the logicians of his day, he could be at times vehement and even violent in his declamation.

His main work was the *Introduction à la vie dévote.* Its publication was a great success, and caused a wonderful sensation. It was almost immediately translated into all European languages, and forty editions were sold from its first publication until the year 1656. It seems to have suggested to François de Sales a second devotional work, which he was eight years in composing: *Philothée, ou traité de l'amour de Dieu.* These works, his *Sermons*, *Letters*, and one or two smaller treatises, comprising the *Standard of the Cross*, *Spiritual Conversations*, and the like, constitute his literary remains.

Amongst the friends and disciples of François de Sales — for it was impossible that such a man should have been without disciples — the only one whom we need specially mention is Camus, Bishop of Belley (1582–1653). His genius was very eccentric, and has secured for him a certain renown. As a *littérateur* he ought to have been an unfettered satirist and writer of tales, for which his sparkling wit and lively imagination particularly fitted him. The bishop of Belley is chiefly interesting to the student of literature by virtue of his attempts to adapt the novel to the language of religion, of which *Palombe* is the best known and most readable. Camus refused several large bishoprics, and finally resigned his own cure, to devote the remainder of his life as the spiritual guide of the poor patients in the Hospital of the Incurables at Paris. The ending of such a life is superior to that of any novel.

Pascal and the Port-Royalists.

Let us advance in our review of the religious philosophy of this age by the interval of a lifetime — from

François de Sales, who died in 1622, to Blaise Pascal (1623–1662), born in the following year.

Pascal was a philosopher in a double sense; for he displayed, from an early age, an almost equal talent in the pursuit of moral and mental science. At the age of sixteen he wrote a Latin treatise on *Conic Sections* which astonished even the great mathematician Descartes. At the age of nineteen he invented a calculating machine, which, in our time, has been improved and perfected by Babbage. As a young man he studied mathematics with ardour and success; adding, by his independent researches, most valuable confirmation to the discoveries of the master minds of the day — Galileo (1564–1642), Descartes and Torricelli (1608–1647). His own *Treatise on the Cycloid*, which was published only three years before his death, was written in eight days, amidst great sufferings, and whilst lying on a sick-bed. It is a notable contribution to the mathematical analysis of the infinite.

Pascal was, by inheritance and by choice, a Jansenist. (See Jansenists.) Cornelius Jansen (1585–1638) was still alive when Pascal was a young man; and the character and opinions of the austere Dutchman, who, in 1617, had been raised to the bishopric of Ypres, had produced a lasting effect upon the mind of his future apologist.

The work in which Pascal undertook the revindication of Port Royal was entitled *Letters from Louis de Montalte to a Friend in the Provinces, and to the Reverend Fathers the Jesuits, concerning the Morality and the Methods of the said Fathers.* These *Provincial Letters*, as they are usually called, are at once an attack upon the Jesuits and a defence of the Jansenist opinions called in question by the Pope and the Sorbonne; and their effect was fully as great as the author's most sanguine friends had anticipated. The first letter contains an ironic exaltation of the authority of the Sorbonne, "*mons parturiens*" to end as in the old classical story so often told with a "*ridiculus mus.*" The second letter is about "sufficient grace, in which there are two things, the sound which is only wind and the thing which it signifies." The third is about the condemnation of Arnauld, in which is the following phrase to be found: "the cleverest men are those who intrigue much, speak little, and do not write at all." In the rest of his letters, from the fourth to the nineteenth and last, he attacks the casuists, who are the Jesuits, by all the means in his power — by raillery, reasoning, passion, eloquence, and logic.

The Hôtel De Rambouillet.

Prominent amongst the leaders of fashionable vice and recklessness of conduct in the seventeenth century, with their inseparable concomitant in the case of the least cultivated classes — coarseness of manners, were women so highly placed, and so necessarily influential, as Catherine de Medici, Mary de Medici, and, most dissolute of the three, Marguerite de Valois. It was impossible that the example of these three queens should not have given a powerful impulse to the moral degradation of Frenchmen.

The intellectual and moral tone of society in this century was wonderfully raised by Catherine de Vivonne (1588–1665), the young and noble-minded wife of the Marquis de Rambouillet. The daughter of an Italian mother, married at a very early age, and brought suddenly amidst the gaiety and the license of the court of Henry IV., a mother before she was twenty, her mind speedily recoiled from the gilded hollowness of a society which had so few charms for her. She retired, about the year 1608, to her husband's private house, and was at once sought out by admirers as distinguished as Malherbe and Racan. The best literary men, the purest and most refined women, preferred her house to the salons of the king and the cardinal. Such *réunions* as the marquise held night after night, first in her husband's old hôtel, and subsequently in a grand and elegantly furnished mansion for which she herself had supplied the design, were very rare, if not hitherto unknown in Parisian society. Be that as it may, we must regard Madame de Rambouillet as the pioneer of her countrywomen in the fashion of elegant entertainments, which became, a little later, one of the most characteristic features of Parisian society.

Amongst the earliest favorites of the marquise, in addition to Malherbe and Racan, was Cospeau (1568–1646), who had been Richelieu's tutor, a grave and eloquent preacher, well advanced in years, like the two poets, but not on this account less acceptable to his young and discriminating hostess. After these came Chapelain (1595–1674), the future author of *La Pucelle;* a subject which might well create an epic poet in a nation whose literary genius was not wholly inapt for the epic vein, but which, like Ronsard's *La Franciade*, proved a dreary failure; though Chapelain was a good scholar, and as a critic deserves more of his country by his judgment of others than by the fruits of his own commerce with the muses; Gombauld (1570–1666), the author of a poem called *Endymion*, in which he was supposed to have depicted his love for the queen; the Italian Marini (1569–1625), who wrote *Adonis*, dedicated to Louis XIII., to which Chapelain prefixed a laudatory introduction; Voiture (1598–1648); Conrart (1603–1675); Godeau (1605–1672), who for his diminutive size was called "Julie's Dwarf," and who, through the favor of the marquise, was afterwards promoted to a bishopric; the diminutive Marquis du Vigean; the Marshal de Souvré (1542–1626), and his daughter, the well-known Marquise de Sablé (1598–1678); the Duke (1620–1672) and Duchess de la Trimouille, and the young bishop of Lucon, afterwards the Cardinal de Richelieu (1585–1642). Amongst the ladies came Madame Aubry; a friend and correspondent of Voiture's, Mademoiselle Paulet; these two endowed with excellent voices, with which they were wont to add to the charms of the Hôtel de Rambouillet; Madame Saintot; the Princess de Montmorency (1594–1650), and Anne de Bourbon (1619–1679).

After the civil war, the first charm had departed, or, at all events, it was changed for a charm more artificial, and the refinement which had attracted all Paris began to give place to an affectation at which almost all Paris laughed. It was only towards the close of Madame de Rambouillet's life that her school of manners and of literature deserved the name of *précieuse*. Molière, who slew it with his ridicule, was well able to discriminate between the diamond and the paste.

It was not Madame de Rambouillet and her daughter, nor such as their later adherents, as Mademoiselle de Scudéry (1607–1701), and Madame de Sévigné (1626–1696), whom the great satirist desired to ridicule in the characters of Madelon and Cathos, but only the glib dealers in an easily affected phraseology, who turned the purism of Malherbe, Racan and Voiture into a ridiculous jargon.

The great romancist of the set was Mademoiselle de Scudéry, whose novels supplied the later *précieuses* with their art of love, their code of manners and sentiments. *Le Grand Cyrus* and *Clelie* are conceived in the full flavor of the spirit which governed the Hôtel de Rambouillet before its earlier glories had faded.

The last of the ten long-winded volumes of *Clélie* appeared in the year of the Marquise de Rambouillet's death; the date of the first volume in 1654; that is, it covers the latest and least wholesome phase of the *coterie*. It is in the first portion of the work that the map of the country of Tenderness is introduced.

According to this love-chart there are in the country of Tenderness three rivers — Inclination, Esteem and Gratitude. If anyone wishes to go from the town New Friendship to the City of Tenderness, near the River Esteem, he has to traverse the villages Great Wit, Charming Verse, Love-Letters, Sincerity, Noble Heart, and many more with similar names. But if the traveller loses his way and strays to the village Negligence, he will fall into the lake of Indifference; and if he strays to the left he may, after having gone through the villages of Indiscretion, Perfidy, Pride, Slander and Wickedness, be finally

drowned in the sea of Enmity. This is no unfair example of the manner and treatment of Mademoiselle de Scudéry's romances.

The *Guirlande de Julie* may perhaps be considered as the best literary outcome of the Hôtel de Rambouillet, apart, of course, from the letters and memoirs in which its history is recorded.

It consisted of an album of verses, composed in honor of Julie d'Angennes, at the instance of the Marquis de Montausier, during the weary years of his protracted courtship.

The devoted lover himself wrote sixteen; Voiture and Racan are conspicuous by their absence.

The other writers were Arnauld d'Andilly, father and son, de Corbeville, de Briotte, Chapelain, Colletet, Corneille, Desmarets, Godeau, Gombauld, Habert de Montmort, Habert de Cérisy, a third Habert, *commissaire* in the artillery, Malleville, Martin de Pinchesne, Scudéry, Tallemant des Réaux and the Marquis of Rambouillet.

Two ladies of the court of Madame Rambouillet, who had both been the pupils of Chapelain and Ménage, and who have both left behind them works of considerable literary merit, deserve to be specially noticed here, although they lived far into the reign of Louis XIV.; Madame de Sévigné, grand-daughter of Madame de Chantal, formerly mentioned, and Madame de la Fayette (1634–1693).

Left a widow at the age of twenty-five, Madame de Sévigné devoted herself simultaneously to the care of her children and to intellectual pursuits. The evidences of her wit, her sprightly criticism, her learning and her literary appreciation, are preserved in a number of very entertaining letters. Almost all of them are well written, lively and gossipy, and those to her married daughter, Madame de Grignan, bear proof of great critical acumen and a rather overmotherly affection. They have been much read and esteemed in each succeeding generation.

Madame de la Vergne, Countess de la Fayette, whom Rochefoucauld describes as "the most genuine person in the world," was eight years younger than Madame de Sévigné, and was only twenty-one at the death of Madame de Rambouillet. Her first work was printed five years before the latter's death, under the title of *The Princess de Montpensier*. Her chief talent was in romantic biography, and she left behind her two books containing the ripest fruit of her well trained and judicious mind, *History of Henrietta of England* and *Memoirs of the Court of France during the years* 1688 *and* 1689. In the meantime she had published *Zayde*, a Spanish tale, and *The Princess of Cleves*, the story of an honest married woman in love with another man than her husband; both short novels told in a charming, delicate and attractive manner.

She laid the foundation of the novel proper, or story of analysis of character; and towards the close of the century the fairy tale attained, in the hands of Anthony Hamilton, Perrault and Madame d'Aulnoy, its most delightful and abundant development.

Literary Coteries.

After the death of Madame de Rambouillet, the sway of fashion and letters in France may be said to have been transferred to Mademoiselle de Scudéry, whose "Saturday Receptions" almost rivalled the brightest assemblies of Arthénice. But affectation reigned supreme in the house of the authoress of *Clélie*. All who frequented it had assumed names chosen for the most part from the romances of the day.

The hostess herself was known as Sappho, Sarasin (1624–1693) was Polyandre, Conrart was Theodamas, Pellisson was Acanthe, or *le Chroniqueur*, because he was charged with immortalizing the annals of the *coterie*. Ysarn (1637–1673) was Zénocrate, Godeau, who, at the Hôtel de Rambouillet, the author of *The Speaking Pistole*, had been "Julie's dwarf," was here dignified under the name of the Magus of Sidon, or the Magus of Tendre. The wit of these *réunions* was often very sparkling and well sustained.

It was an age of literary extravagance, as well as of great culture — an extravagance in more than one or two aspects, when every day produced some ridiculous epigrams, anagrams, *bouts-rimés* monorimes, protean verses, and a dozen other ingenious trifles of Ménage and his less known friends, amongst whom Commire, Boivin, Faydit, may be simply named.

As a rival of Madame Scudéry, Hédelin, Abbé d'Aubignac (1604–1676), author of a *History of the Time or Record of the Kingdom of Coquetry, taken from the last voyage of the Dutch to the Indies of the Levant*, which was no doubt in part an imitation of the peculiar *genre* of Mademoiselle de Scudéry, and which excited the latter's jealousy, formed a *coterie* at his own house, for which, being patronised by the Dauphin, he endeavored to obtain the title of Royal Academy; but his wish was fortunately not granted. Another Abbé of the same age, Cotin (1604–1682), was a man of some spirit, and of a certain grandeur and dignity in the making of verses. He published in 1634 *Jerusalem in Desolation; or Meditations on the lessons of darkness;* and subsequently essays on *Philosophy*, on the *Immortal Soul*, *Christian Poems*, *a Paraphrase on the Song of Solomon*, as well as a collection of *Enigmas* and *Rondeaux*. He, too, had a quarrel with Mademoiselle de Scudéry, and with all her school, against whom he wrote bitter things in his *Œeuvres Galantes*.

Satirists of the Period.

The best of the literary men of this period was Théophile de Viau (1590–1626), a poet of great ease and brilliancy, the Coryphæus of a band of young and well-born courtiers who defied all attempts to set bounds to the indulgence of their appetites.

His dramas do not do him much credit, their style being exaggerated and "precious." On the other hand, his miscellaneous poems, though very unequal, include much work of remarkable beauty. The pieces entitled "La Solitude," "Surune Tempête," and the stanzas beginning "Quand tu me vois baiser tes bras," have all the fervour and picturesqueness of the Pléiade, without its occasional blemishes of pedantic expression. After extravagance and eccentricity, satire follows as a matter of course.

The True Comical History of Francion, by Charles Sorel (1602–1674), Sieur de Souvigny, appeared first in 1622, and made a great sensation. It was not long in running through sixty editions, being occasionally enlarged and reinforced by new allusions and illustrations. Its first title was *The Comic History of Francion, a Scourge of the Vicious*, and its authorship was veiled under the assumed name of Nicolas de Moulinet; and in his *Bibliothèque Gauloise*, published in 1664, a sort of *catalogue raisonné*, Sorel denies having written it.

Sorel was distinctly a comic romancist, and he hits the school of d'Urfé tolerably hard in the *Extravagant Shepherd*.

The *Roman Bourgeois* is an original and lively book, without any general plot, but containing a series of very amusing pictures of the Parisian middle-class society of the day, with many curious traits of language and manners. It was published in 1666.

But it was in the *Francion* that he launched his satires with most effect and most comprehensively.

Richelieu and his Work.

Armand Jean du Plessis, Cardinal Richelieu (1585–1642), is the central historical figure of the age whose literary annals we have been tracing. He is the man who dealt French feudalism a blow from which it never recovered, who raised France to the strongest and proudest positions amongst the nations of Europe, and who, himself an author, patronised letters and arts, founded the Academy, and emphasised by his death the close of the later Renaissance.

As a patron of literature and a *littérateur* Richelieu deserves attention. He wrote a *Defence of the Chief Points of the Catholic Faith against the Letter of four* (Protestant) *Ministers of Charente*. The pamphlet is crude and bitter enough in style; but it is distinguished by a warm plea for toleration in mat-

ters of religion, and, in fact, makes it a charge against the Calvinists that they would refuse liberty of conscience. A second and more important work, written in the same year, and which has passed through as many as thirty editions, was the *Instruction of a Christian*. But a more characteristic, perhaps a better work than either of these was his tragi-comedy *Mirame*, the reputed produce of his riper leisure, after many years' intercourse in the drawing-rooms of Paris with all that they included of refinement and learning, and in which he certainly had a hand, if he did not wholly write it. His *Memoirs*, which he himself called a *History of Louis XIII.* form a copious and very serviceable storehouse of facts and elucidations for historians of the time. This detailed narrative ends at the year 1638, with the birth of Louis XIV. From this point to the close of his life he wrote a succinct *Narrative of the Great Deeds of the King*—a title appropriate in all save the last word. Another work, much wider in scope and distinguished by many statesmanlike inferences and generalisations, the *Political Testament*, has commonly been ascribed to Richelieu.

This work Voltaire declined to accept as the work of the Cardinal, even after the first chapter had been found revised and corrected in Richelieu's own handwriting. The balance of evidence would seem to favour the assertion of Montesquieu, that the *Testament* was written under the eyes and by the direction of Richelieu, in much the same manner as the *Memoirs* of Sully.

One of Richelieu's greatest works, after all, was the definite establishment of the Academy. Through his efforts it was incorporated as the Académie Française, it having been previously styled the Academy of Wits, the Academy of Eloquence, and the Eminent Academy.

The number of *fauteuils* was forty from the beginning. Lalanne gives a complete table of their successive occupants, wherefrom we will copy one. Original member, Fr. Maynard; 1647, P. Corneille; 1685, T. Corneille; 1710, De la Motte; 1731, Bussy-Rabutin; 1737, Foncemagne; 1780, Chabanon; 1795, Naigeon; 1810, N. Lemercier; 1841, Victor Hugo. Amongst those who have never sat in the Academy are Molière, la Rochefoucauld, Regnard, Lesage, J. J. Rousseau, Béranger, and, naturally enough, the independent lexicographers. In fact an academician, Furetière, despairing of seeing the Academy's dictionary completed, began one on his own account; whereupon (in 1685) he was expelled from the society. He had his revenge, both by lampooning the Academy, and by publishing his dictionary.

No doubt many of the first academicians were well worthy of their seats. Maynard, Voiture, Vaugelas, l'Etoile, Balzac, Saint-Amant, Racan, Godeau, Chapelain, Conrart, are names which would adorn the books of any society of literary men. In 1638 the Academy resolved upon compiling a dictionary of the French language, and Chapelain and Vaugelas submitted plans for it. That of the first-named was selected, and a list of authors was drawn up from whom the examples were to be taken.

This list includes, for prose, Amyot, Montaigne, du Vair, Desportes, Charron, Bertaud, Marion, de la Guesle, Pibrac, d'Espeisses, Arnaud, the *Catholicon* from the *Satire Ménippée*, the *Memoirs* of Marguerite of Navarre, Coeffeteau, Duperron, de Sales, d'Urfé, de Molières, Malherbe, Duplessis-Mornay, d'Ossat, de Lanoue, de Dammartin, de Refuge, d'Aubigné, and —— Bardin and du Chastelet, as a matter of course; these two being academicians already deceased. To represent the poets were chosen Marot, Saint-Gelais, Ronsard, du Bellay, du Bartas, Desportes, Bertrand, Duperror, Garnier, Regnier, Malherbe, des Lingendes, Motin, Touvant, Monfuron, Théophile, Passerat, Rapin, and Sainte-Marthe. To Vaugelas (1585–1650), a Savoyard by birth, and a man of great judgment and refinement, was entrusted the care of editing this important work.

Descartes.

René Descartes (1596–1650) was more than forty years old when he published his first work, a *Discourse on the Method of Regulating the Reason and of Inquiring after Scientific Truth*. Four years later appeared his *Metaphysical Meditations;* and less than six years before his death he gave to the world the *Principles of Philosophy*. He did not write much, but preferred to think and wait; keeping, it would seem, his body in perpetual activity, and selecting such pursuits as would leave his mind most free.

No prose style amongst the various styles of his contemporaries was at once more dignified, more characteristically French than that of Descartes, and at the same time more closely modelled upon, and, as it were, translated from the Latin diction. So much is this the case that enthusiastic critics have extolled the language of Descartes as a very pattern of French prose, worthy of all imitation, and all but incapable of improvement. The praise appears to us to be exaggerated; for Descartes was often prolix and even cumbrous; eminently severe, logical, and effective, but exacting a sustained attention, and destitute of almost every adornment save that of an unbroken lucidity of thought and method.

The Age of Louis XIV.—The Court and its Influence.

The age of Louis XIV. has been called the Augustan age of French literature, and not without sufficient reason. It was the age of maturity, both in thought and style; the age of the classical drama, tragic and comic; of classical prose, oratorical, historical, and didactic; the age of excellence in a *genre* which, perhaps as distinctly as anything else, characterises the French genius in memoirs and polite correspondence; the age of order, precision, harmony in literary ideas, of arrangement, correctness, elevation in literary expression.

We have already trenched considerably upon the age of Louis XIV. It was during his minority that the troubles of the Fronde broke forth, and were finally suppressed by Anne of Austria (1601–1666) and Cardinal Mazarin (1602–1661). Voiture died in the fifth year of his reign, Descartes and Vaugelas a couple of years later, and Balzac five years after that. Louis attained his majority in 1651, and it was in 1653 that Innocent X. condemned the five propositions extracted from the works of Jansen by his enemies, which condemnation led to the production of the *Lettres Provinciales*. Corneille was at the height of his fame before the king ascended the throne, but his career extended over more than forty years of Louis' reign. Nevertheless it is not without sufficient reason that the age of the later classical Renaissance is carried beyond the middle of the seventeenth century, and that the age of Louis XIV., in so far as it may be described as distinctively Augustan, is limited to the last fifty, or at most sixty years of his life. The *Grand Monarque* arrived at the exercise of his full royal dignities only at the death of Mazarin (March 9, 1661).

The king's patronage and encouragement of letters were not confined to the exercise of his power of polite conversation, nor to the munificence with which he showered pecuniary rewards upon men distinguished in literature, science, and art. The Academy had special reason to be grateful, both to him and to Colbert, who occupied the *fauteuil* first accorded to Silhon (1596–1667), and who, in 1666, established the *Académie des Sciences*.

Molière.

The drama attained its highest excellence and repute in the age of Louis XIV., and we should not be making a very hazardous assertion if we were to say that the literature of that epoch in France attained its height of glory in the drama. No French dramatist has excelled Molière, Corneille, and Racine; no group of authors in the seventeenth century were more brilliant, more powerful, more originative.

Jean Baptiste Poquelin, who subsequently assumed

the name of Molière (1622–1673), was born in the year that François de Sales died, one year after the birth of La Fontaine, four years before the birth of his friend Chapelle and of Madame de Sévigné.

It would be difficult to fix the exact date at which Molière's earliest plays were produced, but it is probable that he began to write for his company as soon as he had enlisted in it. He seems, like Shakespeare, to have, in part at least, adapted the plays of others; but in the year 1653, if not earlier, he had produced *l'Etourdi*, and in 1656 *le Dépit Armoureux*. In 1659 Molière took Paris by storm with his *Précieuses Ridicules*, a satire in one act on the exaggerations of the hôtel de Rambouillet. This was followed in the succeeding year by *Sganarelle ou Le Cocu Imaginaire;* in the beginning of 1661 appeared *Don Gracie de Navarre*, a heroic piece in five acts, intended to delineate the evils of passionate jealousy; and in the same year were produced *l'Ecole des Maris*, a satire on unreasonable jealousy, and *Les Fâcheux*, a court sketch of several kinds of bores; in 1662 *l'Ecole des Femmes*, an attempt to show the danger of bringing girls up in too strict a manner, with its sequel, the *Critique de l'Ecole des Femmes*, in the year after. In 1664 he wrote the *Mariage Forcé*, a one-act piece with eight *entrées de ballet*, specially designed for court representation, in which the king himself was pleased to dance; and, a month or two later, the *Princesse d'Elide*, a cumbrous and comparatively inferior production, done in great haste at the command of Louis XIV., who had determined upon an eight days' festival in honour of Louise de la Vallière.

It was during these festivities that, for the first time, was represented the first three acts of Molière's masterpiece, *Tartuffe ou l'Imposteur*, a play well worthy of the best and most legitimate subject which satire can have to deal with. It was interdicted for a time.

Don Juan ou le Festin de Pierre, a piece in which a nobleman, who is a libertine as well as a sceptic and a hypocrite, is brought upon the stage, was first acted in February, 1665, and raised such an outcry that it was also forbidden to be played. In September, 1665, appeared *l'Amour Médecin*, a comedy in three acts, in which a lover appears disguised as a physician, to cure the object of his love, who pretends to be dumb, and in which Molière makes his first serious attack against the doctors. In June, 1666, the *Misanthrope* was introduced to the public—a play which has been ranked as high in comedy as *Athalie* is ranked in French tragedy. In 1669 appears *Monsieur de Pourceaugnac*, a farcical comedy in three acts, in which there is a masterly and not exaggerated sketch of a consultation of doctors in Molière's time; and in 1670, the *Bourgeois Gentilhomme*, in which the folly of aping noblemen is delineated, as well as the *Amants Magnifiques*, a comedy-ballet for the particular behoof of the court. In 1671 he combined with Corneille and Quinault in the production of *Psyché*, a tragedy-ballet, and wrote, or rather, perhaps, remodelled from amongst his earlier efforts, the *Fourberies de Scapin* and the *Comtesse d'Escarbagnas*. His last two works were amongst the highest and happiest creations of his genius—the *Femmes Savantes*, a sort of sequel to the *Précieuses Ridicules*, though of a more general application, and the *Malade Imaginaire*.

Molière placed upon the stage nearly all human passions which lend themselves to comedy or farce. Sordid avarice, lavish prodigality, shameless vice, womanly resignation, artless coquetry, greed for money, downright hypocrisy, would-be gentility, self-sufficient vanity, fashionable swindling, misanthropy, heartlessness, plain common sense, knowledge of the world, coarse jealousy, irresolution, impudence, pride of birth, egotism, self-conceit, pusillanimity, ingenuity, roguery, affectation, homeliness, thoughtlessness, pedantry arrogance, and many more faults and vices, find their representatives. The language which they employ is always natural to them, and is neither too gross nor over-refined.

La Fontaine.

Amongst the friends of Molière was one who deserves to be mentioned immediately after him, as well on other grounds as because he was a fellow-dramatist, a writer or at least a *collaborateur* of comedies of no mean merit. Jean de La Fontaine (1621–1695) is better known as the author of fables and licentious tales in verse than as a worker for the stage; but yet the original bent of his mind seems to me to have been for dramatic literature, and even at an early age he wrote an imitation in verse of the *Eunuch* of Terence. He wrote an elegy on behalf of Foquet addressed to *the Nymphs of Vaux*, and an *Ode to the King*, in the year 1663. Next year he published a collection of *Tales*, and seven years later a series of *Nouvelles*, the subjects whereof were taken principally from Boccaccio. It was in 1668, when he was forty-seven years old, that he issued the first collection of his *Fables*, and six more appeared between the years 1671 and 1694; the last and perhaps the weakest, only a year before his death. In the meanwhile he had written three mythological poems—the *loves of Psyché*, *Adonis*, and *Philemon and Baucis*, the most natural of the three. Amongst his comedies the judgment of the later times has declared in favour of the *Enchanted Cup*, which is still, or was until lately, in the repertory of the Theâtre Français.

La Fontaine is perhaps the most finished of French poets. His tripping vivacity of metre makes him never wearisome, and his poetry never monotonous—as French poetry very often is. His pictures are perfection, his dialogue is animated, his personages are natural, and never say too much or too little; the action of his fables never flags. We are therefore justified in calling him one of the first-rate dramatists of his age.

Minor Dramatists.

Amongst the plays more or less frequently acted in Paris at the time when Molière's literary career began, were those of Paul Scarron (1610–1660) and Georges de Scudéry. The former, ill-shaped in body and fantastic in mind, a buffoon by nature and choice, burlesqued all that he put his hands to, avoiding grave subjects and modes of treatment with unfeigned repugnance. He turned the *Æneid* into a travesty, produced the *Typhon*, a burlesque poem, and wrote in prose perhaps the most notable of his works from a literary point of view, the *Roman Comique*, describing to the life and without exaggeration the adventures of a company of strolling players, in a style of which some early Spanish novelists furnished the best examples. He was the inaugurator of French burlesque—a name invented by his friend Sarasin (1605–1654) instead of the less specific *grotesque*.

Scarron was the first Frenchman who expanded the *esprit narquois* from an interjection or a phrase into the dimensions of a narrative or a chapter of gossip. The satire of the age was not good-natured: witness above all the pages of Tallemant des Reaux, the prying and quizzing biographer of his contemporaries. Good-humor did not thrive in the days of the Fronde; and Scarron writes the language of disgust and discontent, revolting against sorrow and disgrace with the fixed determination to force himself and all his hearers into a loud and long guffaw.

Scarron wrote several comedies in verse; one *l'Héritier ridicule* (1649), which, it is said, Louis XIV. desired to see acted twice in one day; and several about *Jodelet* and his adventures. *Don Japhet d'Arménie* is considered his best play, but it is very coarse and licentious. In his *Ecolier de Salamanque*, Crispin appears for the first time on the stage.

Georges de Scudéry (1601–1667), the brother of Mademoiselle de Scudéry, of whom we have already spoken, determined, after an excellent education, and after having followed the profession of arms, to devote himself to poetry and the drama. He edited the poems of Théophile de Viau (1632), wrote *The Tomb of Théophile*, and showed already in the preface his vanity and self-conceit.

His first play, *Lygdamon ana Lydias*, represented in 1629, was printed in 1631, and dedicated to the young Duke de Montmorency.

In the last-named year he put upon the stage *The Deceiver Punished*, a tragedy in verse, which was followed in succession by fourteen others. His *Amour Tyrannique* is vigorous and bombastic. But perhaps the best of all his plays is his *Comedy of the Comedians*, first performed in 1634. His ambition to excel the author of the *Cid* led to the production of his two most respectable tragedies, *Ibrahim, or the illustrious Bashaw*, and *Arminius*.

Amongst the minor dramatists of the age of Louis XIV. Edme Boursault (1638–1701) deserves a prominent place.

His comedy *le Mercure galant* contains more than one genuinely ludicrous situation; whilst his two comedies, *Esope à la Cour* and *Esope à la Ville*, met with great success.

Regnard (1638–1701), author of the *Joueur*, the *Légataire*, and the *Ménechmes*, has earned a higher reputation than Boursault. Boileau says of him little more than that he is in no small degree funny; and perhaps no one would be likely to derive from his comedies any greater benefit than arises from a hearty, self-forgetting laugh.

Claveret and D'Aubignac (the latter of whom was an active critic as well as a bad play-wright) principally derived their reputation, such as it is, from the acerbity with which they attacked Corneille in the dispute about the Cid; nor should the name of Théophile de Viaud be passed over in this connection. His *Pyrame et Thisbé* is often considered as almost the extreme example (though Corneille's *Clitandre* is perhaps worse) of the conceited Spanish-French style in tragedy. The passage in which Thisbe accuses the poniard with which Pyramus has stabbed himself of blushing at having sullied itself with the blood of its master is a commonplace of quotation. Yet, like all Théophile's work *Pyrame et Thisbé* has value, and so has the unrepresented tragedy of *Pasiphaé*.

Among these forgotten names, and others more absolutely forgotten still, that of Rotrou is pre-eminently distinguished. Jean de Rotrou (the particle is not uniformly allowed him) was born at Dreux in 1609, and was thus three years younger than Corneille. He went earlier to Paris, however, and at once betook himself to dramatic poetry, his *Hypocondriaque* being represented before he was nineteen. He formed with Corneille, Colletet, Bois-Robert and L'Etoile, the band of Richelieu's "Five Poets," who composed tragedies jointly on the Cardinal's plans.

By common consent *Le Véritable Saint Genest* and *Vences las* are Rotrou's best productions.

The chief work of Tristan, who was also a poet of some merit, was *Marianne* (Mariamne), very closely modelled on an Italian original, and much less vigorous, though more polished than Hardy's play on the same subject. Du Ryer had neither Mairet's vigour nor Tristan's tenderness, but he made more progress than either of them had done in the direction of the completed tragedy of Corneille and Racine.

Pardon, whose success against *Phédre* so bitterly annoyed Racine, was a dramatist of the third or even the fourth class, though he enjoyed some temporary popularity. Campistron, a follower rather than a rival of Racine, was a better writer than Pardon, but pushed to an extreme the softness and almost effeminacy of subject and treatment which made Corneille contemptuously speak of his younger rival and his party as "les doucereux." Quinault, before writing good operas and fair comedies, wrote bad tragedies. The only other authors of the day worth mentioning are Duchè and Lafosse. Lafosse is a man of one play, though as a matter of fact he wrote four. In *Manlius* he gave Roman names and setting to the plot of Otway's *Venice Preserved*, and achieved a decided success.

He wrote twenty-three plays (including one tragedy of no value) and collaborated with Dufresny in four others. Many of these pieces were comic operas. At least a dozen were represented by the "Maison de Molière." The best of them are *Le Joueur*, *Le Distrait*, *Les Ménéchmes*, *Le Légataire*, the first and the last-named being his principal titles to fame.

Baron the actor was born in 1643 and died in 1729, after having long been the leading star of the French stage. He wrote, though it is sometimes said that he was aided by others, seven comedies. One of these, *L'Andrienne*, is a clever adaptation of Terence, and another, *L'Homme aux Bonnes Fortunes*, has considerable merit in point of writing and of that stage adaptability which few writers who have not been themselves actors have known how to master.

Charles Rivière Dufresny, a descendant of "La Belle Jardinière," one of Henri IV.'s village loves, was born in 1648 and died in 1724. His comedies were numerous and full of wit and knowledge of the world, but somewhat destitute of finish. Besides those in which Regnard collaborated he was the author of eleven pieces, of which *L'Esprit de Contradiction*, *Le Double Veuvage*, *La Coquette de Village*, and *La Réconciliation Normande* are perhaps the best.

Florent Carton Dancourt was born in 1661 and died in 1725. The great peculiarity of his comedies is that they deal almost exclusively with the middle class. *Les Bourgeoises de Qualité* and *Le Chevalier à la Mode*, perhaps also *Le Galant Jardinier* and *Les Trois Cousines*, deserve mention.

The collaboration of Brueys and Palaprat resulted in the modern version of the famous mediæval farce, *L'Avocat Pathelin*, and in an excellent piece of the Molière Regnard type, *Le Grondeur*. Some other plays of less merit were written by the friends, while each is responsible for two independent pieces. Both were Provençals, David Augustin de Brueys having been born at Aix in 1640, Jean Palaprat at Toulouse ten years later.

The Moralists.

The written eloquence of the seventeenth century, and of the age of Louis XIV. in particular, is hardly less brilliant than the beauty of its poetical productions.

The prose of the Augustan age of French literature, setting aside mere translations from the ancients, which indeed were not many, inasmuch as the classical Renaissance had cleared off most of what there was to be done in this respect, was employed in four principal literary *genres:* philosophy, as exemplified by Descartes, morality, as diversely exemplified by Pascal and La Rochefoucauld, memoirs and correspondence. In the last of these *genres* the talent of Guez de Balzac (1597–1665) is supreme.

Jean-Louis Guez, Seigneur de Balzac, was born at Angoulême, and was a central figure of society in the first half of the seventeenth century. He was one of the original members of the Academy.

Years before he had seen Madame de Rambouillet he dedicated to her more than one of his books, such as *Le Romain* and *La Vertu Romaine*, in which he pays many delicate compliments to the object of his gallant admiration.

The style of Guez de Balzac, which may be favourably studied in many of his *Letters*, as well as in the best of his essays, such as those on *The Prince*, *Aristippus, or the Court*, and the *Christian Socrates*, is perhaps the finest example of French prose to be met with in the first half of the seventeenth century: better that that of Descartes, better even than that of La Rochefoucauld.

François, Duke de la Rochefoucauld (1630–1680), Prince of Marsillac, a soldier, a historian, and yet better known to posterity as a moral philosopher, whose maxims have produced so vast a practical influence upon his fellow-countrymen in succeeding ages. La Rochefoucauld was, in an emphatic sense, the creation of the times in which he lived; not only the creation but the instrument, shaped by the circumstances which surrounded him, and used, like a worthy tool, for lofty purposes.

In 1662 were published the *Memoirs of the Regency of Anne of Austria*, and three years later appeared his *Reflections and Opinions, or Moral Maxims*. It is upon the latter work that his fame will always chiefly rest. An acute observer rather than a dogmatist or theoriser, his reflections on the moral basis of human action strike the reader as the ingenious deductions of a shrewd man of the world from the events which have passed day by day before his eyes, and as the essence extracted from a close study of and insight into human character. Clearly and concisely expressed, in terse idiomatic French, which aims at none of the effects of rhetoric, each of his pithy sentences catches the understanding and arrests the attention of the reader. There was nothing previously published in France with which they might be compared; and if anything of more recent date, such as the numerous good things of Talleyrand, can be placed upon the same level with them, it is only in books of table-talk, of biography, of compiled anecdotes and *bons mots* that we shall encounter them. The *Thoughts* of Pascal are more elaborate, more discursive and disquisitional. They excel the maxims of La Rochefoucauld in literary style, in brilliancy and moral force; but, published five years later, they do not obscure the originality, or decrease the literary significance of La Rochefoucauld's work.

Historians.

Jean François Paul de Gondi, afterwards Cardinal de Retz (1614–1679), was noted for his *Memoirs*. Of them Voltaire has remarked that they were written with an air of grandeur, an impetuosity of genius, and an inequality, which are the characteristics of his conduct. Another of his countrymen, Sainte-Beuve, speaks more warmly still. He says: "The style of de Retz is of the finest order of speech; it is full of fire . . . and unites to grandeur a supreme air of negligence, which constitutes its charm. Its expression is often lively, picturesque in its flow, always suited to the genius of the French language, yet full of imagination, and, at times, of magnificence."

The Memoirs of Guy Joly, a lawyer and the friend and confidant of Retz, in a manner supplement this latter's work. Joly was faithful to his master even in exile, but at last they quarreled, and the Memoirs do not always throw a very favourable light on the proceedings of the turbulent cardinal. They are very well written. Claude Joly, the uncle of Guy, an ecclesiastic, has also left anti-Mazarin writings of less literary worth.

Of very great importance historically, and by no means unimportant as literature, are the Memoirs of Pierre Lenet, a man of business long attached to the house of Condé. These memoirs are, in fact, memoirs of the great Condé himself, until the peace of the Pyrenees. Personal and literary interest both appear in a very high degree in the Memoirs of Anne Marie Louise de Montpensier, commonly called La Grande Mademoiselle.

To Paul Phélypeaux de Pontchartrain (1566–1621) we owe a somewhat jejune but careful and apparently faithful account of the minority of Louis XIII. A short and striking relation of the downfall of Concini is supposed to be the work of Michel de Marillac, keeper of the seals (1573–1632), afterwards one of the victims of Richelieu. Henri de Rohan (1579–1638) is very far superior to the writers just named. Besides his memoirs he wrote a book called the *Parfait Capitaine*, and some others. The memoirs extend from the death of Henri IV. to the year 1629, and have all the vigour and brilliancy of the best sixteenth-century work of the kind. Of still greater personal interest are the memoirs of François Marechal de Bassompierre, another of the adversaries of Richelieu, and who, less fortunate than Rohan, languished twelve years in the Bastille. Few persons played a more active part in the first years of the reign of Louis XIII. than Bassompierre, and no one has left a livelier description, not merely of his own personal fortunes, but of the personality of his contemporaries, the habits and customs of the time, the wars, the loves, the intrigues of himself, his friends and his enemies. He has not the credit of being very accurate, but he is infinitely amusing. His memoirs were written during his sojourn in the Bastille. Among the most curious and not the least interesting of the works of this class are the memoirs of Pontis — one of the famous solitaries of Port Royal in his old age. Pontis died at the age of eighty-seven, and had been for fifty-six years in the army. His memoirs, which are strictly confined to his personal experiences, obtained the approbation of two such undeniably competent judges as Condé and Madame de Sévigné, and are by no means unworthy of the honour. The actual composition of the memoirs is said to be the work of Thomas du Fosse. Pellisson wrote a history of the Academy, of which he was secretary, and one of the living Louis XIV., which, as might be expected, is little more than an ingenious panegyric. The Père Daniel wrote a history of France, the Père d'Orléans one of the English revolutions; while Rapin de Thoyras, a Huguenot and a refugee, had the glory of composing in a foreign language the first book deserving the title of a History of England. César Vichard, Abbé de Saint Réal, was born at Chambery in 1631, and died at the same place in 1692. He was sent early to Paris, betook himself to historical studies, and published various works, including certain discourses on history, a piece on Don Carlos, and the *Conjuration des Espagnols*.

Amongst the other historians of the earlier part of the *Grand Monarque's* reign was François Eudes de Mézeray (1610–1683). In 1667 he published a *Chronological Abstract of the History of France*, which, if neither very eloquent nor very philosophic, yet bears evidence of his industry and straightforwardness. Afterwards he wrote a highly appreciated *History of France*.

A contemporary lady author of *Memoirs*, chiefly biographical, was Madame de Motteville (1621–1689). Her *Memoirs* extended over the period between the marriage and death of Anne of Austria; and besides being valuable as a contribution to the history of the age, they are written with no small amount of elegance and spirit.

Another minor historian of the age of Louis XIV., Bussy-Rabutin (1618–1693), was one of those men who have had no further tendency of literary fame than a lease terminating with their lifetime, and who have "shone in the world to be eclipsed by posterity," and though, from one point of view and in respect of one of his works, his *Histoire Amoureuse*, he must be considered eminently readable, his literary repute has always been more or less at a discount. In 1665 he issued a *Histoire Amoureuse des Gaules*, a scandalous and loose chronicle.

Of the Comte de Brienne, who was a favourite and minister of Anne of Austria, and whose book contains much information on foreign, and especially English affairs; of Montrésor and Fontrailles, both followers of Gaston of Orléans, and the latter the author of a relation of the Cinq Mars conspiracy, short, but minute and striking; of La Châtre, an industrious courtier and intriguer, and a vivid and picturesque writer, whose work, as will presently be mentioned, became entangled in a strange fashion with that of La Rochefoucauld; of the great Turenne, a worthy follower of Montluc and Rohan in the art of military writing, little more than mention can be made. There are some military memoirs of interest, which go under the name of the Duke of York (James II).

Poets — Boileau.

We come now to a great critic, the direct successor of Malherbe, who, perhaps more than any other Frenchman, may be considered as the central literary figure of the seventeenth century — or, at all events, of the long period comprised in the reign of Louis XIV.— Nicolas Boileau Despréaux (1636–1711).

From 1669 until the end of the century Boileau employed himself, now and again, in the composition of elaborate and poetical *Epîtres* to his friends — letters embodying sound literary and social judgments, them-

selves to a certain extent satirical, and preferred by many subsequent critics to his earlier *Satires*. Greater still as a work of art, and ranked by Voltaire as even superior to Horace's famous Epistle *ad Pisones*, was the *Art Poétique*, published in 1673. His *Lutrin*, a heroi-comic poem, was the production of Boileau's full maturity, and in it his ease of versification and polish of expression are most distinctly illustrated. In addition to these poetical works, Boileau wrote, in excellent prose, a free translation of Longinus' treatise *On the Sublime*, as well as critical reflections on that author, several important dissertations, and other minor scattered pieces.

No French critic's name stands as high as that of Boileau, and deservedly; for it is impossible to read his works — or at all events his literary judgments — without admitting his power and refinement. Great force of language, honesty of purpose, delicate raillery, elegance of diction, accurate allegory, and often subtle flattery, distinguish Boileau's style, whilst his character stands out favorably amongst the men who surrounded him.

Racine.

The genius of Jean Racine (1639–1699) was no doubt of a far higher order than Boileau's, but his worldly career had much in common with that of the great satirist and critic. The intimate friendship of Boileau and Racine was more than ordinarily significant; it sanctions their juxtaposition in the pages of a literary chronicle, being, indeed, only the outward demonstration of their sympathy of taste and judgment, and of the influence which they exerted upon each other. The first drama by which the poet challenged the appreciation of his fellow-countrymen was the *Thébaide*, published in his twenty-fifth year, in which the rivalry of the two brothers Eteocles and Polynices is described. It was succeeded by *Alexandré*, another tragedy elegantly written, which was very successful, although it was also distinctly modelled after one of Corneille's. This play wants action.

Andromaque, which was Racine's next tragedy, gave ample evidence of the groove in which his dramatic genius was going to run. It may be fairly said that *Andromaque*, in spite of its faults, and it has many, is the most living, the most Shakspearian of all Racine's tragedies. Others are more perfect in diction, have a more interesting plot, a more elegant versification, but in this play one may imagine he can see the soul breathing under the mask of the stage personages, and can hear passion vibrating in the very lines they speak.

Racine followed next the precedent of Corneille, and tempted the comic muse, by publishing, in 1668, an excellent farce, *Les Plaideurs*, after the manner of Aristophanes. In Racine's next tragedy, *Britannicus* (1669), the rivalry between Nero and Britannicus for the love of Junia are faithfully and poetically delineated, and Agrippina Burrhus, and Narcissus are described as Tacitus has depicted them; the two latter representing virtue and vice struggling to obtain possession of the mind of the youthful emperor, and the freedman finally triumphing and poisoning Britannicus by command of Nero.

Bérénice (1670), which was undertaken at the suggestion of Henrietta of England, in rivalry with Corneille, depicts the struggle of Titus to sacrifice his ambition to his love for *Bérénice*, and his secret rivalry with Antiochus. This piece was a great success, and had forty representations; a very considerable number for those days. In spite of its elegant versification, this tragedy is rather lackadaisical and affected; there are a very few natural sayings placed in the mouth of the different personages, and the grandiloquent style often mars what might have been said more simply and effectually.

Bajazet, represented two years later, suffers from the same fault as *Bérénice*.

One year after *Bajazet* was represented, *Mithridate*, of which the subject is nearly the same as that of Molière's *Miser*, an aged father being the rival of his son:

Phèdre was brought out in 1677. It turns upon the passion of Phædra, the wife of Theseus, king of Athens, for her stepson Hippolytus, who, in his turn, loves Aricia.

In 1689 he published *Esther*, a tragedy taken from the Bible, modified according to the taste of the court.

His next tragedy, *Athalie*, is based upon the eleventh chapter of the second book of Kings. From that time up to the present it has been generally considered as the masterpiece of Racine, and most literary men agree with this opinion, although, as we have intimated, the palm may be justly given to *Andromaque*.

Minor Poets.

By Corneille first, and by Molière and Racine in quick succession, French tragedy and comedy had been almost simultaneously created and brought to perfection. There remained, as a complimentary dramatic achievement of the age of the *Grand Monarque*, the creation of the opera. Quinault (1635–1688) gave the opera to his generation. Whilst, however, his earlier dramatic efforts, with the exception of a passable comedy, *La Mère Coquette*, are now rarely read, the best of his operas, *Armide* and *Atys* in particular, still boast of numerous admirers. The force of Quinault lies, it must be confessed, in his easy versification and musical ear; he would have made an excellent librettist in the nineteenth century — and, perhaps, we could not hit upon a better measure of his talent. In connection with his friend Lulli, a Florentine attracted to Versailles by the munificence of the king, he founded the *Académie royale de Musique*, in the year 1672.

A minor poet of the same age, was Brébeuf (1618–1661), the translator of Lucan's *Pharsalia*, in which both the defects and the merits of the original are represented with remarkable fidelity. Boileau, who found fault with his *fatras obscur*, allowed him frequent flashes of genius, and these flashes are rather more frequent than might be supposed, being also of a kind which Boileau was not usually inclined to recognize. Brébeuf is decidedly of what might be called the right school of French poets, though he is one of the least of that school. His minor poetry displays the same characteristics as his translation, but is of less importance. Madame Deshoulières, still more unjustly criticised by Boileau, is unquestionably one of the chief poetesses of France; indeed, with Louise Labé, and Marceline Desbordes Valmore, she is almost the only one of importance. Her poems, like those of most of her contemporaries, are of the occasional order, and have too much in them that is artificial, but frequently also they have real pathos and occasionally not a little vigor. "Le Songe" is a very admirable ode, having some of the characteristics of the English Caroline school.

Anthony Hamilton has left some verses (notably an exquisite song beginning "Celle qu'adore mon cœur n'est ni brune ni blonde"), as dainty and original as his prose. At the end of the century, two poets, whose names always occur together in literary history, the Abbé de Chaulieu and the Marquis de la Fare, close the record. They were not only alike in their literary work, but were personal friends, and not the worst of Chaulieu's pieces, is an elegy on La Fare, whom, though the older man of the two, he survived. They were both members of the libertine society of the Temple, over which the Duke de Vendôme presided, and which, somewhat later, formed Voltaire. The verses of both were strictly occasional. Chaulieu, like many men of letters of the time, published nothing during his long life, though his poems were known to French society in manuscript. Besides the verses on La Fare, Chaulieu's best poem is, perhaps, that "On a Country Life" (the author being an inveterate inhabitant of towns). La Fare, on the other hand, is best known by his stanzas to Chaulieu on La Paresse.

Bossuet and the Pulpit Orators.

There are some half-a-dozen men of the age of Louis XIV. who, considered by themselves, might

seem to be the natural centre of the literary spirit of the epoch, to neglect whom were to leave all the rest in darkness, and to consider whom in an exhaustive manner were to discharge more than half the duty of the historian. If Bossuet is not one of these, he is at all events one of the intellectual giants of his day, one of the pivots on which the intellectual history of France must ever turn.

It is chiefly by his sermons, and especially by his funeral sermons, that Bossuet will always be known, although his *Discourse on Universal History* is one of the few contributions which the seventeenth century has made to historical literature in France. In his ardent and magnificent eloquence Bossuet undoubtedly lays claim to be considered the pride and model of Christian rhetoric.

A disciple at once of Bossuet and of Balzac — yet a man of whom Fénelon could say, when he heard of his death, that he had lost his master — was Esprit Fléchier (1632–1710). He pronounced fine funeral orations and wrote the *Life of Theodosius*. The most famous of Fléchier's discourses are those on Madame de Montausier (the heroine of the *Guirlande de Julie* and the idol of the Hôtel de Rambouillet), that on Madame de Montausier's husband, and that on Turenne. Jean Mascaron (1634–1703) is chiefly remembered for his *Oraison* on that same death of Turenne which gave occasion to so many orators. He is usually reproached with a certain affectation of style, and there is justice in the reproach. Another great pulpit orator was Bourdaloue, who has been aptly described by Maury as "one of the finest and best of Bossuet's works." Bourdaloue (1632–1704) was in fact something more than a creation of the master-preacher of the age; he vied with him closely both in his success with his hearers and in his estimation by posterity.

Philosophical Moralists.

Another religious writer of the age of Bossuet, more distinctly than he a disciple of Descartes, a thinker rather than an orator, a metaphysician rather than a preacher, was Nicolas Malebranche (1631–1715), born at Paris, and a father of the Oratory from an early age to the day of his death. M. Victor Cousin speaks of his "angelic style," and indeed the works of Malebranche are distinguished by an elegance and a charm which amply account for the favour in which they have always been held. As a philosopher he holds a place midway between Bossuet and Spinoza; with all the unwavering faith of the first, and much of the courageous speculation of the second. His *Research after Truth*, published in 1674, is a candid and laborious disquisition into the causes of human error, in the manner of Descartes, although without the latter's breadth of view or boldness of inference. Amongst the best of Malebranche's remaining works are a volume of *Metaphysical Conversations*, a *Treatise on Nature and Grace*, *Discussions on Metaphysics and Religion*, and a *Treatise on the Love of God*.

Side by side with this Christian philosopher is Jean de la Bruyère (1646–1696). At the beginning of the year 1688 he published a transalation of the *Characters* of Theophrastus, from the Greek, to which he prefixed a short essay on his original, and to which he added his own *Characters or Morals of the Age*, observations on the society amidst which he lived, inserted under the name of an ancient author, who was less acute and less complete and elaborate than La Bruyère himself. His style was good, but it was not in the grand manner of Bossuet, Fléchier, and Malebranche.

Yet La Bruyère knew the secret of his art, and it is only in external form and rhetorical polish that his style can be placed second to that of Bossuet and Bourdaloue.

Decline of the age of Louis XIV — Fenelon.

Amongst the men who laboured to rescue their country from its sorry plight at the beginning of the eighteenth century, the one with whom we have most to do was François de Salignac de la Motte Fénelon (1651–1715), a native of Querci. He wrote, early in life, a number of *Dialogues on Eloquence*, not published until after his death; and a *Treatise on the Existence of God*. His *Treatise on the Education of Girls* was written to assist the Duchess de Beauvilliers in the training of her daughters. The *Treatise on the Ministry of Pastors* was a defence of the apostolic succession of the ministry. His *Fables* and *Dialogues of the Dead*, written after his appointment, in 1689, as the tutor of the young Duke of Burgundy, were composed expressly for his pupil. But the work by which Fénelon is most widely known outside the pale of political history is his prose-epic *Telemachus*, also composed mainly on behalf of his pupil, and not published until after the archbishop's exile from the court, in 1699, and then only through the faithlessness of a servant.

Massillon.

A pulpit orator of the eighteenth rather than of the seventeenth century was another of the noble spirits cherished and ripened in the seclusion of the Oratory, which he entered in his nineteenth year: another instance of the precocious talent so amply manifested in the sacred annals of his time. Jean Baptiste Massillon (1663–1742) stands out, during the later years of his life, like the last great rock in a boiling sea of scepticism and immorality, strong in the simple grandeur of his incorruptibility, firm in his resistance to a flood which had overwhelmed so many of his contemporaries and of his cloth. Massillon effected by pathos, indignation, or exhortation, what Bourdaloue had effected by force of logic and declamation; and his eloquence has been extolled by some of his fellow-countrymen above that of his great predecessors in the pulpit. His style is pure, nervous, and goes straight to the heart; his manly courage adds to it a conviction which we shall seek in vain in the words of men not thoroughly genuine or straightforward. He has been called Voltaire and others, the very first of French orators, and a model of accomplished eloquence. In addition to his sermons Massillon wrote *Panegyrics of the Saints*, *Ecclesiastical Conferences*, considered by Maury his best work, *Paraphrases of the Psalms*, *Synodal Discourses*, and *Episcopal Charges*.

The example of the three great preachers — Bossuet, Bourdaloue, and Massillon — raised up many imitators, some of whom, such as De la Rue, Cheminais, and others, were popular in their day.

Madame de la Mothe-Guyon (1648–1717) is a notable figure in the later decades of the seventeenth century. She became the Mère Angelique of a sort of amorous mysticism only less pronounced than the exaggerated quietism of the Spaniard Molinos. She wrote more than one work, but her *Short and Easy Méans of Praying with the Heart* establishes the principle which underlies her philosophy of religion.

Charles de Saint-Evremond (1613–1703), a nonagenarian, who took part in nearly the whole literary activity of the seventeenth century, and who yet died inspired with the riper ideas of the eighteenth century, was at once a classical scholar, a commentator, a critic, a moralist, and a historian. Amongst Saint-Evremond's best known productions, which are read to this day, we may mention his *Parallel between Turenne and Condé*, his *Reflections on the Varied Genius of the Roman People*, *Reflections on Tragedy, and Comedy*, *Observations on Sallust and Tacitus*, and *a Discourse on Belles Lettres*.

Writers on Memoirs.

The political and social history of the latter part of the reign of Louis XIV. and of the regency is illustrated by the works of a number of writers of memoirs, more or less interesting and valuable for the light which they throw on the decline of France, and on its causes. Of these the most considerable, both for their revelations and for their literary style, are the *Memoirs* of Louis de Rouvroi, Duke de Saint-Simon (1675–1755).

Another court-chronicler was Philippe de Courcillon, Marquis de Dangeau (1638–1720). The Marquis wrote a *Journal*, which contains everything that was done at court from 1684 until 1720, and gives a very minute though faithful picture of the life and doings of the *Grand Monarque* and his family.

The memoirs of Charles Perrault (1628–1703) end where Saint-Simon begins; he died in the third year of the eighteenth century, and his *Illustrious Men of the age of Louis XIV.* deals only with those who had earned notoriety before Saint-Simon attained his majority. Perrault, however, is best known to fame as the author of *Fairy Tales*, most entertainingly written.

Literature of the Refugees.

Pierre Bayle (1647–1706) and Pierre Jurieu (1637–1713) were amongst the first of the religious *émigrés* who settled in Holland, having together sought a refuge in Rotterdam, upon the enforced closing of the Academy at Sedan in 1681. Bayle wrote several philosophical and religious works of marked ability. Among them was *Thoughts Concerning a Comet*, and the *General Criticism of the history of Calvinism*, written in the course of a fortnight. This was a rejoinder to Maimbourg's *History of Calvinism*, wherein the Jesuit had expended a great deal of satire upon the reformed religion, but which drew down upon himself a castigation from the master-critic. A more important work was a serial publication entitled *Tidings from the Republic of Letters*, printed in Amsterdam, somewhat upon the plan of the *Journal des Savants*, which de Sallo had commenced in Paris in the year 1665. Each number consisted of extracts and literary judgments, arranged with considerable taste for what was virtually a first attempt, and which is of inestimable value for the history of contemporary European literature. The English Royal Society invited him to maintain a correspondence with them, at the same time referring to "the superior tact and high talent of M. Bayle for philosophy."

The revocation of the Edict of Nantes struck hard beyond the boundaries of France. The same persecution which filled Holland with refugees, which drained the life-blood from the unhappy land, preparing the way gradually and surely for the inundation of indifferentism and immorality whereby France was presently overwhelmed, which drove into England many of its best and noblest children (amongst others the ancestors of Richard Chenevix Trench and Harriet Martineau), made itself bitterly felt by many of those who, like Bayle, had not waited to be expatriated by force.

Bayle solaced the bitterness of his heart by writing a pamphlet full of indignation and solemn warnings, under the title "*What France wholly Catholic under Louis the Great really is;* and he followed it up by another: *A Philosophical Commentary on the saying of Jesus Christ—'Compel them to come in,' wherein is proved by various demonstrative arguments that there is nothing more abominable than to make conversions by force; and wherein are refuted all the sophisms of forcible converters, as well as the apology for persecutions made by Saint Augustine;* translated from the English of Mr. Briggs, by M. J. F. Canterbury, 1686."

The *Philosophical Commentary* made a great stir, and its Socinianism displeased Jurieu and others of the Protestants as much as the authorities of the Orthodox Church.

The most famous of the learned exiles were at this time assembled in the Low Countries. Besides Bayle and Jurieu, Rotterdam possessed Basnage, Dubosc, and de Superville; Claude, Jaquelot, and La Placette were at The Hague; Le Clerc was at Amsterdam. Of those who clung most jealously to the reformed faith, Jurieu was generally regarded as the mouthpiece and the champion; and he deemed it his duty to protest vigorously against the excessive liberty of thought and expression claimed by Bayle.

But the chief fame of Bayle rests upon his well known *Historical and Critical Dictionary*, which is identified with his name, and which, though by no means the first encyclopædia of modern times (for Alsten, Moreri, Hoffmann, and others had preceded him within the century), was by far the most influential and most original yet produced. It appeared in 1696.

Bayle's style is not by any means a model. But it is lively, clear, and interesting, and no doubt had a good deal to do with the vast popularity of his book in the eighteenth century. Bayle had a strong influence on Voltaire, and though he had less to do with his follower's style than Saint Evremond and Pascal, he is nearer to him in spirit than either. The difference perhaps may be said to be that Bayle's pleasure in negative criticism is almost purely intellectual. There is but little in him of the half-childish mischievousness which distinguishes Voltaire. The scepticism of which Bayle was the exponent was purely critical and intellectual. He was not in the least an enemy of the moral system of Christianity, nor even, it would appear, an enemy to Christianity itself. But his intellect was constitutionally disposed to see the objections to all things rather than the arguments in their favour, and to take a pleasure in stating these objections.

Jurieu (1637–1713) aimed at being the Bossuet of the Protestant Church, and was indeed possessed of almost equal oratorical power with the great Catholic divine. He wrote a *Commentary on the Apocalypse* (1686). In 1638–9 he issued at Rotterdam *The Sighs of Enslaved France Aspiring to be Free*, a famous series of pamphlets attributed to Levassor, an Oratorian who had become a Protestant. M. Henri Martin says of these pamphlets that they are "a singular medley of liberal aspirations and retrograde tendencies towards an imperfectly appreciated past, and are especially characterized by that hatred of modern political and administrative unity which Boulainvilliers and Saint-Simon were about to express with so much energy." The close of his life was disturbed by his quarrel with Bayle, who, as we have seen inclined to free thought in religious matters, declared boldly against theological constraint.

Jacques Basnage (1653–1723), a clergyman, a diplomatist and moralist, of an ancient family, and of about the same order of excellence to which Jurieu belonged as a Protestant pulpit orator, wrote a treatise on *Conscience*, more admired in his own age than read by succeeding ones; but the greater portion of his time and talent was given to a *History of the Jews*, and to a *History of the United Provinces*. Posterity has accorded a greater value to Jean le Clerc's (1657–1736) *Bibliothèques;* the careful and laborious notes of a learned bookworm, whose life was passed in omnivorous reading and deliberate reproduction. Such a man ought to live forever, in order that five centuries of daily work might evolve a shelf-full of commentaries, to serve as a store-house for future generations. Le Clerc was a traveller, who, born at Geneva, visited England, France and Holland; and in a volume of *Discourses on Various questions of Theology* he shows himself an earnest champion of free opinion and expression. His *Life of Richelieu* is severe, even beyond what is just, but for the work of an exiled Protestant upon an absolutist minister of France it is remarkable for its candor and freedom from prejudice.

Exiled Protestant Pastors.

Amongst the preachers of the Reformation who ministered to the church of the refugees, Pierre Dubosc (1623–1692) and Jean Claude (1619–1687) were conspicuous. Claude even more than Jurieu, was the Bossuet of the exiled Protestant communion. Unwavering in faith, ready in resource, lofty and influential in his personal character, he was looked up to by his companions as the strength and ornament of their church; and he knew well how to maintain the dignity of the persecuted faith. If Dubosc was less learned, he was not less impressive and dignified. His style of oratory was simply homiletic, less adorned but more pastoral than the scholarly eloquence of Claude. His *Complaints of the Protestants cruelly oppressed in the Kingdom of France* are worth reading even now, to show what means were employed by the *Grand Monarque* to convert his stubborn Huguenot subjects to the Roman Catholic faith, and to remind us what "moral suasion" meant in those days.

Daniel de Superville (born in 1657) came to Rotterdam in 1685, a young minister whom the *dragonnades* had driven from Poitou. He had been summoned to Versailles, and every effort was vainly made to induce him to recant; but he preferred expatriation to the most splendid temptations of the court. His reputation as a pulpit orator was above the average; and in this respect he was little, if at all, behind Claude and Dubosc. When William III of England visited The Hague in 1691, it was de Superville who was chosen to preach before him.

De Superville was a Cartesian by training, and his sermons of doctrine and commentary are conceived in a strictly philosophical vein; a fact which has earned for them much consideration amongst the most learned critics and theologians.

The most eloquent of all the Protestant pulpit orators, as some maintain, the renowned preacher among the exiles, was Jacques Saurin (1677–1730). His life extends far into the eighteenth century, but the fame of his preaching was at its height before the death of Louis XIV during the last and most disastrous of that monarch's wanton struggles against the liberty and independence of his neighbors. He secured an early reputation for oratory, and shortly after he had been consecrated to the ministry he was invited to, and accepted the charge of, the French Protestant Church in London, being then in his twenty-fourth year. Abbadie heard him preach in the English metropolis, and was so struck by his manner that he exclaimed: "Is it a man or an angel?" London, however, did not keep him long. He soon removed to Holland and continued to live there the remainder of his life. Five volumes of his sermons attest the high quality, the variety, and the practicalness of his style. These are amongst his subjects: *Divine Depths, Alms, The Sufficiency of Revelation, Fitful Devotions, The Torments of Hell, The Misfortunes of Europe, The Cost of the Soul, The Harmony of Religion and Politics, How to Study Religion, Love of Country, Holiness, Conversation.* His eloquence was calm, solid, perhaps heavy—but it was powerful and impressive. If he was rarely a great writer, he was always a great preacher; if he had not the polish of Bossuet, the sparkling brilliancy of Bourdaloue, the elegance of the orators accustomed to preach be-

fore the court in Paris, he had the trenchant vigor most suitable to Protestant homiletics, the pointed vehemence necessary to find its way to the hearts of the downcast exiles who were his usual audience.

In Prussia, the Princess Sophia Charlotte, the mother of Frederick William, the first king of Prussia, showed special favor to the French refugees, being ably seconded by the scholarly diplomatist Spanheim. The House of Brandenburg, which counted such scholars as Leibnitz among its friends and counsellors, emulated Louis XIV in the eagerness and generosity with which it assembled the most celebrated men of the day, whether Prussians or foreigners, and extended its protection over the cultivators of science and literature. At Berlin it established a French College, at Halle a French Institute, which subsequently ripened into a famous University. At Berlin, too, was founded under royal auspices a French printing-press and library, to which the refugees had free access at all times. Every week Spanheim received some literary friends at his own house, where Abbadie, Lenfant, Beausobre, Chauvin, David Ancillon, and others were regular attendants. At the residence of Sophia Charlotte, at the castle of Lutzenburg, the exiles were yet more welcome. Jacques Abbadie, invited to Berlin at an early age, was ordained there in 1680, and became minister of the French Protestant Church; the special friendship of the princess was not the only reward of his ability and eloquence. His *Treatise on the Truth of the Christian Religion* extorted even extravagant praise from Roman Catholics. Bussy-Rabutin writes to Madame de Sévigné: "We are now reading it, and we find that there is but this book to read in the world." The hyperbole pleased his correspondent, who rejoined: "It is the most divine of all books; this is the general opinion. I do not believe religion has ever been spoken of as by this man." And Madame de Sévigné undertakes to read it once in every three months of her life. This much-lauded work, which, though ingenious and persuasive in its style, is really not the marvel of argument that one might suppose from such overdrawn estimates. This was succeeded in a few years by a *Treatise on the Divinity of Jesus Christ*, virtually a continuation of the first. Then followed *The Art of Self-Knowledge*.

Lenfant (1661–1728) and Beausobre (1659–1738) were more distinctly historians than theologians and metaphysicians. The one has left a monument of his laborious enterprise in a *History of the Council of Basle, and of the Council of Constance;* the other in his *History of the Manicheans*, whereof the latter especially is yet read with satisfaction, and has not been displaced in our libraries by any better or more philosophic treatment of the same phase of ecclesiastical history.

Fettering of the Press.

Louis XIV has often been arraigned at the bar of posterity, and the verdict of history upon his reign and acts will never be other than unfavorable; but the literary historian, at any rate, can afford to do him justice. His faults are too many to suffer his virtues to be forgotten. The great fault of his home policy was to suppose that he could crush heresy, free thought, revolt of ideas and action, without a fatal suppression of natural forces which must eventually break forth and overwhelm either himself or his successors. He did in fact stifle all divergence of opinion in France, or at all events the free expression thereof;—with what consequences the remainder of our literary survey must show. The method and manner of this suppression are amongst the most interesting topics of the political history of the epoch; let us rest ourselves for a moment in order to inquire in what way the literature of the same epoch resisted and rebelled against the effort to thwart its wider development. In order that a book or pamphlet might be published, the permission of the chancellor had first to be obtained; and those who wrote, printed, published or distributed any work attacking religion or the government, were put to death. Amongst the duties of the lieutenant-general of police, setting aside the maintenance of public order in the streets, none was more important, or required greater tact in its exercise, than the repression of pamphlets and publications of any kind which might be obnoxious to the Court, the authorities, the Church or the University.

In 1683 Louis authorized La Reynie to proceed against "several ecclesiastics and booksellers who were concerned in the composition of various defamatory writings and libels, containing maxims contrary to the well-being of the administration, and the quiet of the king's subjects, and attacking the honour of divers persons occupying positions of dignity." Two of the persons here referred to, one of them being almoner of the Hôtel-Dieu, were condemned to the galleys. Another of the accused was Lenoble, author of the *Labors of Hercules:* of whose punishment, if any, the records do not speak. In 1686 a new edict was published, whereby the number of booksellers was limited to twenty-four, and seventy-nine royal *censeurs* were appointed; of whom ten were for theology, eleven for jurisprudence, twelve for medical and physical sciences, eight for mathematics, thirty-six for history and literature and two for the fine arts. But as the censors did not prevent the spread of obnoxious books, worse penalties were inflicted under the rule of La Reynie. In 1694 appeared a pamphlet, *The Apparition of Scarron to Madame de Maintenon, and the Reproaches which he cast upon her concerning her amours.* At the end of the same year a certain Chavance was tortured on the rack by the lieutenant-general, and, after accusing some monks of instigating his work, was condemned to be hanged. A printer and a bookbinder were also put to the ordinary and extraordinary torture, and hanged, for having printed, bound and sold libels against the king, amongst others the *Apparition.* Two accused were sent to the galleys. A fifth, after having been tortured, was going to be hanged, when his execution was put off, because he was said to be a distant relative of the king's confessor, La Chaise. All these severities, however, did not prevent the appearance of pamphlets from time to time, more or less grievously offending the monarch and his court; some of which were printed secretly in France, under various devices, for the purpose of concealment and avoidance of punishments and penalties, whilst others were printed in foreign countries, in Holland especially, and privately introduced into France.

We give the titles of a few of these pamphlets: *Le Nouveau Turcq des chrétiens; L'Alcoran de Louis XIV; Les Soupirs de la France esclave; Les Héros de la France sortant de la barque à Caron à l'Esprit de Luxembourg; Luxembourg apparu à Louis XIV; La Confession réciproque, dialogue entre Louis XIV et le P. de la Chaise; Pensées Morales de Louis XIV; Le Marquis de Louvois sur la sellette; Julien l'apostat; l'Art d'assassiner les Rois enseigné par les Jésuites; Le Partage du Lion de la fable, vérifié par le roi;* and *Moyen de réduire la France à un etat plus chrétien.* With the exception of the first pamphlet, which appeared in 1683, all were published between 1689 and 1700. The *Caractères* and *Nouveaux caractères de la famille royale*, brought out in 1702 and 1703, and the *Entrelien entre Louis XIV et la Marquise de Maintenon*, published in 1710, are more bitter and scurrilous than the earlier pamphlets.

From 1660 to 1750, eight hundred and sixty-nine authors, printers, booksellers, venders of engravings and prints, were thrown into the Bastille, as having published works contrary to morals, religion or the king. They generally belonged to the latter category. But all this was bootless. In vain the police became more lynx-eyed; in vain the number of informers increased, death-warrants and condemnations to the galleys multiplied. Louis would not learn the lesson that it is impossible to gag the irrepressible; and his successors paid dearly for the experience that the feelings of a nation will vent themselves in writing or in action, and that the latter is, perhaps, the more dangerous.

From the End of the Reign of Louis XIV Till the End of the Reign of Louis Philippe—The Forerunners of the Revolution—The Transition Authors.

The reaction which overspread France after the death of Louis XIV, which altered the whole aspect of her literary and social annals, and which, after more than half a century of gradual intensification and accumulation of force, brought to birth the cataclysm of the Revolution, was, of course, not entirely due to the influences of the *Grand Monarque*, nor even to the absolutist principles of Richelieu and his successors. These, no doubt, had done much to aggravate the evils which afflicted France during the seventeenth century, and to stimulate the causes which brought about the social revolt of the eighteenth century. Louis and his ministers between them had ruined the country. They exhausted the sap of life by which alone a country can exist wholesomely, and develop healthfully; and the glory and grandeur of the Augustan age had virtually involved the misery and degradation of the age of Terror. An absolute king, a sumptuous court, and an extravagant administration had only one possible counterpart in an oppressed and exhausted populace; it was an inexorable law of history that this should be the case, but it was a law which the philosophy of history alone would reveal, and this philosophy had not been mastered by those who were responsible for its violation.

The spirit which, in the time of Louis XIV, was timidly and furtively expressed, assumed a clearer and bolder form under the Regency, and in the reign of Louis XV. The first note of extravagance and revolt was made perceptible in the domain of morals; religion, phylosophy, literary style, were all to sink one by one under the influence of the new emancipation of heart and intellect before the political fabric was attacked. The moral corruption of society sprang directly from the artificial development of manners and taste which characterized the epoch whereof Louis XIV was the central figure; and here as in every great national movement in which the spirit of a nation is mainly engaged, literature plays the part, not only of an historical exponent, but also of a director and of a cause. The abbé de Chaulieu (1639–1720) is an apt instance of this moral recrudescence in its literary development. He caught the spirit of it, possibly enough, from Molière's friend Chapelle, and he began the Gaul *narquois* of Parisian society, even in the most polished epoch of

the Augustan age, even in the most conventionally correct decades of the seventeenth century. Belonging to the school of Marot, holding both the religion of others and his own philosophy lightly, attracted by the glare and glitter of sensuous enjoyment, he was yet an epicurean rather by taste and coquetry than in act and practical devotion; not himself immoral so much as the cause and the apologist of the excess of others. His intimate friend, the Marquis de la Fare (1644–1712), author of a meritorious volume of *Memoirs*, which show that he had the instinct of a genuine historian, unresistingly passed the boundary line which Chaulieu had marked out, and did not hesitate to vaunt himself "*de grege Epicuri.*"

Of these pioneers of the new age, Jean-Baptiste Rousseau (1670–1741) was another, with still better claim to our attention than Chaulieu and La Fare. His name, if not his individuality, connects the epoch of Louis XIV with the epoch of the Revolution; for Jean-Jacques Rousseau, the author of *Emile* and the *Contrat Social*, who displayed the spirit of his namesake in another form, was one of the principal apostles, though not absolutely a participator, of the great popular upheaval which brought the last century to a close. Jean-Baptiste Rousseau was a poet, with the gifts of harmony and satire, a lyric poet in an essentially prosaic age, without much genius or originality, or even feeling, but with an instinct which made his verses eminently suggestive, and a shrewdness of perception which gave his satire considerable effect, reckless both in his life and in his writings, and destitute of the prudence which enabled many another roysterer of his time to steer clear of public scandal, he too easily fell a victim to the enemies whom his bitter epigrams had made for him. One of these was La Motte, who had conceived the notable idea of compressing *The Iliad* into twelve books; although his knowledge of Greek was at most not greater than that of Pope. Rousseau covered the abortive work with ridicule, and La Motte never forgave him.

Whatever may be thought of the morality of Jean-Baptiste Rousseau, and in spite of his failure as a dramatist, the poet's taste, in the art of versification particularly, is not to be disputed. Human sympathy, on the other hand, has a good deal to do with the development of the poetic faculty; and of this Rousseau had but little.

A couple of poetasters who are wont to be bracketed together for much the same reasons which cause the associations of Chaulieu and La Fare — their personal friendship, and the similarity of their spirit and tendency — illustrate yet more clearly the period of transition from Louis XIV to the Revolution. Preserving much of the mannerism, the narrowness, the timidity of the later Augustan age, Fontenelle (1657–1757) and La Motte (1672–1731) have also much of the instinct for liberty which, in the eighteenth century betrayed its presence under so many different forms of development. If their traditions and powers were all of the past, their ideas and aspirations belonged, in great measure, to the future; and it was courage, not disposition, which retarded their advance. The like thing is true of Chaulieu and La Fare, and of Jean-Baptiste Rousseau, though in a less degree; they dared not embrace the future which tempted them to turn their backs upon the past; it was a natural shrinking which affected the whole generation, until Voltaire had shown them an example of his courage. Poor Fontenelle was the butt of all the clever men in Paris during the first half-century of his life. His uncles, Pierre and Thomas Corneille, encouraged him to write plays; and he wrote two, *Aspar* and *Idalie*, which covered him with ridicule. Racine, more merciful than the uncles, laughed at Fontenelle's attempts; and the latter had little more success with his *Dialogues of the Dead*, and his *Letters of the Chevalier d'Her*. . . . He took next to popularizing science, and wrote a volume of *Conversations on the Plurality of Worlds*, and a *History of Oracles*, wherein he managed to catch the ear of the public. Popular science was thenceforth his rôle. With hardly diminished powers Fontenelle achieved an age not often paralleled in literary history, though his contemporary, Saint Aulaire, a minor poet, nearly equalled it. He died in his hundredth year, and almost at the end of it, his long life extending from the very earliest glories of the Siècle de Louis XIV to the very hottest period of the Encyclopædist battle. La Motte was a much younger man than Fontenelle, and he died more than thirty years before him, but during the first thirty years of the century the pair exercised a kind of joint sovereignty in the Belles Lettres. They revived the quarrel of the ancients and moderns, inclining to the modern side. But La Motte's translation of Homer, or rather his adaptation (for he omitted about half), is not of a nature to inspire much confidence in his ability to judge the matter, though his essays and letters on the subject are triumphs of ingenious word-fence. Unlike Fontenelle, La Motte had one considerable dramatic success with the pathetic subject of *Inès de Castro*, and his fables are not devoid of merit. It was, however, as a prose writer of the occasional kind, and especially as a paradoxical essayist, that he earned and deserved most fame, his prose style being superior to Fontenelle's own.

Destouches (1680–1754), who had been secretary of the French embassy in London, reached a still higher level in his comedies of character, in which, for that age at least, he attained a place second only to Molière. The *Boaster* (*le Glorieux*), the *Philosopher Married*, and the *Spendthrift*, display real genius,—not indeed the genius of a powerful comedian, but that of a playwright always ready and able to please, and not seldom rising to the dignity of creative force. The leading dramatist in the tragic vein, during the generation which succeeded the death of Racine, who like his greater predecessors clung to the classic models for his inspiration, was Prosper Jolyot de Crébillon (1674–1762), author of *Electra*, *Xerxes*, *Idomeneus*, *Atreus and Thyestes*, and one or two other plays. Over the well-worn subjects of Greek mythology he cast the shadow and the glare of a morbidly tragic mind, which pursued and gibbeted sin with the zeal of a fury, and burned its impressions upon the hearts of the spectators by the sheer force of the horror which his pictures inspired. Therein, do doubt, was art and genius, if not of a very refined order. Better than most of his dramas is *Rhadamistus and Zenobia*, which might entitle him to be the Ford of the French stage, provided we deny him just that superiority of style which is generally to be accorded to the Frenchman over the Englishman in comparing two authors of similar spirit and tendency.

Le Sage (1668–1747), best known out of France as the author of *Gil Blas* and *The Devil on two Sticks* (*Le Diable boiteux*), was a satirical dramatist of no mean power; and, as a matter of fact, the success of his second comedy, *Turcaret* (1709), was too great to allow him to prosecute it further in the same direction. This play was aimed against the financiers, who, towards the end of the reign of Louis XIV, wished to make money at any price, and whom Le Sage had studied when he was clerk to one of them. They certainly afforded ample material for satire, and Le Sage ridiculed them to some purpose, and with greater bitterness than he generally uses. They had sufficient influence and spite to make the dramatist perceive that the weapon which he had employed was too effective for his own peace of mind; and he cast it aside for that which he had already made use of in *The Devil on two Sticks*. The veteran Boileau had been no more tender towards this manifestation of the sterner spirit of the new age than he had been towards the vigorous *début* of Crébillon; and his unfavorable criticism may explain why Le Sage attempted a different *genre* from that which had earned him his first great success. He now, however, returned to fiction, and produced his master-piece in *Gil Blas de Santillane*, a vivid picture of manners, an apotheosis of the indifferent worldling, to whom neither virtue nor trickery is in itself commendable or the contrary, but to whom the pursuit of happiness, and success in that pursuit, constitute the aim and end of existence. The book, it has been shrewdly said, is as moral as experience; it is also as useful and as entertaining; and this very fidelity to experience is a cause why it has never lost its popularity. There is an art of purely describing what is not pure; and Le Sage possessed this art in the highest degree. He is, moreover, fresh and simple in style; his charm is not easily described, but it is the charm of all great and simple writers, and of French writers in particular. He touches the evils of his time lightly, but always on the weak spot; he glances past the graver questions of the day, but wherever his glance rests, there it illumines, suggests, and convicts. As Hamlet is the incarnation of human hesitation, Gil Blas is the portrait of plodding humanity; he loses no time, and expends no happiness, upon meditation on the future existence of man; he considers that earthly affairs are quite enough for him to cope with; and, to alter slightly Figaro's saying, he prefers to laugh at human weaknesses rather than to weep over them. The first two volumes of *Gil Blas* were published in 1715, the very year in which Louis XIV died, the third in 1724, and the last in 1735, twenty years after the first two, and eleven years after the third. Le Sage also produced about sixty farces, parodies and opéra-comiques for the minor theatres, of which a few may even be read at the present time with pleasure.

Beyond all doubt, however, the most remarkable, if not the best dramatist of the late eighteenth century is Beaumarchais (1732–1799). Some critics have seen in the enormous success of the *Barbier de Séville*, 1775, and the *Mariage de Figaro*, 1784, nothing but a *succès de circonstance* connected with the political ideas which were then fermenting in men's minds. This seems to be unjust, or rather it is unjust not to recognise something very like genius in the manner in which the author has succeeded in shaping his subject, without choosing a specially political one, so as to produce the effect acknowledged. The wit of these two plays, moreover, is indisputable. But it may be allowed that Beaumarchais' other productions are inferior, and that his *Mémoires*, which are not dramatic at all, contain as much wit as the Figaro plays. As a satirist of society and a contributor of illustrations to history, Beaumarchais must always hold a very high place, higher perhaps than as an artist in literature. Of his life, it is enough to say that he was born in 1731; became music master to the daughters of Louis XV; engaged in a law suit-

the subject of the *Mémoires*, with some high legal functionaries; made a fortune by speculating and by contracts in the American war, and lost it by further speculations, one of which was the preparation of a sumptuous edition of Voltaire. Besides the Figaro plays, his chief dramatic works are *Eugénie*, *Les Deux Amis*, and lastly, *La Mère Coupable*, in which the characters of his two famous works reappeared. After Beaumarchais, but few comic authors demand mention. Fabre d'Eglantine, the Companion of Danton and Camille Desmoulins on the scaffold, is better remembered for his death than for his life. But his *Intrigue Epistolaire* and *Philinte de Molière* show talent. *Le Sourd*, by Desforges, is an amusing play.

Later Port-Royalists.

The school of the Port-Royalists was not yet extinct, though Jansenism had fallen into disfavour, and was the object of persecution. Charles Rollin (1661–1741) was one of the later disciples of Pascal and Arnauld, and he suffered for his fidelity. The son of a cutler in Paris, he received an excellent education at the university, of which he subsequently became a professor, after which he was made principal of the college at Beauvais. A year or two before the death of Louis XIV, he was driven from his post, and thenceforth devoted himself to authorship. He published an edition of the *Institutes of Quintilian*, and afterwards a learned *Treatise on Studies*, which has been highly praised by critics as competent as Villemain (1790–1867), who calls it one of the best written of French works after the productions of men of genius. Rollin was a man of ability rather than of genius; and as a historian his talent is displayed in the highest possible form. His *Ancient History* and his *History of Rome* (continued from the date of the battle of Actium by his pupil Crévier), are still consulted and admired, even after the labours of many more illustrious successors. His historical talent was exemplified especially in the care which he devoted to the collation and accurate citation of ancient authorities; and he deserves the eulogy which Montesquieu has passed upon him, as "the bee of France." His piety, his learning, and his simplicity, gained for Rollin a high repute amongst his contemporaries, which posterity has jealously guarded for him.

Louis Racine (1692–1763), a Jansenist like his master, does credit to the care bestowed on him by Rollin, and brings no discredit upon the great name which he had inherited. He was another of the younger generation whom Boileau delighted to snub; but in spite of the old man's discouragement —for he counselled him never to write in verse — Louis Racine left behind him a number of *Sacred Odes*, various minor poems, and two didactic pieces on *Grace* and *Religion*, of indifferent but not insignificant merit. He was, moreover, a German scholar in an age when the German language was understood by few foreigners; and he made an abortive attempt to translate Milton's *Paradise Lost*.

Daguesseau (1668–1751), another Port-Royalist of the eighteenth century, *avocat-général*, and afterwards *procureur-général* to the Parliament of Paris, an orator, a jurisconsult, a statesman, and a moralist, was the author of several works of much dignity and worth, which added a lustre to his name and generation, though they are less read in our day than in his own. His writings were, indeed, especially suited to his contemporaries, by the graver of whom he was held in high esteem, though his stern and upright character rendered him obnoxious to men like Philip of Orléans, Cardinal Dubois, and their sycophants.

Montesquieu, the Social Innovator.

In no one of the new generation of Frenchmen who came prominently forward soon after the death of Louis XIV, had these ideas taken such deep root, by none were they better understood or more clearly enunciated, than by Charles de Secondat, baron de Montesquieu (1689–1755). His *Persian Letters* (1721) glow with the spirit of the age; his great aim, born of the reaction against tyranny in general, and against the absolute monarchy in particular, was to destroy the idea of despotism, and to elevate the idea of human individual freedom. He was not a Rousseau in rashness, a Voltaire in vehemence, because he was an aristocrat by birth and education, because he clung to the traditions and the hopes of a constitutional monarchy, because he was an optimist by temperament, even if he inclined to be a democrat by conviction. He took a pride in drawing up his genealogy, of which he had every reason to be proud; but, in compensation, it was he who naturalised the term *citoyen*, in place of the discredited "subject" — a term which, from the moment of its rehabilitation, at once assumed dynamic force, and took its place in language and history as a monument of the destruction, at least in idea, of the old disgraceful relation of tyrant and victim. During the period elapsing between the appearance of the *Persian Letters* and the completion of the *Spirit of the Laws* (1748), Montesquieu waited, in common with the rest of France, for the realisation of the hopes which had been placed in Louis XV, "the well-beloved." No sooner had the illusion vanished; no sooner did it appear that to-day was to be as yesterday, and that the new king was unwilling or unable to remove the burdens imposed by his predecessors, than the temper and the intellect of the nation instinctively turned round and settled down to the task which was thenceforth seen to be inevitable. The Revolution was decreed; the people made its declaration of independence; and Montesquieu was its first, and perhaps its most effective mouthpiece. He was in his thirty-second year when the *Persian Letters* were published; and though they bore no name upon the title-page, they at once secured success and influence.

All the weaknesses of France in political, ecclesiastical, and social arrangements are here touched on with a light but sure hand, and the example is thus set of attacking "les grands sujets." From a literary point of view the form of this work is at least as remarkable as the matter. Voltaire himself is nowhere more witty, while Montesquieu has over his rival the indefinable but unquestionable advantage of writing more like a gentleman. There is no single book in which the admirable capacity of the French language for jesting treatment of serious subjects is better shown than in the *Lettres Persanes*. Montesquieu's next important work was of a very different character. The *Considérations sur les Causes de la Grandeur et de la Décadence des Romains* is an entirely serious work. It does not as yet exhibit the magnificent breadth of view and the inexhaustible fertility of explanation which distinguish the *Esprit des Lois*, but it has been regarded as a kind of preliminary exercise for great work. The style of the *Grandeur et Décadence* is as grave and dignified as that of the *Lettres Persanes* is lively and malicious. But his masterpiece is the *Spirit of the Laws*, published a few years before his death, in 1748, of which Voltaire, not a specially favorable critic of Montesquieu, and who persisted in classifying him with the age of Louis XIV, says: "The human race had lost its titles: Montesquieu has recovered and restored them to it." The eulogy is deserved and it was not without justifiable pride that the author himself wrote in his preface: "When I saw what so many great men in France, in England, and in Germany, had written before me, I was buried in admiration: but I did not lose courage. I said with Correggio, 'I also am a painter.'" It is sometimes a little too sententious in tone, and suffers from the habit, induced probably by *Pensée*-writing, of composing in very brief paragraphs. But it is an excellent example of its kind, and especially remarkable for the extreme clearness and lucidity with which the march and sequence of events in the gross is exhibited. The *Esprit des Lois* is, however, a far greater book than either of these, and far more original.

Montesquieu begins by considering laws in general, and the varying character of laws as they proceed from different modes of government; and in this examination he is guided by the conviction that law-makers "have not been governed solely by their caprices." He discovers a harmony amongst the laws of each nation, and even amongst the principles which have regulated the laws of different nations. Every law is found to be connected with all the rest, and to depend on some other wider and more general law; and it is only by throwing himself into the current of a nation's history, and by considering it esoterically, that he is able in all cases to discover this connection and inter-dependence. He discusses the principle of democracy, aristocracy, and monarchy, and their bearings on education, on positive law, on social conditions, on military strength, offensive and defensive, on individual liberty, on taxation and finance. Then an abrupt return is made from the effects to the causes of constitutions and polity. The theory of the influence of physical conditions, and especially of climate, on political and social institutions — a theory which is perhaps more than any other identified with the book — receives special attention, and a somewhat disproportionate space is given to the question of slavery. The strength of Montesquieu's work resides, perhaps, rather in its implications than in the actual deductions of the author. Its weakness has been considered, at all events by many of his own countrymen, to consist in the fact that he rests satisfied with historical analysis, and that, whilst his own bias is clearly towards popular sovereignty, he abstains from saying that full political rights can only be secured by popular sovereignty.

The Political Economists.

A work like that of Montesquieu is of the few which invariably create a school. The *Spirit of the Laws* formed a school of upright statesmen and political economists — the school of Turgot (1727–1781) and Quesnay, of Malesherbes and Necker. The first of these, a sound and deliberate rather than a brilliant writer, an ambitious and generous rather than a successful politician, has been aptly called the l'Hôpital of the eighteenth century. After serving his country for some time in the comparatively inconspicuous capacity of intendant of the *généralité* of Limoges — a post which he refused to quit for more lucrative ones at Rouen and Ly-

ons—he was appointed by Maurepas, at the instance of his friend the Abbé de Véri—minister of marine (1774), and shortly afterwards controller general of the finances. It was one of those acts which so often, in the eighteenth century, gave true patriots a momentary gleam of hope that wiser counsels would be allowed to prevail in the government; for Turgot was already known, not only in the literary world but in the world of politics, as an honest, bold, and able man. In his youth he had raised his voice in the interests of the still-persecuted Protestants. His economical articles in the *Encyclopædia* had brought him into prominent notice about the time of Montesquieu's death, and had fixed upon him the hopes of thousands of his fellow-countrymen. He had to wait long before he attained the object of his honorable ambition; but it was not in his destiny, nor in the destiny of France, that he should be allowed to rescue the nation. We have called Turgot a disciple of the school of Montesquieu. He was a disciple also of Quesnay (1694–1774), a learned physician, whose bold but somewhat crude work on political economy had inspired him, as it inspired many others of his contemporaries, with some of his best ideas. Quesnay was a worthy pioneer of that school of political economy, which considers the tiller of the ground as the principal column of the social edifice—a science called by Quesnay's disciple Dupont de Memours *physiocratie*—and which contributed almost as much as the metaphysical school to the intellectual regeneration of France.

Amidst the crowd of innovators by whom our attention now begins to be distracted, of course utopists make themselves more or less prominent; and of these Bernardin de Saint-Pierre (1737–1814) was one of the most philanthropic and the most impracticable. Attracted by the doctrines of Rousseau, he settled in Paris as a man of letters, where, from the age of forty until close upon his death, he published a large number of works, of great variety and of considerable charm of style: a *Voyage to the Ile-de-France*, *Studies on Nature*, *The Indian Cottage*, *The Harmonies of Nature*, and, most popular and charming of them all, *Paul and Virginia* (1787). His art was to paint in words; and he employed it, as a faithful student of nature, more successfully than any of his contemporaries. He conceived plans which, if they could be carried out, might undoubtedly abolish the greater part of human sorrow; for he always extolled humanity, tolerance, and the absolute sway of justice, and endeavored to show that man can only be happy upon this earth by labor.

Voltaire.

Victor Hugo warns us against Voltaire as "that ape of a genius sent as the devil's missionary to man."

De Maistre says very much the same thing (1694–1778). Others have described him as an idiot, an unclean imbecile, a *drôle*, a *franche canaille*, and the like.

It is now over a hundred years since his death, and the definite judgment of posterity has scarcely yet been passed upon François-Marie-Arouet de Voltaire. His long life was a series of literary activities and successes, which left behind it, in the opinion of some, the greatest reputation gained by any French intellect of the eighteenth century, and, in the opinion of others, as we have seen, the greatest reproach which it is possible to conceive. Born as ugly as Pope, as sickly as Pascal, his genius burned from the first with remarkable brightness in its apparently frail tenement. He ate little, slept little, drank little but black coffee, and of that very much, and yet cheated death of his expectations for eighty-four years, as full of hard work and mental excitement as any of his contemporaries. On leaving college he fell into the most dissolute society in Paris; was twice banished from home by his father; and once ran away from the house of a *procureur* with whom M. Arouet had placed him, and lived for some little time in Holland. On his return to Paris, where he was appreciated and esteemed by men of fashion as well as of letters, he earned fame at the age of twenty-four, by his earliest venture, the poetic tragedy of *Œdipus*. It was as a dramatist that he continued to write, with no little success, for many years, producing in quick succession *Artémise*, *Mariamne*, *Brutus*, *The Death of Cæsar*, *Mérope*, and a dozen other tragedies, together with half-a-dozen comedies of inferior merit. Whilst in England, our author published in English an *Essay on Epic Poetry*, destined to serve as an introduction to the *Henriade*, and an *Essay upon the Civil Wars of France extracted from curious manuscripts*. Both works were afterwards translated into French, though the latter was forbidden to be published in France.

His strictly historical work afterwards was indeed considerable, even if what is perhaps the most remarkable of it, the *Essai sur les Mœurs* (which may be described as a treatise, with instances, on the philosophy of history, as applied to modern times), be excluded. Besides smaller works, the histories of Charles XII and Peter the Great, the *Age of Louis XIV*, the *Age of Louis XV*, and the *Annals of the Empire*, belong to the class of which we are now treating. Of these there is no doubt that the *Siècle de Louis Quatorze*, 1752, is the best, though the slighter sketches of Charles, 1731, and Peter, 1759, are not undeserving of the position they have long held as little masterpieces. Voltaire, however, was not altogether well qualified for a historian; indeed, he had but few qualifications for the work, except his mastery of a clear, light, and lively style. He had no real conception, such as Montesquieu had, of the philosophy of history, or of the operation of general causes. His reading, though extensive, was desultory and uncritical, and he constantly fell into the most grotesque blunders. His prejudices were very strong, and he is more responsible than any other single person for the absurd and ignorant disdain of the middle ages, which, so long as it lasted, made comprehension of modern history and society simply impossible, because the origins of both were wilfully ignored. These various drawbacks had perhaps less influence on the *Siècle de Louis Quatorze* than on any other of his historical works, and it is accordingly the best.

Voltaire produced an immense quantity of miscellaneous work, tales in verse, epistles in verse, discourses in verse, satires, epigrams, *vers de société* of every possible kind. These are almost invariably distinguished by the felicity of expression—spoilt only by too close adherence to the mannerism of the time—the brilliant wit, the keen observation which are identified with the name of Voltaire. The number and the small individual size of these works make it impossible to particularise them here. But *Le Pauvre Diable* may be specified as an almost unique example of easy Horatian satire less conventional than most of its kind; and the verses to the Princess Ulrique of Prussia as a model of artificial but exquisitely polished gallantry in verse.

The significance of such a man in his generation, and his influence upon the generations which succeeded him, cannot easily be overrated. His boast that he had done more in his time than Luther and Calvin was in one sense true enough; though indeed Luther and Calvin were amongst his own intellectual creators. His effect upon his age was as immeasurable as his activity; and it would be hard to set any limit to the authority exercised by Voltaire upon the France of the eighteenth century, which was so soon after his death to translate his opinions into acts. We can only state in a summary way that Voltaire as a philosopher was no metaphysician; but he was a firm and convinced Deist: see his *La loi Naturelle*, a bitter enemy of all sorts of fanaticism, and what he thought to be Christianity; an ardent champion of tolerance, and a strenuous defender of the notion of an innate feeling of justice.

The Encyclopædists.

The object of an encyclopædia is to collect the erudition scattered over the face of the world, to expound its general system to the men with whom we live, and to hand it down to the men who shall come after us; so that the labours of past ages may not have been useless labours for the ages which succeed, that our descendants, becoming better informed, may at the same time become more virtuous and more happy, and that we may not die without having deserved well of the human race. Such were the words of those who, about the middle of the eighteenth century, conceived the idea of the *Encyclopædia; a methodical* (*raisonné*) "*Dictionary of the Sciences, Arts, and Trades.*" A Parisian publisher, desiring to have a translation of Chambers's *Cyclopædia* (published 1728), applied to a young and comparatively unknown man, Denis Diderot (1713–1784), to perform the labour. Diderot, full of spirit and ambition, was not satisfied with the dry and limited English work, and conceived the plan of one which should be somewhat similar in design, but vaster and more comprehensive. He opened his idea to d'Alembert (1717–1783), young like himself, but already well known as a mathematician, who looked favourably on the scheme; and together they set themselves to the task. In 1746 they obtained their license to print; Diderot drew up the prospectus, d'Alembert wrote the plan of the work. Large numbers of subscribers supported an idea which promised to reflect such great credit on the nation and the age. Many of the best writers of the day tendered assistance; Voltaire wrote several of the articles; Montesquieu and Buffon co-operated with the young editors; Malesherbes and Turgot lent their aid. Even the Jesuits, and the few Jansenists who still existed, offered to share in the toil; but their help was politely declined. It would have been well if those responsible for the contents of the *Encyclopædia* had exercised discrimination amongst their friends as well as amongst their enemies; for the articles are very unequal, some of them being at once weak and declamatory—such, for instance, as the abbé Mallet's *Hell*, the effort of writing which, it has been maliciously said of him, he was not able to survive. Diderot, the editor, seems to be apologising for this unevenness in his own article, "Encyclopædia," when he says that such a work "could only be attempted in a philosophical age, because it demands throughout more boldness of spirit than one usually has in the pusillanimous ages of Taste." In religion, a compromise was apparently made with orthodoxy; or, at all events, the religious articles are written with the same freedom on the orthodox side as on that of innovation. In philosophy,

the English modern authorities are most in favour, Locke and Newton being preferred to Descartes; for Condillac had followed Voltaire in familiarising Frenchmen with the ideas of their neighbours. In the history of philosophy Diderot was himself the principal spokesman, until Voltaire came to his assistance after his return from Berlin; and he contrived, skilfully enough, to compensate for the freedom accorded to the literary abbés who wrote about religion. In politics, Diderot and his associates were of the school inaugurated by the *Spirit of Laws*, only still more pronounced than Montesquieu in favor of popular sovereignty. In science, which d'Alembert made his peculiar care, the Encyclopædists were severely scientific, at the same time that they were clear and accurate, the articles on scientific subjects being copiously illustrated by woodcuts. In literature, Marmontel, Mallet, de Jaucourt, Dumarsais, and others, wrote according to their lights; that is, with little originality and no great spirit. The science of literary criticism was not yet mastered; and, if we except the grammatical articles of the last named and of Beauzée, the technical contributions of the *Encyclopædia* to the history and method of letters were inconsiderable.

The opposition of those whose mouthpiece Chaumeix had made himself caused the revocation of the permission to publish the gigantic work which was issued to the public. After a suspension of six years, between 1759 and 1765, it was continued, and brought to a conclusion in 1771; although a supplement of half-a-dozen volumes appeared six years later. Diderot had to bear the brunt of the objections and jealousies which were aroused by the *Encyclopædia*. Marmontel, Condorcet, Morellet, lived to enter the Academy; Turgot and Malesherbes, after they had become ministers of France, found means to reward several of their former colleagues; but Diderot received no honour or reward for his pains. He wrote two poor dramas, *The Father of the Family* and *The Natural Son*, in which he painted all the sordidness of his own existence; an *Essay on Merit and Virtue*, his first work, which displays the weakness and the enthusiasm of a religious bigot; a *Letter on the Blind*, in which he is completely emancipated, and advocates the opposite side of what he maintained in his first essay, and which procured for him the honour of a sojourn at the castle of Vincennes; and a couple of volumes on the *Exhibitions of Pictures* (*Salons*) strung together in seventeen days for his friend Grimm, one of the most readable of his works. He also published two novels — *Jacques the Fatalist*, a series of tales and conversations between Jacques, his master, and the landlady of a public-house; and *The Nun*, which aims at depicting the evils of nunneries, but with an absolute disregard of common decency. The best work of his later days is an *Essay on the Reigns of Claudius and Nero*, filled with declamations and digressions, and even containing a history of the quarrel between Diderot and Jean Jacques Rousseau; but which is no bad eulogium on Seneca.

D'Alembert (1717–1783), "the man who wrote a preface," according to Gilbert, is known to us by still better titles than the preliminary discourse of the *Encyclopædia*, though that is sufficiently large and philosophic in its views to earn him a reputation. As a mathematician he has left his mark upon his age; as a writer he was, if not brilliant or ornate, at least sound and dignified. Amongst his literary productions, his laborious articles in the *Encyclopædia* should not be omitted. That on *The Court* is marked throughout by a vein of irony, such as enters more or less into the style of most French prose-writers of the eighteenth century when treating of the moribund government and institutions of their country. But this was not the natural or the best style of d'Alembert, who is, above all things, solid, argumentative, and precise. A more characteristic article is the one on *Geneva*, which, amidst an able treatment of the reformed church and of its history, took occasion to suggest that the church of Geneva had, during the past two centuries, gradually deserted the principles of Calvin for those of Servetus, and to advise the republic, in all seriousness, to establish a national theatre, by way of softening the manners of its morose population. The article raised a storm, not only in Switzerland but in France. His essay on the *Destruction of the Jesuits*, and on the *Society of Men of Letters and of the Great*, are both in his best style; the latter being an admirably spirited contribution to what we may perhaps venture to call the literature of literature.

Marmontel (1723–1799), the son of humble parents, to whose sacrifices he owed a liberal education, reaped his first success in the *Académie des Jeux Floraux* at Toulouse. Having gained three prizes for poetry, he sent his verses to Voltaire, who thought well of them and obtained employment for the young man in Paris. In 1748 he wrote *Denys the Tyrant*, a tragedy which was at once accepted. Mademoiselle Gaussin and Mademoiselle Clairon, two of the leading actresses of the time, fought for the rôle of Arétie, daughter of Dion, who reminds the reader of the Æmilia of *Cinna*. The piece succeeded, as did also *Aristomenes;* but *Cleopatra* was laughed off the stage, a fate which also befell the *Heraclides* and the *Funeral of Sesostris*. *Belisarius*, the *Incas*, and the *Moral Tales*, of which the morality is only in the title, are amongst his works, and were at once received into public favour. In 1763, upon the death of Bougainville, he was elected to the Academy. He also produced several operas, amongst others *Dido* and *Zemire and Azor*, and established his reputation as one of the most versatile writers of the century. Marmontel collected also the literary articles which he had published in the *Encyclopædia*, and which appeared as *Elements of Literature;* but there is very little that is either startling, new, or well told to be found in them. Two years before Marmontel's death he wrote a *Memoir*, to plead for the free exercise of the Roman Catholic worship, then forbidden. "Thirty years after the publication of *Belisarius*, Marmontel became the advocate of those who had censured his work. Such an action redeems many faults of style."

The tendency to materialism, if not the actual enunciation of the theory, so manifestly displayed in the writings of Diderot, was still more apparent in those of the less powerful and less eloquent Helvétius (1715–1771), who composed an essay on *Mind*, for the express purpose of proving that matter was the only absolute existence. The transitory success of the book was due principally to the excitement of those who were scandalized by it. Rousseau was on the point of controverting so much of argument as Helvétius had addressed to the support of his thesis, when the Sorbonne unfortunately interfered with its merely *ex cathedrâ* refutation, and he held his hand. Unfortunately, we say; because it would have been interesting to see how the great sentimentalist would have met the reasoning of Helvétius. The latter, and his friend the Baron d'Holbach (1723–1789), from whose house their works were clandestinely issued, denied the necessity of assuming an immaterial force external to the bodily organs of man. Intelligence seemed to them to supply a spring of action sufficient to account for all the phenomena of thought; or at all events no larger assumptions were made in order to bridge over the difficulties of their theory than was needed by those who maintained the existence of something beyond and above matter, and utterly foreign to the domain of human experience.

Condillac (1715-1780) outdid Locke in the distinctness with which he referred all human powers to the influence of sensations upon a mind originally void of ideas. Given a receptive mind, possessing, if not rudimentary faculties, yet at all events consciousness and conceptivity; nothing more was needed, according to Condillac, to explain all the results of the ripened intellect than the innumerable seeds of sensational phenomena, germinating from the very moment of our birth. His followers, it is true, carried his theory beyond the point where he himself left off, and differ in little more than temperament from the cold materialism of d'Holbach.

Another collaborator of d'Alembert and Diderot on the *Encyclopædia* deserves a slight mention, the Marquis de Saint Lambert. He was a favourite with Voltaire, which did not prevent him from ousting the latter out of the affections of Madame du Châtelet. He wrote a descriptive poem on the *Seasons*, after the manner of Thomson, as well as a number of smaller poems and fables, which were praised by his friends, and are now deservedly forgotten.

The Moralists.

Amongst the moralists of the eighteenth century who stood upon the ancient ways, and who continued, or rather ended, the line marked out by Pascal and La Bruyère, was Lucde Clapiers, Marquis de Vauvenargues (1715–1747), born of a noble family of Provence, in the year of Louis XIV's death. Dying at the age of thirty-two, he can hardly be said to have displayed his talents at their ripest, but, for all that, his life was a full one, and he wrote much. Vauvenargues was a literary critic of some acumen, though his judgments are not always such as have been confirmed by posterity. He has left behind him, in addition to his letters, a small volume of *Critical Reflections on Several Poets*, and a number of *Imaginary Conversations* — between Pascal and Fénelon, Charron and Montaigne, Molière and a young man, Racine and Bossuet, and the like. His *Characters*, somewhat after the manner of La Bruyère, no doubt suggested by La Rochefoucauld, though without the latter's heartless cynicism, are piquant and often striking.

Another of the latter moralists, Duclos (1704–1772), though somewhat older than Vauvenargues, was yet in a sense his pupil; for his mind ripened more slowly, and he lived a quarter of a century after the other. His principal work was a volume of *Considerations on the Manners of the Age*, which was translated into English and Dutch during the life of the author. He also wrote a *History of Louis XI*, "a work," according to Daguesseau, "written to-day with the learning of yesterday." Beauzée (1717–1789), who succeeded him at the Academy, pronounced his panegyric in high terms. Rousseau called him *un homme droit et adroit:* D'Alembert declared that he gave utterance to more wit in a certain time than any man he knew; but the present generation merely says that he is just readable, and that he is remarkably unequal both in matter and in style.

A rhetorician and a moralist who partly succeeded in reviving the manner of the Augustan classicism of France, a man who preserved the purity and loftiness of his ideas amidst

the overflowing licence of the eighteenth century, was Antoine Léonard Thomas (1732–1785), who wrote a number of *Eloges* in a style of florid, rather declamatory, and yet elevated eloquence. If he is still read, it is more from curiosity than with zest; for he is a rhetorician pure and simple, and rarely rises to the height of philosophy.

The Revolution — The Orators of the Revolution.

The progress of the French Revolution from its outbreak in 1789 to the close of the century, was marked by a great intellectual and literary activity, well worthy of careful consideration, though neither so striking nor so brilliant in its results as the literature which immediately preceded it. Within the dozen years previous to the meeting of the three estates of the National Assembly, Voltaire, Rousseau, and Buffon had died, and there was no one to take their place. It is true that the nation no longer needed philosophers and poets. These had amply completed their work, and the men of ideas were giving way before the men of action. The philosophers of the eighteenth century had been the pioneers of national emancipation; they had given the *coup de grâce* to every corrupt institution in the country; they had sown the seeds of the evil, as well as of the good, that was destined to usher in a new era; they had created their Frankenstein, and perhaps it was well for them that they should not live to see him at his work. On the other hand, if they had died before the Revolution and the Reign of Terror, they were denied the triumph of witnessing the fulfilment of all their highest and most honorable ambitions.

Men of letters were now to be succeeded by men of speech: eloquence assumes the position hitherto occupied by wielders of the pen. The Constituent and Legislative Assemblies and the Convention bring before us a school of rhetoric which, amidst all its passion and violence, yet manifestly continued the dominant philosophical ideas of the eighteenth century. "In the first, the doctrines of Montesquieu and Voltaire were represented by Mounier (1758–1806), Malouet (1740–1814), Lally-Tollendal (1751–1830); the radical extreme, founded on the principles of the *Contrat Social*, was led by A. de Lameth (1760–1829), Barnave (1761–1793), the abbé Sieyès (1748–1836) and A. Duport (1759–1798), whilst the *ancien régime* found its apologists in Cazalès (1758–1805), and Maury (1746–1817). Above all these towered the figure of the eloquent Mirabeau (1749–1791), who asserted with unique force and superior intelligence the rights of the people. In the Legislative Assembly and in the Convention we find Condorcet (1743–1794), the biographer of Voltaire, Vergniaud (1753–1793), Guadet (1758–1794), Gensonné (1758–1793), disciples of the most impracticable views of Rousseau. The orators of the Convention lead us finally from Danton (1759–1794) to Robespierre (1758–1794) and Marat (1744–1793), beyond the point where a literary record can take cognisance of them."

Republican Pamphleteers.

We have seen how the ideas of the Revolution were translated into words: let us inquire as to the form which they gave. Amongst the many talkers of the Assembly one man stood out as a silent man *par excellence;* and it was of him, the abbé Sieyès (1748–1836), that Mirabeau declared his silence to be a public calamity. But if Sieyès could not or would not speak, he wrote some of the most potent words which proceed from the mouths of his colleagues; and of Mirabeau in particular. As a writer Sieyès was bold, logical, direct between the premiss and the conclusion; as a politician he was circumspect and even timid. One of the few eminent Frenchmen who steered a clear course from the taking of the Bastille to the conferment of dictatorial power upon Napoleon Bonaparte; a man with scarcely an enemy and without a single intimate friend, it was he who first openly maintained that the Third-Estate of France was the French nation — an idea which it is the distinction of Mirabeau to have converted into its political realization.

What is the Third-Estate? Such was the question which Sieyès undertook to answer in a celebrated pamphlet which appeared in 1789. The Third-Estate, according to the abbé, is, or ought to be, or at the very least might be, everything; whereas in France it had hitherto been nothing. It is a complete nation in itself; providing the whole rank and file of the army, of the church, of the law, of the administration, of every profession and trade and branch of industry. It was only from the privileged positions in all these spheres that it had been excluded; but it was capable of supplying worthy candidates for any and every post, however exalted. It could dispense with the rest of the nation, but the rest of the nation could not exist without it. Hence it followed that the lofty position from which it was excluded was its by the highest right, whilst the privileged orders were merely usurpers. Doubtless there had been exceptions. Sieyès admits, but makes light of them.

Sieyés became later on president of the Emperor Napoleon the First's senate, was created count, and died at Paris at the age of eighty-eight years. Wherever he may have drawn the line in his own public actions, he could not draw it for his disciples during the Revolution; and every champion of liberty in France became then his disciple. His treatise did more than anything else to push forward the minds of his countrymen upon the path which had been open before them; there was not a single ardent patriot who did not feel the full effect of the argument so ably expounded.

There were, indeed, many who were ready to speak and to write; and amongst them a fiery, somewhat idealistic, but powerful and courageous advocate of the Republic, Camille Desmoulins (1762–1794); one of the first men of the age who openly urged his compatriots to dispense with the monarchy. Camille Desmoulins wrote two pamphlets, *Philosophy to the French People* and *Free France*, before the meeting of the States-General, whereto the young lawyer had been sent by the electors of Paris, and wherein he acted for some time as Mirabeau's secretary. More a writer than a speaker, he produced between November 28, 1789, and August 15, 1791, a sort of journal of passing events, issued from time to time in fly-sheets, under the title of *Revolutions of France and Brabant*. During the Reign of Terror, himself at last a victim of suspicion and invective, he wrote *The Old Cordelier*, a biting satire in his earlier style, which helped bring him to the scaffold.

Desmoulins, at his best, is wonderfully strong and nervous; his rhetoric is jerky, full of climax, of insistance and accumulation, pouring along in a rapid stream, carrying his reader breathless to the close of his most declamatory passages. Over and over again the paragraphs of his *Free France* read like the dictation of conditions of surrender to a besieged town.

Camille Desmoulins did his best to check the mad rage displayed by the popular leaders in the later phases of the Revolution. He urged the formation of a "Committee of Clemency," as the best means of conciliating parties and putting an end to the public distrust. But he was unable to struggle against the powerful Committee of Public Safety, to whose jealousy and resentment he at length fell a victim. Amongst those who at the same time withstood the excesses of Robespierre (1753–1801), Saint-Just (1754–1792), and their friends, were Fabre d'Eglantine (1759–1794), de Lacroix (1751–1830), and Bourdon de l'Oise (1755–1838).

Royalist Pamphleteers.

Rivarol (1753–1801), who for two years conducted the newspaper *Les Actes des Apôtres* in the interest of the monarchy, and who, unpopular as was his cause, added to his work such a charm of wit and brilliancy as to rival the *Revolutions of France and Brabant*, directed his satire at first and chiefly against Mirabeau; and it is characteristic of the great dislocation of ideas and social ties during the epoch of the Revolution that Mirabeau's brother, nicknamed Mirabeau Tonneau (1754–1792) was amongst the fellow-labourers of Rivarol. He was further assisted by Champcenetz (1759–1794), Lally-Tollendal (1751–1830), the Count de Montlosier (1755–1838), and others of minor note; and the gallant band fought for some time with great vigour and effect for the declining cause of monarchy, whose speedy downfall they were not able to foresee or willing to anticipate. It was, once again, the natural French weapon in the hands of Frenchmen, satire of the most delicate kind, alternating with satire of a kind by no means delicate, irony, *persiflage*, innuendo, suggestion which cut and wounded to the quick, and which was more formidable, and consequently more resented, than the most outrageous invective or the most severe logic.

The first number of the *Acts of the Apostles* consisted of "the Introduction," and was published on the 2d of November, 1789. Mirabeau is here described under the name of Marcel.

Amongst Rivarol's assistants should also be mentioned two lawyers of honest repute and more than respectable ability, whose zeal for king and aristocracy were expressed in elegant phrase, in bold and piquant satire — Suleau (1751–1792) and Bergasse (1750–1832). The former, trained to arms, found the profession of the law more congenial to his tastes, and he has left behind him a worthy memorial of his forensic skill in his *Fidelissimæ Picardorum genti*, or *You sleep, Picard, and Louis is in chains*. He was a somewhat indiscriminate satirist; or at all events he would not refrain from occasionally giving a back-handed blow to his friends. In his ingenious reply to Necker's *Projet d'Observation, a Letter to the King concerning the decree of the Assembly upon Titles, Names, and Armorial Bearings*, contesting the minister's view that Louis would not be wise to resist the Assembly, and to destroy the good understanding between it and the king, Suleau attains the height of polished irony.

Bergasse was opposed to Beaumarchais in the celebrated case of the banker Kornmann. He was a man of substantial ability and influence, who was returned by Lyons to the States-General, and there cast in his lot with "the Right," but quitted the Parliamentary and Constitutional arena as soon as he found that the Assembly was more liberal than himself. He declared his resolution in eloquent and even

convincing terms, which prove everything, except his wisdom in giving up the service of his country.

Chamfort (1741–1794) is hardly a royalist literary man. When the revolution broke out he embraced its principles with enthusiasm, became the literary adviser of Mirabeau, but found out too late that he had no longer a friend left with sufficient money to give him a sumptuous dinner, or wealthy enough to take him out for a drive. He saw then the error of his ways, repented, and was going to be arrested, when he attempted to kill himself, first with a pistol, and then by slashing himself with a razor. His wit, which shines chiefly in his sayings, is that of a misanthropical egotist, for, to quote his own maxim, "in frequenting men the heart must either break or become hardened."

Literature During the Reign of Terror.

The French Revolution had its Adonaïs in André Chénier (1762–1794)—"the young swan who died strangled by its bloody hands," as says H. De Latouche. *Notice sur A. Chénier.*

It was on the 25th of July, 1794 (the seventh Thermidor of the second year of the Republic), that Roucher and André Chénier met their death. The latter, who was then in his thirty-first year, had hardly printed a line, and his poems were only published for the first time in 1819. But amongst his friends he already had a reputation; they had seen much that he had written, and expected great things of him. After commencing and immediately tiring of a military career, he came up to Paris in 1784, and at once found congenial friends in such men as the painter David (1748–1825), the chemist Lavoisier (1743–1794), the poet Lebrun (1729–1807), the critic Palissot and the chevalier de Pange (1764–1796). His ambition was simply to know all that could be known; he had a soul, but not a body equal to the task, even if his fate had smiled on his courage. He was the Chatterton and the Keats of France; but he was at the same time an enthusiast for liberty, and he soon threw himself into the vortex, from which he was only to escape by death. Associating himself with Roucher, de Pange and others, he wrote much in the *Journal de Paris*, which took a bold tone against the tendency to anarchy on the one hand and to aristocratic reaction on the other, which were already clearly manifesting themselves.

His younger brother, Marie-Joseph (1764–1811), was likewise a child of the Revolution; but his ideas were not entirely in harmony with those of André. He became a member of the most violent of the clubs of Paris, the *Friends of the Constitution*, afterwards better known, more powerful, and more sanguinary, under the title of the *Jacobins*, and of which Robespierre was the most notorious leader. But if André was more moderate in his views than the younger brother, he was at least rash in the expression of his own. He extolled Charlotte Corday (1768–1793), the assassin of Murat (1714–1793), he attacked Collot d'Herbois (1750–1796) and Robespierre, and made enemies who only waited their opportunity of revenge. He was more chivalrous still, and, whilst the nobility fled from Paris, he sought and obtained from Malesherbes the task of attending upon the king in his prison. When Louis asked from the Assembly which had condemned him the right of appeal to the people, it was André Chénier who wrote the text of the letter. (See H. De Latouche, *Poésies de André Chénier*, preliminary memoir.) His courage brought him into imminent danger and at length he was persuaded to quit the capital. With Chénier died de Montalembert, de Montmorency, the Baron von Trenck, Loiserolles, Roucher, and others—thirty-eight in all. When the young poet saw his former colleague of the *Journal de Paris*, he cried: "You! the most irreproachable of our citizens! a father, a beloved husband! Are they sacrificing you!" And Roucher in his turn: "You! virtuous youth! They are taking you to death, bright with genius and hope!" "I have done nothing for posterity," sighed Chénier; and then, touching his forehead, he muttered, "Yet I had somewhat there."

Amongst the martyrs of liberty who fell victims to the frenzy of the Parisian mob or of their leaders, and who have a special claim to be mentioned in a literary record of the time, was Jean Sylvain Bailly (1736–1793), a genuine friend of liberty, who longed as ardently as any for the establishment of the new order, and who, avoiding the extremes of either side, incurred danger from both.

It was raining when he was being led to execution. "You tremble, Bailly," said one of the officers. "I tremble, my friend," said Bailly, "but it is because I am cold." As a man of letters he is honourably known as the author of a *History of Astronomy*. Vergniaud (1753–1793), one of the leading spirits of the Girondin party, an orator second in parliamentary eloquence of the higher kind to Mirabeau alone, laboured hard to moderate the passions of the time, and to hold a middle course between the excesses of the Republicans and the reactions of the Royalists. When the September massacres took place there were none who protested more indignantly than the Girondins, than Vergniaud himself, who repeated on many subsequent occasions the fervid declamations by which his oratory is distinguished. Buzot (1760–1794), Gensonné (1758–1793), Gaudet (1758–1794), friends and colleagues of Vergniaud, belonged to the same political party, and took the tone of their eloquence from their leader. Madame Roland was the soul of the Gironde; around her those brilliant and courageous men were wont to gather, in order to discuss the needs and dangers of the country; it was she who stimulated those whom she knew to be fit for action, and urged to the tribune those whom she knew to be eloquent. She perished amidst the slaughter of her party, on the 8th of November, 1793, about four weeks after Marie Antoinette. Both *Memoirs* and correspondence exhibit her as a woman of lofty and punctilious honour, nobly faithful to her husband, who was old enough to be her father, and sincerely attached to her friends, to whom she often showed the softer side of her character in the most charming and natural traits.

The Ultra-Revolutionists.

After the list of the literary victims of the Reign of Terror must come those who, votaries of letters also, were fatally impelled through political fanaticism to sacrifice youthful and promising spirits like André Chénier, who had been given but spare time to produce the riper fruits of their genius. Foremost in the dark group stands the man who represented more completely than any of his associates of the Convention the forces, the austere and cruel features, the quality and the defects of the extraordinary period which brought him to light and fame; Robespierre (1758–1794) the angel, says Louis Blanc, the youngest and most powerful historian of these memorable times; Robespierre the miscreant, writes Michelet, the most poetical but by no means the most impartial exponent of historical truth. It is not within our province to decide whether he was one or the other; some unbiased historian may eventually clear him of undeserved calumny and divest him of extravagant praise.

It was the fate of literary terrorists to acquire their first notoriety by the pen. Jean Paul Marat began by writing, like Robespierre; but he wrote a great deal more than his fellow-member of the Convention, and was known a great deal less, at least before the Revolution. Beside the horrible invitations to massacre which filled the pages of his newspaper, the *Ami du Peuple*, appeared pieces of logic and sound sense that were calculated to attract and move the masses. How far he succeeded is sufficiently well known. The hand of Charlotte Corday brought the publication of the *Ami du Peuple* to a close in 1793. Marat was superior to Hébert (1755–1794), the editor of the newspaper, the *Père Duchesne*, who perished on the scaffold at the hands of Robespierre, and who had Marat's unbridled violence without a particle of his talent.

Saint-Just (1767–1794) and Danton (1759–1794) belonged to another class. Saint-Just studied assiduously in his youth, wrote doggerel verses after leaving school, and being in Paris in 1789 was suddenly fired by revolutionary faith. His essay on the *Spirit of the Revolution* is good in its way. His speeches in the Convention, although imbued with the rather grandiloquent tone which pervade literature and oratory in the time of the Revolution—are eloquent and full of the most ardent patriotism. This young man was an orator and a patriot, and, in spite of his faults, is a representative figure of the Revolutionary era. So was Danton, who, through his magnificent eloquence, the sincerity of his opinion, and the greater kindliness of his nature, can claim a place beside his younger rival.

The End of the Reign of Terror.

The Terror would have yielded much sooner before the outraged conscience of the nation, whom the excesses of its false friends had driven first to despair and then to the verge of a formidable reaction, if it had not been for the valour of the armies of France against her enemies. The foreign wars not only reconciled the country to patience in regard to her internal troubles, but they provided an outlet for the national force and energy which might otherwise have been turned against the fomenters of disorder in the capital; and thus it happened that the liberty of Frenchmen was trodden under foot with impunity.

Amongst the best and wisest measures of the Convention during the later phases of its existence were the establishment of the first Normal School and the foundation of the Institute. The idea of the presiding spirits of the Republic in the course which they thus pursued was similar to that which sought to produce conformity in the national drama, and which would have moulded the general education of the state upon a harmonious and systematic plan.

Literary Men of the Day.

Constantin-François Chassebœuf, count de Volney (1757–1820), was born at Craon, near Mayenne. At the age of

twenty-five he made a voyage eastward, in Asia Minor and on the Nile, and wrote on his return a readable account of his experiences—a *Voyage in Egypt and Syria*; perhaps the best written of his works, if not the best, because he contrives to make his subject more prominent than himself, and skilfully sinks the traveller in the traveller's narrative. In 1789 he was elected member of the States-General, and distinguished himself amongst the supporters of Mirabeau in the National Assembly. Early in 1792 he published his *Ruins; or, Meditations on the Revolutions of Empires*, which met with a great success, and earned him the fame of a philosopher, over and above that of a careful narrator. In this work he discourses upon the revolutions of empires, mingling his meditations upon the causes and circumstances of national decline with sketches, more or less graphic and picturesque, of the material ruins which illustrate the ruin of dynasties and of ideas.

Volney was not merely a sceptic, but a point-blank traverser of religious truth under all its many forms. Human creeds are, with him, universally founded in imposture; it is not enough to say that they are false, but they were falsely imposed. The effect of his meditations and arguments is depressing in the extreme; it would be the more depressing the more they were true. Under the Empire Volney became a senator and a count; and in 1814 he gave to the world his last work, *New Researches in Ancient History*.

The chair of philosophy in the Normal School was filled by Garat (1749–1833), a man who had taken no inconsiderable part in the Revolution, without committing himself to any act of overt violence, but who was nevertheless expelled both from the Senate and the Academy after the restoration. He wrote a volume of *Memoirs of the Revolution, or an Explanation of my Conduct in the Public Service*. This was published in 1794. He afterwards wrote a *Memoir of M. Suard*, into which he introduced more of his recollections and more of his ingenious ideas; but the interest of his books was merely ephemeral.

Necker (1732–1804), a native of Geneva, the able and conscientious minister of Louis XVI, was one of those statesmen and men of letters who were capable of rendering their country good service, at all events in time of peace, but who at an early period lost confidence in the power of the National Assembly to guide the fortunes of France and to control the passions of the multitude. He seems to have earnestly desired the welfare of his adopted country; he endeavoured to save and to reform the old constitution, with the genuine instincts of a conservative mind. His *History of the Revolution*, published in 1796 at Geneva, bears witness on almost every page to the attachment which he felt towards the country which he had endeavoured to govern.

Necker was not alone in his advocacy of, and his efforts to bring about, a reformation of the French constitution. His friend Monnier (1758–1806), the best orator of the States-General, was also a champion of moderation, and showed great courage during his political career. In 1790 he was not listened to, and, like Necker, he deemed it prudent to seek an asylum abroad. He published at Geneva his best work, *Researches into the Causes which have prevented the French from becoming Free*, formed, during his exile, an establishment at Weimar for the education of the young, and only returned to France in 1801. It has been well said of him, that "he was thirsting after justice." So also was Mallet du Pan (1749–1800), a Calvinist born in Geneva, and a genuine lover of liberty without excess. Mallet du Pan's *Considerations on the French Revolution* contain much that is historically valuable, side by side with philosophical ideas of no inconsiderable merit. He was also a journalist of talent, of a lofty independence of mind.

André Morellet (1727–1819) was one of the many Frenchmen who had ardently desired the Revolution, who suffered from its excesses, and who still remained faithful to their convictions. His *Apology for Philosophy against those who charge it with the troubles of the Revolution*, published in 1796, is an able and effective defence of the position of Montesquieu and Turgot.

Count Joseph de Maistre, issued from Neuchâtel in 1796, his *Considerations upon the French Revolution*, in which the most characteristic standpoint is that the French Revolution, in common with all the agitations and operations of mankind, proceeded from a divine order and direction, and by virtue of this sanction alone overcame all obstacles. He resided in Russia no less than fourteen years, and wrote there his *Essay on the Generating Principle of the Constitution*. He maintained ultramontane doctrines in two of his posthumous works, in his *Letters to a Russian Gentleman*, in which he defends the inquisition, and in his *Four Unpublished Chapters on Russia*, in which he opposes the emancipation of the serfs and the too sudden introduction of sciences in Russia. His works are considered paradoxical, but eminently suggestive; his style is nearly always original, lively, and brilliant, though sometimes turgidly rhetorical.

Napoleon Bonaparte (1769–1821) claims a passage in our record with as much right as a mere author of books; for the victories which he achieved over the enemies of his country, and over his country itself, were not won only upon the battle-field. His proclamations and despatches were the work of a man of great mental power, of a man whose words became actions, as his actions inspired enthusiasm. Some of his addresses to his soldiers deserve to be compared with not a few of those recorded by historians of the ancient Greek and Roman generals, and breathe the same spirit of rapine. In his youth Napoleon wrote some *Regulations* for a society of officers of the regiment of La Fère, called *la Calotte* (1788), only remarkable for their extreme democratic tendency; a *Letter to M. Matteo Buttafuoco, Deputy of Corsica at the National Assembly* (1790), in which the deputy is violently attacked on account of his aristocratical tendencies; a *History of Corsica*, in two small volumes, which was rigidly suppressed by the police during the first Empire; and was of no literary value, though it had been stated that Mirabeau said "that it seemed to give promise of a historian of the first rank;" a reply to a subject proposed by the Academy of Lyons in 1789: "*To determine the Truths and the Sentiments which it is the most needful to inculcate in Mankind for its happiness*," and which did not receive the prize; the *Supper at Beaucaire* (1793). What share Napoleon had in writing in St. Helena the *Memoirs to serve for the History of France under the Reign of Napoleon* cannot be known with certainty. They are said to have been dictated by him to the generals Gourgaud and Montholon, who shared his captivity.

The Dramatists of the Empire.

Among these we may merely mention Alexandre Duval (1767–1842), M. Brifant (1781–1857), Jean François Ducis (1783–1816), a man of great independence of character, referred to above as an indefatigable adapter of Shakespeare, the first Frenchman who made a systematic attempt to naturalise the English dramatist in France, had much of the true perception of a dramatic author, and was sincerely anxious to break through the slavish trammels willingly adapted by the devotion of his contemporaries to the used-up models of the classic stage. From 1769 to the close of the century he was engaged in his self-appointed task. *Hamlet*, *Romeo and Juliet*, *King Lear*, *Macbeth*, and *Othello*, followed one another at intervals. He wrote *Abufar, or the Arab Family*, and *Fœdor and Wladimir, or the Siberian Family*, which prove that he had real dramatic force, and much freshness of imagination.

Picard (1769–1828) was one of the best and most fertile producers. A hard-working author, rarely content with less than a dozen hours at his desk in the course of a day and a tolerably shrewd observer of humanity. His best comedies are the *Optimist*, the *Old Bachelor*, and *Castles in the Air* (*Les Châteaux en Espagne*). Collin d'Harleville (1755–1806), who died whilst Picard was comparatively young, wrote less than the latter, and in a less dramatic form.

The stage of the empire had many other dramatists to draw upon. Lemierre (1723–1793), of the old school, wrote several tragedies, of which *Hypermnestra* and the *Widow of Malabar* are considered the best; and Florian (1755–1794), better known by his *Fables*, was the author of *Jeannot and Colin*, the best of his comedies; both died before the Directory. Andrieux (1759–1833), who long survived the Restoration, a journalist and a satirist as well as a dramatist, wrote *Aneximandra*, a lively burlesque which met with considerable success, and the *Blunderers* (*Etourdis*), which is still occasionally acted. Etienne (1778–1845), who wrote a favourite piece called the *Two Sons-in-Law*, and Nepomucène Lemercier (1771–1840), a stickler for the classical fashions, exhaust the list of those whom it is worth our while to notice. Lemercier, a fertile writer, the author of *Pinto* and *Plautus*, boasted that he was the creator of a historical comedy, and added in this style *Christopher Columbus* (1809) and *Richelieu* (1828), the latter being his latest work. He wrote also a number of tragedies, classical and historical, of which *Agamemnon*, written when he was only twenty-six years old, is considered the best. In 1810, shortly after having been elected a member of the Académy, he published a somewhat remarkable poem, the *Atlantead, or the Newtonian Theogony*, in which Oxygen, Caloric, Gravitation, Phosphorus, appear as the divinities of a latter-day theocracy. Nine years later appeared another work, the *Panhypocrisiad, or the Infernal Comedy of the Sixteenth Century*, played, according to the author, before a pit of demons, men and women, in the infernal regions.

Philosophy During the Empire.

Royer-Collard (1763–1845) descended from an old Jansenist family. He was still young when the Revolution broke out, and he adopted the principles of constitutional progress with the enthusiasm of a well-balanced mind. He was an opponent of the philosophy of Locke. Whatever may have been the influence of Royer-Collard upon his generation, his views do not manifest the metaphysical strength necessary to cope with the theories of the great English philosopher.

The primitive legislation of Louis-Gabriel-Ambroise, count de Bonald (1754-1840), marks a distinct development of the intellectual ideas of France during the earlier years of the century, and deserves to be mentioned on this account alone. The scope of the work is ambitious. The fact is that Bonald was too bold, that his generalisation was a little too venturesome, and that his arguments, if carried to their logical conclusion, would destroy all liberty for man, for the state, and for religion.

There must be but a mere mention of the name of Joseph Joubert (1754–1824), a native of Montignac, who left behind him a volume of *Thoughts, Essays, and Maxims*, of which Sainte-Beuve says that no book better crowns the series commenced by the *Thoughts* of Pascal, and continued by La Rochefoucauld, La Bruyère, and Vauvenargues.

The Reign of Louis Phillipe.—The Historians.

After each epoch of unusual activity, and especially activity in civil or international warfare, literature has come to look as a matter of course for the advent of historians of a higher order than the mere writers of memoirs and annals who find their subjects in the commonplace occurrences of every successive generation. The revolutions of empires and dynasties naturally create their own historians. In France no great historian adorned the eighteenth century, whilst the nineteenth has already produced a Thiers, a Guizot, a Michelet, a Thierry, a Henri Martin, a Louis Blanc, and a Mignet. But whilst Thiers, Louis Blanc, Michelet, and Mignet are historians of their own age, the others, manifestly belonging to the same school, and owing the special determination of their faculties to similar causes, have gone back as far as the Merovingians, the Normon invasion of England, and the Renaissance, and abroad as far as England and Germany, for their subjects.

Louis-Adolphe Thiers (1797–1877) has a double right to be placed at the head of the list. His *Histoire de la Révolution Française* appeared between 1823–1827, and brought him much reputation. Admirably systematic from beginning to end, profoundly thought out and lucidly explained, full of perspicacity, of movement, of life, of elevation — no mere dry record, but a brilliant exposition of motives, of underlying theories and principles — the *History of the French Revolution* is a luminous and elegant contribution to historical literature.

The chief fault of Thiers as a historian is his misleading partiality, which is especially displayed in his account of Napoleon's wars, and reaches its climax in that of the battle of Waterloo.

François Mignet (1796), whose public life was closely interwoven with that of his fellow-student, was born at Aix, from whence he removed to Paris at the age of twenty-seven. He also wrote a *History of the French Revolution*, which appeared in 1824, and was received with a favour due to the qualities distinct from those of his friends. His chief later works were on the 'Spanish Succession,' on Mary Stuart, and on Charles the Fifth after his abdication, with, last of all, the rivalry of Charles V and Francis I. Mignet is as trustworthy as Thiers is the reverse. But his historical manner is exceedingly dry, as also is his style, though it is correct and not inelegant.

An older man than either Thiers or Mignet, equally if not more distinguished as a historian, though he did not make his *debut* in this branch of literature until they were already famous, François-Pierre-Guillaume Guizot (1787–1874). The life of Guizot, like the life of Thiers, was constantly divided between the claims of literature and the distraction of public affairs. In 1822, Guizot began to edit the *Memoirs on the History of the English Revolution*, in twenty-six volumes, and *Memoirs relating to the Ancient History of France*, in thirty-one volumes; and, debarred from the lecture-room, he had recourse to the press, wrote articles in the *Globe*, and founded a review, the *Revue Française*, of which a number appeared every two months, and which had a great influence on public opinion. It was not until the year 1827 that he published his first *Course of Modern History;* but it is not to be supposed that his pen was idle during this portion of his life. His *History of the English Revolution* occupied him for many years before his publication in 1826; and amongst the other fruits of a laborious life may be mentioned his *Essay on the History of France*, which was published in 1824. In 1828 the Sorbonne was reopened; and Guizot's second and third course of lectures was delivered on the History of Civilisation in Europe, from the fall of the Roman Empire to the French Revolution; a course which may perhaps be regarded as the most significant monument of the genius of its author. In 1841 Guizot wrote a sketch of Washington, which is not to be compared with the best of his literary productions, although it is held in esteem in the northern states. At the age of eighty-five he brought out a résumé of no great pretension, called a *History of France related to my Grandchildren*, of which the last volume appeared after his death. Sound common sense and laborious acquaintance with facts are his chief characteristics.

Jules Michelet (1798–1874) was one of the earliest and the most distinguished of the historical school, which, professedly or instinctively, adopted the philosophical method of Guizot, and which, not satisfied with the mere recital of facts, however complete the system upon which it might be possible to arrange them, sought in history its more lofty tendencies, its more pregnant lessons, its more brilliant adornments. Born at Paris a year after Thiers, two years after Mignet, he devoted himself from his youth to the study which was to occupy him throughout his long life, making his first attempts on public favour in his *Chronological Tableau of Modern History* and his *Synchronic Tableau of Modern History* published in 1825 and 1826. In 1831 appeared his *Roman History*. In 1833 he published a *Précis of Modern History;* and in the same year he began his voluminous *History of France*, which consumed the best labours of four-and-twenty years, while a *History of the French Revolution* alone took him six years. The *Sources of French Law* was issued in 1837; he also wrote a volume of the *Memoirs of Luther*, and translated the *Principles of the Philosophy of History* from *la Scienza Nuova* of Vico. His principal work *The History of France*, has not been concluded; and several volumes of it appeared after his death. He also devoted himself for two or three years to natural history, and wrote treatises of no little originality on *Birds*, *Insects*, *The Sea*, and many other heterogeneous subjects.

The style of Michelet is sparkling, full of breadth and vigour, of fire and originality. The richness of the thoughts seems to clog the pen of the writer, so that his language becomes nervous and even turgid; but the brightness of his pictures, the abundance of his ideas, charm the reader more than any mere evenness and elegance of form.

Augustin Thierry (1795–1856) falls not far short of the genius of Guizot and Michelet; and indeed, in his style, as in his historical scope, he occupies an intermediate position between these two — approaching both at their best, excelling both in certain of his own higher qualities, and yet without the special strength which has earned for them their highest fame. After a specially distinguished course at college and university, he gave himself entirely to historical pursuits from the age of twenty; and ten years of arduous and unremitting toil resulted in the complete loss of eyesight in 1826. One of his best-known works, the *History of the Norman Conquest in England*, had appeared in the preceding year; whilst in the year following he gave to the world his *Letters on French History*. His affliction seemed only to nerve him to greater efforts. *Ten Years of Historical Studies* appeared in 1840; *Narratives of the Merovingian Times* six years later; a *Collection of the Monuments of the History of the Third-Estate* (of which the first volume appeared in 1849, the other two later); and an *Essay on the Rise and Progress of the Third-Estate*, in 1853. The *Collection* occupied him during seven years, and was only brought to a close by his death in 1856. We may judge of the spirit with which Thierry pursued his labours by a noble and pathetic self-allusion, which he did not hesitate to insert in the preface of his *Ten Years of Historical Studies:* "Blind and suffering, without hope and almost without respite, I can bear this testimony which, coming from me, will not be suspected. There is in the world something better than material enjoyments, better than fortune, better even than health, and that is devotion to science."

After having written for four years in the Liberal newspaper *Le Bon Sens*, he founded in 1839 *The Review of Progress*, and published the year following his well-known treatise on the *Organisation of Labour*. The year after that appeared *The History of Ten Years*.

Louis Blanc has also written a *History of the French Revolution* (1847), an enthralling subject for Frenchmen, which, in addition to himself, Thiers, Mignet, and Michelet, occupied the labours of Droz (1773–1850) and de Lamartine (1790–1869). The latter, however, has received more credit for his *History of the Girondins* (1847), a topic eminently suited to his personal dispositions and predilections.

We can do no more than mention the remaining historians of this period: Henri Martin (1810), the writer of a remarkably full and trustworthy *History of France*, in seventeen bulky volumes, invaluable to the student, and which has often been put under contribution for this History of French Literature; Amédée Thierry (1797), author of a *History of the Gauls;* de Vaulabelle (1799), author of a *History of the Two Restorations;* Duruy (1811), who confined himself to the history of Ancient Rome and Greece; Sainte-Beuve (1804–1869), whom we shall encounter further on, but whose *History of Port-Royal* exacts for him a mention in the present chapter; and A de Tocqueville (1805–1859), rather a philosopher than a historian, whose works on *Democracy in America* and *The Old-Régime and the Revolution* must be classed amongst the most valuable historical monuments of the nineteenth century.

The Poets of the Romantic School.

Victor Marie Hugo was born at Besançon on the 28th of February, 1802. At the age of fourteen he wrote a drama,

Artamène, to celebrate the accession of Louis XVIII, and in the following year he obtained an *accessit* for a poem on the *Advantages of Study*, in competition for a prize of the Academy. His *Odes et Poésies Diverses* appeared in 1822, when he was twenty, and were followed two years afterwards by a fresh collection. In these poems, though great strength and beauty of diction are apparent, nothing that can be called distinct innovation appears. It is otherwise with the *Odes et Ballades* of 1826, and the *Orientales* of 1829. Here the Romantic challenge is definitely thrown down. The subjects are taken by preference from times and countries which the classical tradition had regarded as barbarous. The metres and rhythm are studiously broken, varied, and irregular; the language has the utmost possible glow of colour as opposed to the cold correctness of classical poetry, the completest disdain of conventional periphrasis, the boldest reliance on exotic terms and daring neologisms. Two romances in prose, more fantastic in subject and audacious in treatment than the wildest of the *Orientales*, had preceded the latter. The first, *Hand d' Islande*, was published anonymously in 1823. It handled with much extravagance, but with extraordinary force and picturesqueness, the adventures of a bandit in Norway. The second, *Bug Jargal*, an earlier form of which had already appeared in the *Conservateur*, was published in 1826. Amongst his poems, published subsequently to those already mentioned, are the *Songs of Twilight* (1835), *Rays and Shadows* (1840), *Inner Voices*, *The Chastisements* (1853), *Contemplations* (1856), *The Legend of Centuries* (1859), of which the second part has just appeared, the *Song of the Streets and of the Woods* (1865), and *The Terrible Year* (1872). *Rays and Shadows*, written five years later, contains some of Victor Hugo's most brilliant feats of versification; but already the poet's thoughts are becoming more serious. In all these lyrics, excepting perhaps those portions of *Odes and Ballads* that refer to politics, and especially to Napoleon, there is not a discordant, not a jarring note; whoever can understand poetry finds there treasures of pure poetic feeling. Had Victor Hugo merely confined himself to art pure and simple he would still be the greatest of French lyric poets. But his talent is many-sided, and in romance and in the drama he has left, as in lyric poetry, indelible traces. We shall refer to him hereafter as novelist and dramatist.

After Victor Hugo, we naturally turn to Alphonse de Lamartine. In 1820 he published his first volume of poetry, the *Poetical Meditations*, which met with a great and deserved success. They are original, elegant in form, and filled with partly religious, partly melancholy thoughts, which at that time had the charm of novelty. The *Ode to Manoel* and the *Ode to Bonald* were admired by all true lovers of lyric poetry; whilst the rising generation fell into enthusiasm over such harmonious elegies as *Isolation*, the *Vale*, the *Autumn*, and, above all, over the *Lake*, which has been called "a work of unhoped-for perfection, a profound and limpid union, an image found once, and recognized by all hearts." A few years afterwards appeared the *Poetical and Religious Harmonies*, which, though admired by many, seem rather diffuse. After the July Revolution, de Lamartine went to the East, and one year after his return published (1835) in prose, his *Remembrances, Impressions, Thoughts, and Landscapes during a Voyage in the East*, in which splendid descriptions often take the place of accuracy and observation. This was followed by *Jocelyn*, a poem. In 1838 appeared another poem, *The Fall of an Angel*, crowded with the strangest fancies, and the most gigantic and eccentric comparisons, which contains also some, but not many, beauties of the first order. His last poems, the *Poetical Musings*, want that spirit and elegance which distinguished his earlier verse. M. de Lamartine has also written several tales in prose, edited two monthly reviews, *The Counsellor of the People* (1849–1852), and *The Civiliser* (1852–1856), and published during several years a *Familiar Course of Literature*, which, begun in 1856, had a legitimate and well-deserved success. His tragedy in verse, *Toussaint Louverture*, met with little favour when it was played in 1850.

Alfred, Count de Vigny (1799–1863), was born three years before Victor Hugo, and was, like the latter, a romancist, a dramatist, and a poet. In 1822 appeared his first *Poems;* two years later a so-called passion play, *Eloa, or the Sister of the Angels*. The same year which saw the production of *Cinq Mars* brought to light also his first volume of verse, *Poems Ancient and Modern* (1826), in which "The Deluge," "Moses," and "Florida" were much admired. *The Destinies* and *A Poet's Journal* were published after his death in 1864. One of the sweetest and best of his poems is "The Horn," a reminiscence of the tradition of Roland and Charlemagne, will give but the beginning and the end.

The youngest of the poets of the romantic school was Alfred de Musset (1810–1857), and he was also the first who succumbed to death. He, too, was a dramatist and a novelist; and he left behind him the *Confession of a Child of the Age*, written in his twenty-seventh year, which recalls in some sort the *Confessions* of Rousseau, and in a few of its passages is as filthily realistic. There was in him something of the agile, loose, adorably impertinent. Like the teasing gnat of la Fontaine, his happiness was in making the old classic lions fume learnedly. Manifold, invulnerable, he copied now the fresh attractiveness of Mathurin Regnier (*don Paez*), now the passion of Faust (*The Cup and the Lips*), sometimes the glowing pictures of *Parisina*, *Lara*, *The Corsair* (*Portia*), more frequently the epic zigzags of *Don Juan* (*Namouna*); whilst, a rival of Marivaux, he brought to the *Théâtre Francais* his delightful *Caprices*. His *Ballad to the Moon*, a parody of the romantic school, was, in its time, sung all over Paris. De Musset's earliest production was a volume of poems, the *Tales of Spain and Italy* (1830). Perhaps his masterpiece in verse is *Rolla*, which appeared in 1835 in the columns of the *Revue des Deux Mondes;* though the *Nights*, which followed soon after, contain, as do also his minor poems, many passages of exquisite beauty, which have secured to him a more than ephemeral fame.

Undoubtedly the most brilliant exponent of satirical poetry after the Revolution of 1830 was Auguste Barbier (1805). Some men make revolutions, but of Barbier it may be said that the Revolution made him. It inspired him with vengeful strains full of wild patriotism, that have only been equalled by some portions of Victor Hugo's *Chastisements*. One should read *Les Jambes* to realise to what height of savage grandeur the French language can rise. These poems were published separately in 1830 in the *Revue de Paris;* the most conspicuous for beauty of form are *La Curée*, *L'Emeute*, and *La Popularité*. These satires, admirable in style as well as magnificent in inspiration, were immediately recognised as the work of a great poet. Unfortunately Auguste Barbier did not justify the hopes raised by this striking *debut;* his second publication, *Il Pianto*, is not comparable to *Les Jambes*. It may be that Barbier was unadapted for any other style of poetry than satire.

Sainte-Beuve, who is chiefly known as a literary critic, and whom we shall meet in that capacity anon, wrote some poems, *Consolations*, when the writer was twenty-six years old; and published in 1837 *Thoughts in August*, which, though not remarkable as triumphs of versification, are elegant and worthy of being read, the same delicate grace distinguishing their author as a poet which has earned him high fame as a writer of prose. He had already, in 1829, published a volume of elegiac poems under the pseudonym of Joseph Delorme, to whom he attributed them as posthumous remains. Emile Deschamps (1791–1871), who was also a dramatist, wrote *French and Foreign Studies* in light and fluent verse; whilst his brother Antoni (1800–1869) is best known as the skilful and not ungraceful translator of Dante, and as the author of a volume of refined *Studies of Italy*, reminiscences of his sojourn for some years in the south of Italy. Théophile Gautier (1811–1872), a writer of romances, voyages, and general essays, a literary, dramatic, and art critic, is also known for two or three volumes of spirited and graceful verse; *The Comedy of Death* (1838), and *Enamels and Cameos* (1852) amongst them.

The Critics.

The three famous lecturers of the Sorbonne, by whom the University of Paris revived under the Restoration all its ancient glories — Guizot, Villemain, and Cousin — were the head and front of the complex school of thought which inspired the timid governments of Louis XVIII and Charles X with so much alarm. Villemain (1790–1869) was in every way fitted to be an apostle of innovation. Himself purely classical in his training, in his intellectual bent and faculties, he was not inferior in point of style to the polished writers of the preceding century. He devoted himself chiefly to literary studies; and in 1812 his *Eulogy of Montaigne* was crowned by the Academy. The like honour was earned, at intervals of two years, by a discourse on *The Advantages and Inconveniences of Criticism*, and a *Eulogy of Montesquieu*. As a professor he delivered the most successful and brilliant lectures, of which those up to 1826 are lost, but those dating from that time were subsequently published as a *Course of French Literature: a Picture of the Eighteenth Century*. His popularity as a lecturer was great.

Amongst the distinctively literary critics who earned their first celebrity in the pages of a newspaper, and of whom several have obtained a more than journalistic fame, none is more eminent than Sainte-Beuve, whom we have already encountered in the *Cénacle* of Victor Hugo. Of his poems we have already spoken. The measure of his critical faculty may be taken in a work published in 1828, which is one of the most remarkable, if not the most brilliant and caustic, of all that he has written. This was a *Historical and Critical Sketch of French Poetry in the Sixteenth Century*, a work of great perspicacity, dealing in a fresh and vigorous style with the age of Ronsard and the Pléiade. As a literary critic, pure and simple,—and this must always be Sainte-Beuve's best title to esteem,—he was bold, independent, and nothing if not pungent, hiding this pungency often under an appearance of bonhomie. His *Literary Portraits* and *Contemporary Portraits* bear witness not only to enthusiasm, hero-worship, and dogmatism; but also to a generous attachment to the

principles which he had adopted, and to his freedom from conventionality, and his superiority to merely traditional judgments.

Vitet (1802–1873), another of the contributors to the *Globe*, is honourably known for his trilogy on the epoch of the Ligue, which he elucidated in his *Barricades* (1826), the *States of Blois*, and the *Death of Henry III.*

As a literary historian, dominated by the march of the new ideas of the century, Napoleon-Désiré Nisard (1806), who succeeded Villemain in his professorship, is a writer of great elegance and painstaking accuracy. His principal works, most of which were published before 1848, are a volume on the *Latin Poets of the Decadence*, an *Abstract of the History of French Literature*, and a fuller *History of Literature*, the publication whereof occupied him during the last five years of Louis Philippe's reign. Jean-Jacques Ampère (1800–1864) also takes worthily his place among the splendid array of literary critics of the reign of Louis Philippe. He wrote several books of travel and literary essays, but is best known as an historian by his erudite *Literary History of France before the twelfth century*, to which the author of this present book is under great obligations; a *Roman History at Rome*, published in 1861, and the three following years; and *The Roman Empire at Rome*, which appeared after Ampére's death.

Last on our list of critics and historians stands Alexis de Tocqueville (1805–1859), who, at an early age, was sent with M. de Beaumont (1802–1866) to the United States, in order to study the prison-system there. On their return, they published in 1832 the result of their observations, under the title *The Penitentiary System in the United States, and its Application to France*, which was a strong plea in favour of the cellular system as practised in Philadelphia, namely, perfect isolation of the prisoner by night as well as by day. Three years later de Tocqueville published the first part of his *Democracy in America*, of which the second part appeared in 1840. This book produced a great sensation, and founded, as it were, a new political school, having for its aim individual liberty and decentralisation.

The Philosophers.

Victor Cousin was born in 1792, at Paris, and was one of the most brilliant pupils of the Lycée Charlemagne. He passed thence to Ecole Normale, and, in the year of the Restoration, became Assistant Professor to Royer-Collard at the Sorbonne. He adopted vigorously the doctrines of that philosopher, which practically amounted to a translation of the Scottish school of Reid and Stewart, but he soon combined with them much that he borrowed from Kant and his successor in Germany. His brilliant but patchy eclecticism had had its day, and he saw it; but he earned new and perhaps more lasting laurels by betaking himself to the study of French literary history, and producing some charming essays on the ladies of the Fronde. Cousin's history is interesting as an instance of the accidental prosperity which in the first half of this century the mixture of politics and literature brought to men of letters. But his own literary merits are very considerable. Without the freedom and originality of the great writers who were for the most part his juniors by ten or twelve years, he possessed a style studied from the best models of the seventeenth century, which, despite a certain artificiality, has great beauty. Besides editions of the philosophical classics, the chief works of his earlier period are *Fragments Philosophiques*, 1827, *Cours de l'Historie de la Philosophie*, 1827; of his later, *Du Vrai, Du Beau et Du Bien*, and his studies on the women of the seventeenth century.

Less known perhaps to succeeding generations than either Cousin or Jouffroy was Maine de Biran (1766–1824), a disciple of Condillac, though with a decided tendency towards materialism. In 1805 he broke decidedly with the school in which he had been trained, and more or less heartily adopted the ideas of Royer-Collard, whom in fact he had anticipated in his objection to the views of his first teacher. Royer-Collard declared that Maine de Biran was "the master of all of us"; whilst Victor Cousin himself called him "the first metaphysician of our time." His *Journal Intime* contains many acute and interesting notes on Bonald's *Philosophical Researches*, on Lamennais' *Essay on Indifference*, and on such works as those of Droz (1773–1850), Laromiguière (1756–1837), Bérard (1789–1828), Destutt de Tracy (1754–1836), developed Condillac in his *Elements of Ideology;* Broussais (1772–1838), violently attacked the eclectics in his essay on *Irritation and Folly;* Charles Fourier (1772–1837) advanced some crude theories, which were known by the title of *Social Mechanics;* Saint Simon (1762–1825) set up his counter-scheme of Christianity upon the "rehabilitation of the flesh," and further developed a scheme of socialism. Shortly before his death he founded a journal called the *Producteur*, devoted to industrial topics and interests, which had amongst its earliest contributors Auguste Comte (1798–1857), Augustin Thierry (1795–1856), Rodrigue (1794–1850), Enfantin (1796–1864), and others.

The Novelists.

Of the novelists none was more genuinely a type of the romantic school than Prosper Mérimée. Born at Paris, the son of a distinguished painter and savant, Mérimée was a man of letters from his boyhood. He was barely twenty-two when he published *The Dramas of Clara Gazul, a Spanish Actress*, which, of course, were not Spanish; and within a few years he betrayed the gradual settling of his mind in its destined groove by the production of *La Guzla, a selection of Illyriaw Poetry* (1827), which were again poems from a pretended foreign source, but really written by Mérimée himself; the *Jacquerie, Scenes of Feudalism* (1828), the *Chronicle of the reign of Charles IX* (1829), and *Mosaic*, a collection of stories (1833). In historical romance his best tale is *The Carrying of the Redoubt*, very short but very characteristic.

Less brilliant, less polished in form, but more acute and infinitely more profound than Mérimée, was Henri Beyle (1783–1842), who wrote under the name of de Stendhal, the predecessor, the master, and the friend of the author of *Colomba*. Balzac has described him as "one of the most remarkable writers of our times;" he might have said one of the greatest, if Beyle had not wasted his powers in dilettantism. Thus he wrote two novels of surprising depth and analytic power — *La Chartreuse de Parme* and *Rouge et Noir* — the former of which, said again Balzac, was one of the finest ever written. Stendhal composed a series of tales of perfect symmetry, like *The Abbess of Castro.*

The name of H. de Latouche (1785–1851) has already passed in the recollection of Frenchmen.

Alexandre Dumas was born at Villers-Cotterets, a short distance from Paris, on the 24th of July, 1803. From the first he had been conscious of his own literary instincts, but his mind was so uncultivated that he had to employ his leisure hours in laborious self-instruction. The talent of Alexandre Dumas was so many-sided that he, perhaps, had no idea of taking to fiction until chance accidentally led him to this new ground. It was only towards 1840 that he revealed his qualifications as a novelist. Attention was first centred upon his *Travelling Impressions*, wherein truth, wit, and harmless mendacity are so cleverly blended, that the mendacity is forgotten in favour of the wit. These were quickly followed by *The Three Musketeers*, the one of Alexandre Dumas' novels which is probably destined to outlive all the others. This work, within certain limits, may be described as a masterpiece. Dumas remained nearly up to his death the most popular, as well as the most productive of French novelists. He continued *The Three Musketeers*, wrote story after story with incredible rapidity, and whether in *Queen Margot*, the *Quarante-Cinq*, *Diane de Poitiers*, and the endless succession of historical novels that issued from his pen, or in *Diane de Clèves*, and *Ange Pitou*, his qualities were seldom at fault. These qualities we may resume in a few phrases: for brilliancy of improvisation, for ingenuity of invention, Alexandre Dumas has no equal.

George Sand (1804–1876), a woman of talent who has immortalised her *nom de plume* by so many admirable tales of passion, joy, and grief, is a writer as different from the dashing Dumas as is well possible. Her works were more thoughtful, concentrated, and meditative. *Valentine*, *Indiana*, *Lelia*, *Mauprat*, followed each other. She was often carried away by her generous impulses and noble instincts; and the otherwise charming stories of *Simon*, *le Meunier d'Angibault*, *Le Peché de M. Antoine*, were not free of paradox. She was an indefatigable worker; and if *Jean de la Roche*, *Le Marquis de Villemer*, *Césarine Dietrich*, have not pleased as much as *Les Beaux Messieurs de Bois-Doré*, the productions of her old age were worthy of her talent.

Charles de Bernard du Grail (1805–1850) has written two works, *Gerfaut* and *Le Gentilhomme Campagnard*, that deserve to remain as models of fiction. Of all French novelists of the literary movement of 1830, Charles de Bernard was the one whom Thackeray professed to admire as a model.

If it were enough for a writer to produce one single perfect work Frederick Soulié (1800–1847) should be a great novelist, for *Le Lion Amoureux*, a story of the highest dramatic bent, made up of the simplest incidents of life, can be read and re-read. Soulié's productions are numerous and of very unequal merit.

Opinions may vary upon the nature of such works as *The Mysteries of Paris* and *The Wandering Jew;* but there can be but one opinion with regard to the rare power of invention shown by their author Eugène Sue (1804–1857). Sainte-Beuve has branded him as the de Sade of modern fiction. This is an exaggeration; but if his pen was responsible for little harm, it did no good.

At the beginning of Louis Philippe's reign, Victor Hugo had already earned his place amongst the leading writers of the French romance by his *Last Days of a Condemned Man* (1829), and *Notre Dame de Paris.* Subsequently Victor Hugo acquired more substantial titles to the name of novelist.

The Last Chouan (1827) was the earliest work of Honoré de Balzac, which he published with his own name on the title

page. In a few years Honoré de Balzac was a household word in France, and in Paris especially, whose life he had shown himself able to photograph with so much fidelity, and to surround with such a brilliant halo. He is the prince of French novelists. *The Philosophy of Marriage*, the *Bal de Sceaux*, *Gobseck*, *A Double Family*, came in succession from his enchanted pen. He left behind him five dramas: *Vautrin*, *The Resources of Quinola*, *Pamela Giraud*, *The Stepmother*, and *Mercadet*; lives of La Fontaine and Molière, a *Monograph on the Parisian Press*, essays and letters innumerable, not to mention frequent contributions to many newspapers.

With the mantle of Rabelais upon his shoulders he sat down to his *Physiology of Marriage; or, A Meditation of Eclectic Philosophy upon Conjugal Happiness and Unhappiness; published by a young bachelor.* Balzac's characters are never quite human, and the atmosphere in which they are placed has something of the same reality (though it is for the most part tragically and not comically unreal), as that of Dickens. Everything is seen through a kind of distorting lens, yet the actual vision is defined with the most extraordinary precision, and in the most vivid colours. Balzac had great drawbacks. Despite his noble prefix he cannot conceive or draw either a gentleman or a lady. His virtuous characters are usually virtuous in the theatrical sense only; his scheme of human character is altogether low and mean. But he can analyse vice and meanness with wonderful vigour, and he is almost unmatched in the power of conferring apparent reality upon what the reader nevertheless feels to be imaginary and ideal.

The Naturalistic or Realistic School.

According to this most recent school, literature is to be strictly "scientific," to confine itself to anatomy, and, it would appear, to morbid anatomy only. The Romantic treatment, that is to say, the presentation of natural facts in an artistic setting, is rigidly proscribed. Everything must be set down on the principle of a newspaper report, or, to go to another art for an illustration, as if by a photographic camera, not by an artist's pencil. Now it will be obvious to any impartial critic that the pursuance of this method is in itself fatal to the interest of a book. The reader, unless of the very lowest order of intellect, does not want in a novel a mere reproduction of the facts of life, still less a mere scientific reference of them to causes. Accordingly, the naturalist method inevitably produces an extreme dullness. In their search for a remedy, its practitioners have observed that there are certain divisions of human action, usually classed as vice and crime, in which, for their own sake, and independently of pleasure in artistic appreciation of the manner in which they are presented, a morbid interest is felt by a large number of persons. They, therefore, with business like shrewdness, invariably, or almost invariably, select their subjects from these privileged classes. The ambition of the naturalist, briefly described without epigram or flippancy, but as he would himself say scientifically, is to mention the unmentionable with as much fulness of detail as possible. In this business M. Emile Zola has not hitherto been surpassed, though many of his pupils have run him hard. Unfortunately, for those who are proof against the attraction of disgusting subjects merely because they are disgusting, M. Zola is one of the dullest of writers. His style is also very bad, possessing for its sole merits a certain vulgar vigour which is occasionally not ineffective, and a capacity for vivid description. He is deeply learned in *argot*, or slang, the use of which is one of the naturalist instruments, and his works are therefore not useless as repertories of expressions to be avoided. M. Zola's criticisms are more interesting than his novels, consisting chiefly of vigorous denunciations of all the good writers of his own day.

Conclusion.

The first thing, and perhaps the most important thing, which must strike anyone who looks upon French literature as a whole, is that, taking all conditions together, it is the most complete example of regularly and independently developed national literature that presents itself anywhere. It is no doubt inferior in the point of independence to Greek, but then it has a much longer course, considered as the exponent of national character. It has a shorter course than English, and it is not more generally expository of national characteristics; but then it is for a great part of that course infinitely more independent of foreign influences, and, unlike English, it has scarcely any breaks or dead seasons in its record. Compared with Latin (which as a literature may be said to be entirely modelled on Greek) it is exceptionally original; compared with Spanish and Italian it has been exceptionally long-lived and hale in its life; compared with German it was exceptionally early in attaining the full possession of its faculties.

The French made their own epic, their own lyric, their own comic and miscellaneous drama. They may be said almost to have invented the peculiar and striking kind of history called the memoir, which has characteristics distinguishing it radically from the classical commentary. They apparently invented the essay, and though they only borrowed the beast-fable, they are entitled to the credit of having seen in it the germ of the short verse tale which has no direct moral bearing. All the nations of Europe, so to speak, sent during the middle ages their own raw material of subject to be worked up by French or French-speaking men into literary form. France therefore gives (next to Greece, and in some respects even before Greece) the most instructive and trustworthy example extant of the chronology and order of spontaneous literary development — first poetry, then drama, then prose. In poetry, first epic, then lyric, then didactic and miscellaneous verse. In drama, first ceremonial and liturgic pieces, then comedy, then artificial tragedy. In prose, first history, then miscellaneous work, and lastly artificial and elaborate fiction. The qualities which this general differentia has developed in French may now be enumerated.

The first is a great and remarkable *sobriety*. It is true that there is nothing more extravagant than an extravagant Frenchman, but that is the natural result of reaction. As a rule, the contributions of matter which France received so abundantly from other nations are always toned and sobered by her in their literary formation.

The next characteristic is abundant and almost superabundant *wit*. The terms wit and humour have been argued over even more than classical and romantic, and it is equally impossible to enter into the controversy here. Suffice it to say that, according to the most satisfactory definition of humour (thinking in jest while feeling in earnest), wit might be defined to be thinking in jest without interrogating the consciousness as to whether the feeling is earnest or not. At a very early period, as soon indeed as the French spirit had thoroughly emerged from its German-Latin-Celtic swaddling clothes, this faculty of half reckless thinking in jest made its appearance.

A third quality closely connected with the two former, but not, like satirical criticism, simply derived from them, is the close *attention to form* which has always distinguished French. At the present time, despite the great advance made by other literatures and a certain falling off in itself, French prose is on the average superior in formal merit to any other prose written in a modern language. A fourth merit is to be found in the *inventiveness* of Frenchmen of letters. In no literature is there a greater variety, and in none is that variety so obviously the effect not of happy blundering but of organized and almost scientific development of the possibilities of art. To these main characteristics others which are in a way corollaries might be added, such as urbanity, ease, ready adaptation to different classes of subject, and the like. But those already dwelt upon are the principal, and they have sufficed to make French, as far as general usefulness and interest go, the best vehicle of expression in prose among European languages. In poetry it is not quite the same. Most of the qualities just enumerated are in poetry but of secondary use, some of them are almost directly unfavourable to the vagueness, the indefinite suggestion, the "making the common uncommon," which are necessary to poetry. The clearness of French prose has a tendency to become colourless in French poetry, its sobriety turns to the bald, its wit to conceit and prettinesses, its inventiveness to an undue reliance on complicated devices for creating an artificial attraction, its sense of form and rule to dryness and lack of passion. Moreover the merely sonorous qualities of French render it a difficult instrument for the production of varied poetical sounds. It is almost wholly destitute of quantity, and the intonation which supplies that want is of such a kind that hardly any foot but the iambus is possible in it.

At the close of the eleventh century and at the beginning of the twelfth we find the vulgar tongue in France not merely in full organization for literary purposes, but already employed in most of the forms of poetical writing. All the literature is so far connected purely with the knightly and priestly orders, though it is largely composed and still more largely dealt in by classes of men, trouvères and jongleurs, who are not necessarily either knights or priests, and in the case of the jongleurs are certainly neither. By degrees also in this twelfth century forms of literature which busy themselves with the unprivileged classes begin to be born. The fabliau takes every phase of life for its subject; the folk-song acquires elegance and does not lose raciness and truth. In the next century, the thirteenth, mediæval literature in France arrives at its zenith and remains there until the first quarter of the fourteenth. The early epics lose something of their savage charm, the polished literature of Provence quickly perishes. But in the provinces which speak the more prevailing tongue nothing is wanting to literary development. The language itself has shaken off all its youthful incapacities, and, though not yet well adapted for the requirements of modern life and study is in every way equal to the demands made upon it by its own time. The dramatic germ contained in the fabliau and quickened by the mystery produces the profane drama. Throughout the fifteenth century the process of enriching or at least increasing the vocabulary goes on.

Then comes the grand upheaval of The Renaissance and The Reformation. Rabelais, Amyot, Calvin, and Herberay fashion French prose; Marot, Ronsard, and Regnier refashion French verse. At this period Malherbe and Balzac make their appearance. Unable to deal with the whole problem, they determined to deal with part of it, and to reject a portion of the riches of which they feel themselves unfit to be stewards. Balzac and his successors make of French prose an instrument faultless and admirable in precision, unequalled for the work for which it is fit, but unfit for certain portions of the work which it was once able to perform. Malherbe, seconded by Boileau, makes of French verse an instrument suited only for the purposes of the drama of Euripides, or rather of Seneca, with or without its chorus and for a certain weakened echo of that chorus under the name of lyrics. No French verse of the first merit other than dramatic is written for two whole centuries.

Practitioners of the highest skill apply the language during the seventeenth century, while during the eighteenth its powers are shown to the utmost of their variety by Voltaire, and receive a new development at the hands of Rousseau. Yet, on the whole, it loses during this century. It becomes more and more unfit for any but trivial uses, and at last it is employed for those uses only. Then occurs the Revolution, repeating the mighty stir in men's minds, which the Renaissance had given, but at first experiencing more difficulty in breaking up the ground and once more rendering it fertile. The faulty and incomplete genius of Chateaubriand and Madame de Staël gives the first evidence of a new growth, and after many years the romantic movement completes the work. That movement occupied almost the whole of two generations; and though at the close of the second its force may appear to be spent, the results remain, and no new or reactionary movement is visible, and the efforts of the Romantics themselves have been crowned with an almost complete regeneration of letters, if not of language. The poetical power of French has been once more triumphantly proved, and its productiveness in all branches of literature has been renewed, while in that of prose fiction there has been almost created a new class of composition. For volume and merit taken together the product of these eight centuries of literature excels that of any European nation, though there is no really great epic in French, few great tragedies, and those imperfect and in a faulty kind, little prose like Milton's or like Jeremy Taylor's, little verse (though more than is generally thought) like Shelley's or like Spenser's. But there are the most delightful short tales, both in prose and in verse, that the world has ever seen, the most polished jewelry of reflection that has ever been wrought, songs of incomparable grace, comedies that must make men laugh so long as they are laughing animals, and above all such a body of narrative fiction, old and new, prose and verse, as no other nation can show for art and for originality, for grace of workmanship in him who fashions, and for certainty of delight to him who reads.

BIBLIOGRAPHY.—See *Histoire littéraire de la France*, begun by the Benedictines and continued by members of the Institute, i–xxx (1733–1888), reaching as far as the Middle Ages. See works of J. J. Ampère, Léon Gautier, Gidel, Albert, Aubertin, Géruzez; Ozanam, *Poètes franciscans au XIII^e Siècle*, and Demogeot. William of Orange, 508–512.
Woollen manufacture, 459.
Wörth, battle of, 552.
Yolande of Aragon, 485
Zola, E., 600.
Zurich, battles of, 538; peace of, 550.

TABLE *of the Rulers of France from* 481 *to* 1879 A. D.

I. *The Merwing or Merovingian Kings.*

Hlodowig (Clovis) king of Franks,	481–511
Theodorik (king of Metz), 511–534; Hlodomir (king of Orleans), 511–524; Hildebert (king of Paris), 511–558; Hlotair I. (king of Soissons, 511–561, sole king of Franks, 558–561); Theodebert (king of Austrasia), 534–548; Theodebald (kiug of Austrasia), 548–555; Haribert (king of Paris), 561–567; Gontran (king of Orleans and Burgundy), 561–593; Sigebert (king of Austrasia), 561–575.	
Hilperik I. (king of Soissons, 561–584), king of Neustria,	567–584
Hlotair II. (king of Soissons, 584–624, sole king,	584–628
Dagobert I., sole king,	628–638
Hlodowig II. (king of Neustria and Burgundy),	638–656
Hlotair III. (king of Neustria and Burgundy),	656–670
Hilderik II. (king of Austrasia, 660–674), sole king,	670–673
Theodorik III. (king of Neustria, 673–679), sole king,	673–691
Hlodowig III. (king of Neustria and Burgundy),	691–695
Hildebert III. (king of Neustria and Burgundy),	695–711
Dagobert II. (or III.), (king of Neustria and Burgundy),	711–715
Hilperik II. (king of Neustria),	715–720
Theodorik IV. (king of Neustria, Austria, and Burgundy), Interregnum,	720–737 737–742
Hilderik III. (king of Neustria, Austrasia, and Burgundy),	742–752
[In 752 Pippin the Short, duke and prince of Franks, prince of Neustria in 741, and sole prince in 747, deposed Hilderik III.]	

II. *The Austrasian Kings.*

Pippin the Short,	752–768
Charles (Karl) the Great (with Carloman, 768–771, emperor, 800–814),	768–814
Louis (Ludwig) I., the Débonnaire (emperor),	814–840
Charles I., the Bald (emperor, 875–877),	840–877
Louis II., the Stammerer,	877–879
Louis III. (in Northern France) and Carloman (in Aquitaine and Burgundy),	879–882

Carloman (sole king),	882–884
Charles II., the Fat (emperor, 881–888)	884–888
Eudes (or Odo), count of Paris, elected king by the barons,	888–898
Charles III., the Simple,	892–929
Robert, king of the barons,	922–923
Rodolf, king of the barons,	923–936
Louis IV., Outremer,	936–954
Lothair,	954–986
Louis V.,	986–987
[On his death the next in hereditary succession was his uncle Charles of Lorraine, the barons, however, elected Hugh Capet as king of France.]	

III. *The House of Capet.*

Hugh Capet,	987–996
Robert,	996–1031
Henry I.,	1031–1060
Philip I.,	1060–1108
Louis VI. (le Gros),	1108–1137
Louis VII. (le Jeune),	1137–1180
Philip Augustus (II.),	1180–1223
Louis VIII.,	1223–1226
Louis IX. (Saint Louis),	1226–1270
Philip III. (le Hardi),	1270–1285
Philip IV. (le Bel),	1285–1314
Louis X. (le Hutin),	1314–1316
John (posthumous son of Louis X.),	1316
Philip V. (le Long),	1316–1322
Charles IV. (le Bel),	1322–1328

IV. *The House of Valois* (descended from Philip III.).

Philip VI.,	1328–1350
John II. (le Bon),	1350–1364
Charles V. (le Sage),	1364–1380
Charles VI. (le Bien-aimé),	1380–1422
Charles VII. (le Victorieux),	1422–1461
Louis XI.,	1461–1483
Charles VIII.,	1483–1498
Louis XII.,	1498–1515
Francis I.,	1515–1547
Henry II.,	1547–1559
Francis II.,	1559–1560
Charles IX.,	1560–1574
Henry III.,	1574–1589

V. *The House of Bourbon* (descended from Robert of Clermont, son of Saint Louis).

Henry IV.,	1589–1610
Louis XIII.,	1610–1643
Louis XIV.,	1643–1715
Louis XV.,	1715–1774
Louis XVI.,	1774–1793
The Republic,	1792–1799
The Consulate (Napoleon Bonaparte, First Consul),	1799–1804
Napoleon I., emperor of the French,	1804–1814
Louis XVIII. (Louis XVII. never reigned),	1814–1815
Napoleon I. (March 20 to June 24),	1815
Louis XVIII.,	1815–1824
Charles X.,	1824–1830
Louis Philippe I. (house of Orleans, descended from Philip, second son of Louis XIII.),	1830–1848
The Republic, Louis Napoleon president,	1848–1852
Napoleon III., emperor of the French,	1852–1870
The Republic,	1870–1879

FRANCE, Isle of. See Mauritius.

FRANCESCA. See Pietro della Francesca.

FRANCESCHINI, Baldassare (1611–1689), a painter of the Tuscan school, named, from Volterra the place of his birth, Il Volterrano, or (to distinguish him from Ricciarelli) Il Volterrano Giuniore, was the son of a sculptor in alabaster. At a very early age he learned from Cosimo some of the elements of art, and he started as an assistant to his father. This employment being evidently below the level of his talents, the Marquises Inghirami placed him, at the age of sixteen, under the Florentine painter Matteo Rosselli. In the ensuing year he had advanced sufficiently to execute in Volterra some frescoes, skilful in foreshortening, followed by other frescoes for the Medici family in the Valle della Petraia. In 1652 the Marchese Filippo Niccolini, being minded to employ Franceschini upon the frescoes for the cupola and back-wall of his chapel in S. Croce, Florence, despatched him to various parts of Italy to perfect his style. The painter, in a tour which lasted some months, took more especially to the qualities distinctive of the schools of Parma and Bologna, and in a measure to those of Pietro da Cortona, whose acquaintance he made in Rome. He then undertook the paintings commissioned by Niccolini, which constitute his most noted performance, the design being good, and the method masterly. Franceschini ranks higher in fresco than in oil painting. His works in the latter mode were not unfrequently left unfinished, although numerous specimens remain, the cabinet pictures being marked by much sprightliness of invention. Among his best oil paintings of large scale is the St. John the Evangelist in the church of S. Chiara at Volterra. One of his latest works was the fresco of the cupola of the Annunziata, which occupied him for two years towards 1683, a production of much labor and energy. Franceschini died of apolexy at Volterra on 6th January, 1689. He is reckoned among those painters of the decline of art to whom the general name of "machinist" is applied. He is not to be confounded with another Franceschini of the same class, and of rather later date, also of no small eminence in his time—the Cavaliere Marcantonio Franceschini, who was a Bolognese (1648–1729).

FRANCHE COMTÉ, from 1674 till the great Revolution one of the provinces of France, was bounded on the E. by the principality of Montbéliard or Mömpelgard and Switzerland, S. by Bresse, Bugey, and Gex, N. by Lorraine, and W. by the duchy of Burgundy and Champagne. It lay to the west of the Jura, and included the valley of the upper Saône and the greater part of the valley of the Doubs. In earlier history it is usually called the countship of Burgundy or Upper Burgundy; in later French history, on the other hand, it is frequently mentioned as the countship (la Comté) *par excellence*. The countship probably took its rise in the 10th century as a fief of the kingdom of Burgundy, which was dependent on the empire. It was held in the beginning of the 11th by Otto William, the warlike son of the king of the Lombards; his son and successor Reinhold or Reinaud I. ventured to refuse his homage to his suzerain Henry III., and his example was followed about a century afterwards by Reinhold III., who took up a position of independence against the emperor Lothar. In neither case was the attempt to throw off the yoke permitted to succeed, but on the latter occasion at least the prestige of the countship was improved, and according to one theory the honorable title of Free Countship (*Freigrafschaft*) was then acquired. After Lothar's death Reinhold again refused homage to the emperor Conrad, and though the emperor consequently bestowed his countship on Conrad of Zähringen, Reinhold was still in actual possession at his death in 1148. His daughter and heiress Beatrix was married to Frederick Barbarossa in 1156; and on her decease in 1185 Frederick bestowed the countship on his third son Otto, and raised Besançon to the rank of a free imperial city. Otto's daughter Beatrix married Duke Otto of Meran, and was succeeded first by their son Otto and afterwards by their daughter Alix. Otto, the son of Alix, offended the emperor Rudolph I., and his city Besançon was consequently besieged by the imperial troops in 1289; but it made a successful defence, and peace was soon afterwards concluded. A treaty was made with Philip the Fair of France, by which Otto's daughter Johanna was to marry Philip of Poitiers the king's second son, and the suzerainty of France was to be recognized by Franche Comté. The marriage took place in due course in 1307, and the importance attached by the king to his claims on Franche Comté is shown by the leniency with which the charges against the princess Johanna or Jeanne were enforced when her sisters-in-law were degraded and imprisoned and their paramours tortured and executed. On Philip's death in 1322 the countship passed to Otto IV., duke of Burgundy, and it was successively held by Philip de Rouvre, Margaret of France, Louis de Male, and Charles the Bold. On Charles's death, Louis XI. of France claimed the protectorate "for the good of the country and the lady of Burgundy, and in favor of the marriage of the dauphin with that lady." By feudal law the countship still held of the empire, being a German and a female fief; but the states accepted the French protection (February, 1477), and the claims of Maximilian were appeased by the promise of the hand of Charles of France for his daughter Margaret. In April, however, a rebellion broke out; the emperor recalled the people to their allegiance, and the Swiss hastened to support the popular cause. The French were constrained to withdraw; but in 1479 the Sire de Chaumont invaded the country, captured Dôle in spite of a vigorous defence, in which the students of the university displayed a desperate but resultless valor, and forced the people to submit. Besançon, the free imperial city, recognized the French king on the same conditions which it had demanded from the dukes of Burgundy, and promised to pay over half the product of its taxes. The parliament of Dôle was transferred to Salins, and the university to Besançon. When Charles VIII. refused to marry Maximilian's daughter, the people of Franche Comté rose in revolt, and the king relinquished his claims by the treaty of Senlis, May 23, 1493. Along with the rest of the domains of the house of Burgundy the countship was bestowed on Philip, Maximilian's son, and passed to the crown of Spain. As a Spanish territory its position was a peculiar and isolated one; and it was consequently treated with great leniency by the Spanish Government. It paid a "gratuitous gift"

of not more than 200,000 livres every three years, and furnished very few soldiers to the royal army. Under the nominal authority of the governor-general of the Low Countries, it was practically governed by the parliament of Dôle and a governor chosen from the ranks of its own nobility. In 1668 Louis XIV. cast his eyes on the province, and Condé effected its conquest in fifteen days. On the 14th of February the king swore at Dôle to preserve the liberties of the town and province as count palatine of Burgundy, and the parliament issued an edict against those who refused to submit to his authority. By the peace of Aix-la-Chapelle, which almost immediately followed, Franche Comté was restored to Spain; but in 1674 Louis made a new invasion. Besançon was taken after a lengthened siege, at which Vauban and the king were both personally present; Dôle shared the same fate; and by the 4th of July the whole country was again in the hands of the French. To celebrate the conquest the triumphal arch of the Saint Martin gate at Paris was erected. The countship now became a French province; its gratuitous donation became a regular impost, which was soon after increased in amount; and the chief authority was placed in the hands of a governor-general. Instead of three great bailiwicks, as formerly, there were four:—Amont, Aval, Besançon, and Dôle—their chief towns being Vesoul, Salins, Besançon, and Dôle. See Clerc, *Histoire de la Franche Comté*.

FRANCHISE, in law, means some right or privilege, of a local or exclusive character, *e.g.*, the right of free fishery. The term is more particularly applied to the right of voting at an election for a member of parliament. See PARLIAMENT.

FRANCIA, a celebrated Bolognese painter was born towards 1450, and died 6th January, 1517. His real name was Francesco Raibolini, his father being Marco di Giacomo Raibolini, a carpenter; he was apprenticed to a goldsmith named Francia, and from him probably he got the nickname whereby he is generally known; he, moreover, studied design under Marco Zoppo. The youth was thus originally a goldsmith, and also an engraver of dies and niellos, and in these arts he became extremely eminent. He was particularly famed for his dies for medals; he rose to be mint-master at Bologna, and retained that office till the end of his life. A famous medal of Pope Julius II. as liberator of Bologna is ascribed to his hand, but not with certainty. At a mature age—having first, it appears, become acquainted with Mantegna—he turned his attention to painting. His earliest known picture is dated 1494 (not 1490, as ordinarily stated). It shows so much mastery that one is compelled to believe that Raibolini must before then have practised painting for some few years. This work is now in the Bologna gallery,—the Virgin enthroned, with Augustine and five other saints. It is an oil picture, and was originally painted for the church of S. Maria della Misericordia, at the desire of the Bentivoglio family, the rulers of Bologna. The same patrons employed him upon frescoes in their own palace; one of Judith and Holophernes is especially noted, its style recalling that of Mantegna. Francia probably studied likewise the works of Perugino; and he became a friend and ardent admirer of Raphael, to whom he addressed an enthusiastic sonnet. Raphael cordially responded to the Bolognese master's admiration, and said, in a letter dated in 1508, that few painters or none had produced Madonnas more beautiful, more devout, or better portrayed than those of Francia. If we may trust Vasari —but it is difficult to suppose that he was entirely correct— the exceeding value which Francia set on Raphael's art brought him to his grave. Raphael had consigned to Francia his famous picture of St. Cecilia, destined for the church of S. Giovanni in Monte, Bologna; and Francia, on inspecting it, took so much to heart his own inferiority, at the advanced age of about sixty-six, to the youthful Umbrian, that he sickened and shortly expired. Distanced though he may have been by Raphael, Francia is rightly regarded as the greatest painter of the earlier Bolognese school, and hardly to be surpassed as representing the art termed "anticomoderno," or of the "quattrocento." It has been well observed that his style is a medium between that of Perugino and that of Giovanni Bellini; he has somewhat more of spontaneous naturalism than the former, and of abstract dignity in feature and form than the latter. The magnificent portrait in the Louvre of a young man in black, of brooding thoughtfulness and saddened profundity of mood, would alone suffice to place Francia among the very great masters, if it could with confidence be attributed to his hand, but in all probability its real author was Francia-bigio; it had erewhile passed under the name of Raphael, of Giorgione, or of Sebastian del Piombo. The London National Gallery contains two remarkably fine specimens of Francia, once combined together as principal picture and lunette,—the Virgin and Child and St. Anne enthroned, surrounded by saints, and (in the lunette) the Pietà, or lamentation of angels over the dead Saviour. They come from the Buonvisi chapel in the church of S. Frediano, Lucca. Other leading works are—in Munich, the Virgin sinking on her knees in adoration of the Divine Infant, who is lying in a garden within a rose trellis; in the Borghese Gallery, Rome, a Peter Martyr; in Bologna, the frescoes in the church of St. Cecilia, illustrating the life of the saint, all of them from the design of Raibolini, but not all executed by himself; a public passage now traverses these frescoes, and they are in a pitiful state of decay. His landscape backgrounds are of uncommon excellence. Francia had more than 200 scholars. Marcantonio Raimondi the famous engraver is now the most renowned of them; next to him, the painter Lorenzo Costa; also Amico Aspertini, and Francia's own son Giacomo, and his cousin Julio.

FRANCIA, JOSÉ GASPAR RODRIGUEZ, commonly called Dr. Francia, dictator of Paraguay, one of the most remarkable men connected with the history of South America. The date of his birth is not definitely ascertained, but probably falls about 1757. According to one account, he was of French descent; but the truth seems to be that his father, Garcia Rodriguez França, was a native of S. Paulo in Brazil, and came to Paraguay to take charge of a plantation of black tobacco for the Government. He studied theology at the college of Cordova de Tucuman, and is said to have been for some time a professor in that faculty; but he afterwards turned his attention to the law, and practised in Asuncion. Having attained a high reputation at once for ability and integrity, he was naturally selected for various important offices, and exercised great personal influence. The Robertsons, whose accounts have done so much to blacken his memory, relate how, when he was requested by one of his friends to undertake an unjust cause in his behalf, he not only refused, but went and offered his services to the man who was likely to be wronged, and by his boldness and energy secured his case. On the declaration of Paraguayan independence in 1811, he was appointed secretary to the national junta, and exercised an influence on affairs greatly out of proportion to his nominal position. When the congress or junta of 1813 changed the constitution and established a duumvirate, Dr. Francia and the Gaucho general Fulgencio were elected to the office. A story is told in connection with their installation, which recalls the self-coronation of William I. of England and Napoleon the Great. In theatrical imitation of Roman custom, two curule chairs had been placed in the assembly, one of them bearing the name of Cæsar and the other that of Pompey. Francia seated himself in the Cæsar chair, and left his colleague to play the part of Pompey as best he might. In 1814 he secured his own election as dictator for three years, and at the end of that period he obtained the dictatorship for life. He was no mere nominal sovereign; but for the next twenty-five years he might have boasted, with even more truth than Louis XIV., "L'état c'est moi." In the accounts which have been published of his administration we find a strange mixture of capacity and caprice, of far-sighted wisdom and reckless infatuation, strenuous endeavors after a high ideal and flagrant violations of the simplest principles of justice. He put a stop to the foreign commerce of the country, but carefully fostered its internal industries; was disposed to be hospitable to strangers from other lands, and kept them prisoners for years; lived a life of republican simplicity, and punished with Dionysian severity the slightest want of respect. As time went on he appears to have grown more arbitrary and despotic, more determined to maintain his mastery over the country, and more apprehensive lest he should lose it. And yet at the time of his death it is said that he was generally regretted, and his bitterest opponents cannot deny that if he did much evil he also did much good. Deeply imbued with the principles of the French Revolution, he was a stern antagonist of the church. He abolished the Inquisition, suppressed the college of theology, did away with the tithes, and inflicted endless indignities on the priests. "What

are they good for?" was his saying; "they make us believe more in the devil than in God." He discouraged marriage both by precept and example, and left behind him several illegitimate children. For the extravagances of his later years the plea of insanity has been put forward; and it was evident that his worst characteristics were at their worst when the east wind blew. The circumstances of his death were in strange keeping with his life. He was about to sabre his doctor when he was seized with a fit, and he expired the same day, September 20, 1840. He was buried in the cathedral of Asuncion, but the spot is no longer known, and a story is told by Mr. Mansfield and by Lieutenant-Colonel Thomson, to the effect that his body was dug up by some private enemies and flung into the river. On the other hand it is well known that the greatest respect was shown to his memory by those who succeeded him in the government of Paraguay. Unfortunately for the history of his administration, Francia kept no records; and he caused all his orders to be returned to him with the word "executed" on the margin, and then to be destroyed.

The first and fullest account of Dr. Francia was given to the world by two Swiss surgeons, Rengger and Longchamps, whom he had detained from 1819 to 1825—*Essai historique sur la révolution de Paraguay et la gouvernement dictatorial du docteur Francia*, Paris, 1827. Their work was almost immediately translated into English under the title of *The Reign of Dr. Joseph G. R. De Francia in Paraguay*, 1827. About eleven years after there appeared at London *Letters on Paraguay*, by J. P. and W. P. Robertson, two young Scotchmen whose hopes of commercial success had been rudely destroyed by the dictator's interference. The account which they gave of his character and government was naturally of the most unfavorable description, and they rehearsed and emphasized their accusations in *Francia's Reign of Terror*, 1839, and *Letters on South America*, 3 vols., 1843. From the very pages of his detractors Thomas Carlyle succeeded in extracting materials for a brilliant defence of the dictator "as a man or sovereign of iron energy and industry, of great and severe labor." It appeared in the *Foreign Quarterly Review* for 1843, and is reprinted in vol. iv. of the author's *Critical and Miscellaneous Essays*. Comparatively little new light has since been thrown on the subject Captain Richard F. Burton gives a graphic sketch of Francia's life and a favorable notice of his character in his *Letters from the Battlefields of Paraguay*, 1870, while C. A. Washburn takes up a hostile position in his *History of Paraguay*, 1871.

FRANCIABIGIO (1482–1525), a Florentine painter. The name of this artist is generally given as Marcantonio Franciabigio; it appears, however, that his only real ascertained name was Francesco di Cristofano; and that he was currently termed Francia Bigio, the two appellatives being distinct. He was born in Florence, and studied under Albertinelli for some months. In 1505 he formed the acquaintance of Andrea del Sarto; and after a while the two painters set up a shop in common in the Piazza del Grano. Franciabigio paid much attention to anatomy and perspective, and to the proportions of his figures, though these are often too squat and puffy in form. He had a large stock of artistic knowledge, and was at first noted for diligence. As years went on and he received frequent commissions for all sorts of public painting for festive occasions, his diligence merged in something which may rather be called workmanly offhandedness. He was particularly proficient in fresco, and Vasari even says that he surpassed all his contemporaries in this method—a judgment which modern connoisseurship does not accept. In the court of the Servi (or cloister of the Nunziata) in Florence he painted in 1513 the Marriage of the Virgin, as a portion of a series wherein Andrea del Sarto was chiefly concerned. The friars having uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin and some other heads; and the fresco, which would otherwise be his masterpiece in that method, remains thus mutilated to the present day. At Lo Scalso, in another series of frescoes on which Andrea was likewise employed, he executed in 1518–19 the Departure of John the Baptist for the Desert, and the Meeting of the Baptist with Jesus; and, at the Medici Palace at Poggio a Caiano, in 1521, the Triumph of Cicero. Various works which have been ascribed to Raphael are now known or reasonably deemed to be by Franciabigio. Such are the Madonna del Pozzo, in the Uffizi Gallery; the half figure of a Young Man, in the Louvre (a noble work, already mentioned in the article Francia); and the famous picture in the Fuller-Maitland collection, a Young Man with a Letter. These two works show a close analogy in style to another in the Pitti Gallery, avowedly by Franciabigio, a Youth at a Window, and to some others which bear this painter's recognized monogram. The series of portraits, taken collectively, places beyond dispute the eminent and idiosyncratic genius of the master. Two other works of his, of some celebrity, are the Calumny of Apelles, in the Pitti, and the Bath of Bathsheba (painted in 1523), in the Dresden Gallery.

FRANCIS I. (1494–1547), king of France, son of Charles of Orleans, count of Angoulême, and Louisa of Savoy, was born at Cognac 12th September, 1494. As heir-presumptive of the throne of France, he received special favors from Louis XII., who created him duke of Valois and in 1512 gave him the command of the army of Navarre. In this position, though achieving no important results, he conducted himself with such prudence and courage that in 1513 he was appointed to the command of the army in Picardy, where he successfully carried out the plan of defensive operations that was entrusted to him. He married Claude, daughter of Louis XII., in 1514, and succeeded him on the throne 1st January, 1515. After his accession, the first and great object that occupied his ambition was the recovery of Milan, the inheritance of which he claimed through his great-grandmother Valentina Visconti. Accordingly, while, in order to render himself secure against external attacks, he negotiated an alliance with Charles of Austria, afterwards the emperor Charles V., and the renewal of a treaty concluded by Louis XII. with Henry VIII. of England, he also began to collect his forces for an Italian expedition. The politic negotiations which won him Genoa, the acquisition of which was all-important as commanding the connection between Milan and the sea, placed the purpose of his preparations beyond all doubt, and caused Leo X. to unite in an alliance against him with the Spaniards and the Swiss. The Swiss at once occupied all the mountain passes; but Francis, guided by a Piedmontese peasant, succeeded after great labor and difficulty in leading his army over the Alps by a pass deemed impracticable, and, descending into the friendly territories of the marquis of Saluzzo, surprised and routed at Villa Franca Colonna the general of the papal cavalry, and thus outflanking the Swiss caused them to fall back upon Milan. Completely disconcerted by the sudden movement, they at first actually entered into negotiations for a truce; but receiving shortly afterwards a reinforcement of troops and their arrears of pay, they endeavored to surprise the French at Marignano. This battle, begun on the 13th September, 1515, prolonged into the night, and renewed on the following morning, was fought on both sides with furious and stubborn courage; but on the arrival of Alviano the Venetian commander to the succor of Francis, the Swiss retreated unpursued to Milan. Shortly afterwards Milan surrendered, and in November a treaty was concluded between Francis and the Swiss, which subsequently took the form of a perpetual alliance. Such rapid and brilliant success at once gave Francis a position of commanding influence, and enabled him still further to strengthen himself by additional advantageous treaties. In 1516, he compromised the long dispute with the popes by superseding the Pragmatic Sanction of Bourges by a "Concordat," an act which, while it recognized the superiority of the pope over the councils, and gave him the command of the *annates* and other rich sources of revenue, entrusted the French monarch with the power of nominating to vacant benefices. In 1517 he entered into an alliance with the emperor Maximilian and Charles I. of Spain against the Turks; and in 1518 he made an arrangement with Henry VIII. of England, by which France bought back Tournay.

On the death of Maximilian in 1519, Francis became a candidate for the imperial crown; but chiefly through the recommendation of Frederick the Wise of Saxony the choice fell on Charles I. of Spain, from that time known as Charles V. The success of Charles was prophetic of the relative positions which the two rivals were thenceforth to occupy, for the resolute and persevering ambition of the emperor, and his hitherto wholly unsuspected abilities both in war and in diplomacy, were to prove themselves more than a match for the headstrong valor and showy accomplishments of the French monarch. War between them could scarcely have been avoided, even if the materials for kindling it had not been already prepared; but inherited

disputes in regard to Navarre, Milan, Burgundy, and Arles would in any case have sooner or later rendered an appeal to the decision of the sword almost inevitable. With a view to such possibilities, the great aim of both was to secure the alliance of Henry of England and the pope, and here fortune again ultimately smiled on Charles. Francis, elated by his previous achievements on the battlefield, and chagrined at the overthrow of his hopes of obtaining the imperial crown, was naturally eager to strike the first blow; and the request of Henry II. of Navarre to aid him in regaining his kingdom came opportunely to second his wishes. Accordingly in April, 1521, he sent an army to the aid of Henry. Charles at once retaliated by an invasion of France, and in May concluded a treaty with Pope Leo X. for the expulsion of the French from Italy. Navarre after being almost won was again lost by Henry; and in Italy the French, chiefly through the blunders of Lautrec, the brother of the king's mistress, lost Milan, Genoa, and all their conquests with the exception of the stronghold of Cremona; but the attempt of the imperialists to enter France was pushed back, and Francis, following in pursuit, only by unaccountable negligence missed the opportunity of inflicting a crushing defeat on Charles between Cambray and Valenciennes. After this, difficulties continued to thicken round the French king; on the 9th January, 1522, the papal throne was mounted by Adrian VI., who had formally been tutor to Charles V., and in May Henry VIII. declared war against France; in August, 1523, a coalition was formed against her which included the pope, the emperor, the king of England, the archduke of Austria, the duke of Milan, and the principal Italian republics; and about the same time Charles Constable Bourbon, having been unjustly used by Louise of Savoy, withdrew from France, and offered his sword to Charles V. The Spanish troops crossed the French frontiers at Bayonne; the English entered Picardy, and advanced to within 11 leagues of Paris; and after the repulse of the French army despatched against Milan, the imperialists passed over into Provence and laid siege to Marseilles. Through cautious but stubbornly defensive tactics, however, both the Spanish and English incursions were foiled, and Francis was thus able to advance to the relief of Marseilles with a large army. The imperialists did not wait his approach; but, determined on retaliation, he crossed the Alps and laid siege to Pavia, where a strong Italian force had taken refuge. Here he was attacked, 24th February, 1525, by a relieving army under Bourbon and Pescara. The attack was unsuccessful; but, flushed with the victory which he believed already in his grasp, he rashly left his impregnable position, and so blundered in his manœuvres as to render his overwhelming defeat inevitable. His army was speedily either cut down or dispersed in flight, and he himself, after a desperate attempt to rally, was made prisoner and conveyed by Charles to Madrid. He only regained his liberty, 21st February, 1526, by signing a treaty whereby he ceded to Charles both Burgundy and Milan. Its stipulations were guaranteed by the retention of his two sons in the emperor's hands; but he nevertheless resolved to disregard it, and in this he was supported by Pope Clement VII. and also by Henry of England, whom jealousy and alarm at the emperor's success had induced to change sides. Though formal war was not declared, a French army was despatched to Italy, but the supineness with which the campaign was prosecuted enabled the imperialists to have it all their own way; and an army of mercenaries under Bourbon, who perished in the assault, marching unopposed to Rome, captured and sacked the city, and took the pope prisoner. On this Francis and Henry at once declared war against the emperor; but the army sent into Italy under Lautrec almost melted away before the walls of Naples: and Genoa, by suddenly declaring for the emperor, completed the ruin of the French cause in Italy. The pope soon thereafter saw it to be his interest to be reconciled with Charles; and in August, 1529, Charles and Francis agreed to the treaty of Cambray, by which Francis retained Burgundy and obtained by a ransom the release of the French princes, but renounced his claims in Italy and ceded Artois and Flanders to his rival. He also agreed to fulfil the promise entered into at Madrid to marry Eleanor of Portugal, sister of Charles, his first wife having died in 1524. During the years of peace that followed this treaty, Francis, though he had encouraged the Smalkald League in Germany, persecuted with great vigor the adherents of Protestantism in his own kingdom; but when war was again declared, he issued an edict of toleration. The pretext for the renewal of the war was the murder of the French ambassador by Duke Sforza of Milan in 1533, but hostilities were delayed till 1535, when, emboldened by the weakened condition of the emperor after his war against the Turks, Francis overran Savoy and took possession of Turin. His advantages were, however, followed up with so little energy that Charles, after driving the French out of Italy, began an invasion of Provence; and his progress was only checked by the barbarous destruction of the country before him by Anne of Montmorency. Meantime Francis attacked Flanders, and entered into an alliance with Sultan Soliman II., whose invasion of Hungary induced Charles in 1538 to consent to the ten years' truce of Nice. In 1540 Charles, while the guest of the French monarch, held out to him the hope of a complete satisfaction of his wishes through the investiture of the duke of Orleans with the duchy of Milan; but the promise, if definitely made, was never fulfilled, and Francis, finding a favorable opportunity after the disastrous issue of the emperor's expedition against Algiers, renewed on a flimsy pretext the war in 1542. An offensive alliance was formed with the Turks, the duke of Cleves, and Denmark and Sweden; separate armies attacked at various points the Spanish, Flemish, and Italian frontiers; and the united French and Turkish forces captured and burned Nice. The monotony of the indecisive conflict was relieved in April, 1544, by a brilliant French victory at Ceresole, but the success came too late to permit of its being followed up by an advance into Italy; for in the July following, the emperor from Champagne and the king of England from Picardy were marching to join their forces before the walls of Paris. The siege of Boulogne by the English gave Francis, however, sufficient time to make a show of defence such as convinced Charles of the doubtful nature of the enterprise; and without consulting the king of England he sent to Francis from Crespy terms of peace, which were signed 17th September. By this treaty France retained Burgundy and resigned its claims on Flanders, Artois, and Naples, while the duchy of Milan was promised to the duke of Orleans on his marrying one of the imperial princesses—an arrangement, however, which his death in 1545 rendered nugatory. For some time afterwards the English king continued the war in Picardy, but a treaty of peace was signed in June, 1546. As soon as peace was concluded with the emperor, the prosecution of the Protestants in France was renewed, and in 1545 an edict was passed for the expulsion of the Waldenses from Provence. The health of Francis had for several years been completely undermined, and he succumbed to an acute attack of disease, 31st May, 1547.

In the reign of Francis were combined most of the faults and excellences which have been specially prominent in the subsequent history of his country. He was in a sense the creator of a new political and intellectual era. As regards government, he was virtually the founder of the "ancient régime," whose final result and overthrow was the great Revolution; he gave its death blow to feudalism; he deprived the *parlements* of all independent power; under the auspices of the minister Du Prat he confirmed and extended the system of corruption in civil and ecclesiastical appointments; and he turned the efforts of statesmanship away from the paths of constitutional progress, and into those of military renown. His reign in its social and intellectual results was more beneficial, for if he sanctioned by his example licentiousness of manners, he at the same time gave a great impulse to refinement in taste and to intellectual progress by fostering in his country the offshoots of the Italian Renaissance. He founded in 1530 the college of France for the study of the three languages; he was himself a writer of verses, and a special friend and benefactor of artists and men of letters; and by the purchase of the great masterpieces of Italian painting and sculpture, and in the magnificent structures of Chamford, Azai-le-Redeau, Amboise, and Fontainebleau he left behind him a permanent influence on French art. Compared with his great rival Charles V., he was open, impulsive, and generous, but he was less actuated by consistent principles; he was hopelessly inferior in diplomacy, and in sagacity and comprehensiveness of purpose; he had perhaps equal abilities as a general, but his occasional victories were more than counterbalanced by the results of his own indolence and by the blunders of his subordinates; and while able to defend France against all external attacks, he was compelled to

content himself with a place second to that of the emperor in the sphere of European politics.

FRANCIS II. (1543–1560), king of France, eldest son of Henry II. and of Catherine de' Medici, was born at Fontainebleau, 19th January, 1543. He married the famous Mary Stuart, daughter of James V. of Scotland, 25th April, 1558, and ascended the French throne 10th July, 1559. During his short reign he was the mere tool of his uncles, the duke of Guise and the cardinal of Lorraine, into whose hands he virtually delivered the reins of government. The exclusiveness with which they were favored, and their high-handed proceedings, awakened the resentment of the princes of the blood, Anthony king of Navarre and Louis prince of Condé, who gave their countenance to a conspiracy with the Protestants against the house of Guise. It was, however, discovered shortly before the time fixed for its execution in March, 1560, and an ambush having been prepared, most of the conspirators were either killed or taken prisoners. Its leadership and organization had been entrusted to Godfrey du Barry, lord of La Renaudie; and the prince of Condé, who was not present, disavowed all connection with the plot. The duke of Guise was now named lieutenant-general of the kingdom, but his Catholic leanings were somewhat held in check by the chancellor Michel de l'Hôpital, through whose mediation the edict of Romorantin, providing that all cases of heresy should be decided by the bishops, was passed in May, 1560, in opposition to a proposal to introduce the Inquisition. At a meeting of the states-general held at Orleans in the December following, the prince of Condé, after being arrested, was condemned to death, and extreme measures were being enacted against the Huguenots; but the deliberations of the Assembly were broken off, and the prince saved from execution, by the king's somewhat sudden death, on the 5th of the month, from an abscess in the ear.

Varillas, *Histoire de François II.; Mémoire de Condé;* Hénault, *François II. roi de France*, 1748; De La Barre-Duparcq, *Histoire de François II.*, 1867.

FRANCIS I. (1708–1765), head of the Holy Roman Empire, the eldest son of Leopold, duke of Lorraine, was born on the 8th of December, 1708. His full name was Francis Stephen. At the age of fifteen he was sent to Vienna, where he received the Silesian duchy of Teschen. In 1735, in return for Lorraine, which Charles VI., at the end of the war of the Polish succession, gave to Stanislaus Leszczynski, Francis Stephen obtained the reversion to the duchy of Tuscany, to which he succeeded in 1737. The year before the latter date he married Maria Theresa, the daughter of the emperor Charles VI., and after the emperor's death in 1740 he was declared by his wife joint regent of her dominions. He was elected emperor after the death of Charles VII., and crowned at Frankfort on the 4th of October, 1745. He carried on extensive trading operations, and was an enthusiastic collector of works of art; but he had no energy of character, and was quite willing that the empress-queen, Maria Theresa, should do all the real work of government. When Austria and France, laying aside the animosities of two centuries, were coming to an understanding before the Seven Years' War, he was shrewd enough to see the difficulties which would inevitably arise from such an alliance. Maria Theresa, however, although she sincerely loved him, had no respect for the political judgment of her good-natured husband, and he quietly acquiesced in her will. He suddenly died at Innsbruck on the 18th of August, 1765, falling into the arms of his second son Leopold, who succeeded him as duke of Tuscany, and ultimately (after the death of Joseph II.) became emperor.

FRANCIS II. (1768–1835), the last Holy Roman Emperor, and, as Francis I., first emperor of Austria, was born in Florence on the 12th February, 1768. He was the son of the emperor Leopold II., after whose death, in 1792, he succeeded to the hereditary dominions of the house of Austria, being crowned emperor in the same year. Before this time he had gained some experience of war during the conflict of the emperor Joseph II. with the Turks. He was immediately involved in the first of his famous wars with France, in which, till 1795, he had the support of the king of Prussia. In 1794 he himself was with the Austrian army which defeated the French at Tournay; but when fortune turned on the side of France he went back to Vienna. He was compelled, mainly in consequence of the victories of Napoleon, who pressed northward from Italy into Carinthia, to conclude, on the 17th October, 1797, the treaty of Campo Formio, whereby the empire lost the greater part of the left bank of the Rhine, and Austria had to give up the Netherlands and Lombardy. Austria received in return Venetia, Friuli, Istria, and Dalmatia. In 1799 war broke out afresh, the emperor having on this occasion England and Russia as allies. During the first campaign the French were everywhere defeated; but in the following year Napoleon gained the brilliant victory of Marengo, while Moreau was equally successful at Hohenlinden. The shock of these two battles made it impossible for Austria to continue the war, and on the 9th February, 1801, she concluded the treaty of Lunéville, which confirmed that of Campo Formio, besides exacting fresh sacrifices. France now obtained the whole of the left bank of the Rhine. Once more in association with Russia and England, the emperor began another war with France in 1805. The capitulation of Ulm and the battle of Austerlitz, great as were these disasters, did not make the case of Austria hopeless, for she still had large forces, Russia was willing to continue the war, and the power of France had been seriously crippled at Trafalgar. But Francis was dispirited, and craved peace. On December 25, 1805, was concluded the treaty of Presburg, which deprived Austria of Venetia and Tyrol. In 1806, after the formation of the Confederation of the Rhine, he formally resigned the imperial crown, thus bringing to an end the Holy Roman Empire and the kingdom of Germany. Forgetting the true meaning of the word emperor, he had in 1804 proclaimed himself, as Francis I., hereditary emperor of Austria; and this title has been retained by his successors. He took no part in the war of Prussia with France in 1806, but after some time began to make preparations for a determined struggle, by which he should regain all the advantages lost in previous wars. The new conflict broke out in 1809, and the whole of Germany awaited the result with intense anxiety. Austria was unfortunate at first: but the highest hopes were excited by her thorough victory of Aspern. It was followed by the battle of Wagram, which enabled Napoleon to dictate peace from the palace of Schönbrunn, where he had once before taken up his quarters. By the treaty of Schönbrunn (October 14, 1809) he transferred the allegiance of about four millions of Austrian subjects to other rulers; but as in the following year he married Maria Louisa, the eldest daughter of Francis, it seemed probable that the two sovereigns would in future be on friendly terms. Francis was the ally of Napoleon in his war with Russia in 1812; and when, after the retreat from Moscow, France found herself confronted by Russia and Prussia, Austria at first remained neutral, and in the summer of 1813 acted as mediator. In August of the same year she joined the allies; and, like the sovereigns of Prussia and Russia, Francis accompanied his troops in the war which followed. The settlement of Europe which resulted from the final defeat of Napoleon made Francis a more powerful sovereign than he had been at the beginning of his reign; and from this time forward he lived at peace, except that he had to put down a rising in Lombardy in 1821. He was a well-meaning ruler, but had been so alarmed by the successes of the French Revolution that he detested modern ideas of government. The aspirations of his various states for some measure of independence he regarded as criminal, and in Prince Metternich he found a willing agent for his policy of stern repression. Thus a large amount of discontent was excited, which prepared serious troubles for the emperors who came after him. Francis was married four times, having by his second wife, Maria Theresa, princess of Sicily, thirteen children. He died on the 2d March, 1835, and was succeeded by his son Ferdinand.

FRANCIS, ST. (1182–1226), a well-known saint of the

Roman Catholic Church, the founder of the great order of Franciscans, was born at Assisi in the year 1182. His father was a trader in goods which he appears chiefly to have purchased in the south of France, to which he made frequent journeys; and his son was born during one of these journeys, and in consequence received from the grateful father on his return the name of Francesco. His mother had wished to call him, it is said, Giovanni or John, The youth grew up very much like any other boy of his class. He received but little learning from the priest of the parish, and does not seem to have manifested any special love for school instruction. He was by nature a merry-hearted and careless fellow, and developed early an inclination for fine clothes and street amusements with other boys of his class. His parents, indulgent to his gayeties, saw with pride the higher tastes and bright intelligence of their son, and would sometimes say to one another, "He is like the son of a prince." The father formed expectations of a successful courtly career; but the mother, seeing more into the boy's heart, would say to her neighbors, "If he lives like the son of a prince now, he shall hereafter be a child of God."

Soon a great change came to him. At the age of twenty-five Francis was seized with a severe illness. Reflections came to him on his sick-bed, and he rose from it an altered man. Henceforward, says one of his biographers, "he held that in contempt which he had hitherto held in admiration and love." The ardor of his natural character flamed forth first in the idea of military devotion, and then in a consuming spirit of self-sacrifice for the good of others. All his love of amusement and worldly display disappeared. He began to speak of poverty as his bride; and the poor and the sick and the leper became the objects of his peculiar care. He would seek out the lepers, hitherto abhorred by him as by the popular feeling, and kiss them and minister to their wants. He made a pilgrimage to Rome, and in his enthusiasm for poverty flung all he had on the altar of St. Peter's, joined himself to a troop of beggars, and gave himself up to a wandering life of almsgiving and charity. His mother guessed something of the feelings that were struggling in her son's heart; but his father, not unnaturally, was greatly concerned at his conduct. At last matters came to an open rupture between them; and the saint's severance of the parental tie for the sake of his divine mission is a significant incident in his career with all his biographers. It happened in this wise. There was an old church or small chapel of the name of St. Damian in the neighborhood of Assisi which had fallen into ruins. The spot was a favorite one with the youthful enthusiast for meditation and prayer; and one day as he sat in meditation among the ruins he seemed to hear a voice saying to him clearly, "Francis, seest thou not that my house is in ruins? go and restore it for me." To hear was to obey. The divine voice, as with some other enthusiasts, seemed to silence every other voice in his heart, even the voice of conscience. He returned home, saddled his horse, took a bale of his father's goods, and repairing to Foligno he sold both horse and goods, and rushed to the priest of St. Damian with the money to pay for the restoration of the church. The good priest was startled; his father heard with indignation of his son's conduct, and at length with blows and curses securely imprisoned him from any further freaks. But his father's harshness overshot the mark. Released by the tenderness of his mother, and summoned to restore the goods he had taken away and renounce all his patrimonial rights, the popular feeling, which had previously sided with his father against him, now turned in the youth's favor. The bishop, before whom the case finally came, discovered the youth's vocation to a religious life, and induced him to restore the value of the goods to his father. The money had been all the while lying neglected amidst the ruins of the church. This accomplished, Francis renounced all dependence upon his father, and gave himself up to the profession of a religious mendicant. "I have but one, a Father in heaven, now," he said. The people were melted to tears by his devotion, and the good bishop took him for a time under his own charge.

Gradually Francis found his full vocation, not only in a life of entire devotion and poverty for himself, but in founding an order of mendicants devoted to the service of the church. It was in the old scene of his earlier inspiration that the new idea came to him. Once more the divine voice was heard sounding in his ears: "Provide neither gold nor silver nor brass in your purses, nor scrip for your journey, neither two coats, nor yet staves." This was about the year 1208 or 1209, when, therefore, the saint was about twenty-six years of age. He was henceforth a preacher as well as an exemplar of poverty. He essayed to reproduce the picture of the divine life on earth, having not where to lay his head, going about doing good, and preaching the gospel of the kingdom. "Sell all that thou hast, and give to the poor; then thou shalt have treasure in heaven." Gradually there gathered round his cell, which he had fixed outside the town near a little church, the St. Maria degli Angeli, better known as the Portiuncula, a band of disciples as enthusiastic as himself. "Fear not," he said to them, "because you are small and seem foolish. Have confidence in the Lord who has vanquished the world. Some will receive you. Many proud will resist you. Bear all with sweetness and patience. Soon the wise and the noble will be with us. The Lord hath given me to see this. I have in my ears the sounds of the languages of all the people who will come to us,—French, Spaniards, Germans, English. The Lord will make us a great people, even to the end of the earth."

In this insignificant manner was laid the foundation of the great Franciscan order. At first there were only seven, himself the eighth, but all were animated by the same spirit, and all followed the same rule of life. As he sent them forth he said, "Go and preach two and two. Preach peace and patience; tend the wounded; relieve the distressed; reclaim the erring; bless them which persecute you, and pray for them that despitefully use you." The gospel of divine poverty was proclaimed everywhere. The spirit of self-renunciation spread by and by like wildfire, and multitudes were added to the order day by day. It may seem to our modern imagination a fantastic dream, but the gospel of St. Francis met a congenial root in the social and spiritual life of the 13th century, and rapidly grew into great results. The sanction and blessing of the papacy, however, were necessary to give the order ecclesiastical position and influence. Francis himself undertook a new journey to Rome, and suddenly appeared before the great Innocent III. as he was walking one day on the terrace of the Lateran. The startled pope dismissed the mean stranger with mingled pity and contempt; but the same night a vision came to him of the marvellous growth of a palm tree from meanness to magnificence; and, as he pondered the meaning of the vision, a divine whisper reached him that thus powerful on behalf of the church was to prove the poor man whose appearance had startled him. The natural conclusion followed. The poor man was recalled, his projects were submitted to the judgment of the Vatican, and the result was that the papal saction was formally extended to the order,—a few years before the same sanction was given to the great rival order headed by the learned and noble Dominic. The founders of the two great mendicant orders are said to have met afterwards at Rome, and again at a great meeting of the Franciscans in 1219. St. Dominic is credited with the most friendly greetings offered to his brother saint. "Thou art my companion; thy work and mine is the same." It is said also that he looked with amazement at the second meeting on the remarkable fascination which the simple-minded Francis exerted over his followers. But it is difficult to know whether these reputed *rapprochements* of the great leaders were not an afterthought of their biographers, interested in promoting the idea of the friendliness of the two powers which were destined for a time to divide the influence of the church between them.

Francis founded an order of poor sisters as well as poor brothers, known by the name of Poor Claras or Clarisses. The origin of the sisterhood is encircled in a halo of romance, such as everywhere surrounds the footsteps of St. Francis. Clara was a young lady of the neighborhood, who, either attracted by the saint's preaching, or enamored of his life of poverty, or both, resolved to devote herself to self-sacrifice as he and his companions had done. He is said to have "poured into her ears the sweetness of Christ." The result was that she forsook her home, fled to the Portiuncula, and, being first a member of the order, was then placed in a female convent. From this questionable beginning sprang the sisterhood nearly as famous in its history as the great brotherhood, and which survives till this day. There was a third order also sprung up in the course of the saint's lifetime. So marvellous were the consequences of his preaching that whole populations, it is said, wished to de-

vote themselves to consecrated poverty. But many, of course, had no real vocation to such a service, and Francis, visionary as he was, saw that the excesses of his system might prove its ruin. So he arranged to receive persons of this class into an order of what was called Tertiaries or Brethren of Penitence, who retained their social position and their customary employments in the world, while coming under general vows to abstain from worldly dissipations, such as the theatre, and otherwise to be scrupulous in all their conduct. Women were not admitted to this order without the consent of their husbands. Its members did not wear silk or other costly materials, but they had no special costume, and otherwise were at liberty. His conduct in this matter is sufficient to prove that, amidst all the apparently childlike enthusiasm of the saint, he possessed, as indeed cannot be doubted, no inconsiderable vein of shrewd discernment and of practical ability. This order was established in 1221.

Meanwhile Francis was unceasing in his personal labors. It is not easy to trace the chronology of his age or his adventures; but the same spirit of self-sacrifice, of burning ardor and spiritual industry, is everywhere conspicuous. He made long missionary journeys to Illyrica, to Spain, and even to the East, to preach to the Mahometans. He gained access to the sultan, it is said, and proclaimed to him the gospel of poverty. He was for some time in the Holy Land, and everywhere he gained multitudes of disciples. The atmosphere of miracle everywhere accompanied him, and his fame was spread throughout Christendom. Whatever we may think of many events of his life, and impossible as it is now to disentangle the legendary thread of the supernatural from its more credible texture, there are many traits of the saint's character which are in no sense doubtful, but show with a clear and life-like impress what sort of a man he was. He was passionately fond of all living things, and found his chief happiness in ministering to the needs of his fellow-creatures or the enjoyment of the lower creatures around him. His love for animals of all kinds was one of his most remarkable and winning features. Of the birds in the woods, the sheep in the fields, the ass on which he rode, the bees, the hares, the rabbits, he always spoke as his brothers and sisters. When the birds sang he said, "Our sisters, the birds, are pleasing God." A little rabbit ran to him for protection; it was received into his bosom, as one of his biographers, the famous general of the order Bonaventura, says, "as if it had some hidden sense of the perfection of the father's heart." The very wolves, which all men were afraid to encounter, were tamed by him, and came like lambs and crouched at his feet. So at least it is related in one memorable case in the legends of the "Fioretti di San Francesco" (the "Little Flowers of St. Francis,"—a collection of marvellous stories about the saint very popular in Italy to this day). There may be much in these stories that exceeds the limits of credibility; the amount of accurate fact lying beneath them can no longer be traced; but none can hesitate to believe the beautiful depth of love which they reveal in the character of St. Francis, and the fascination of personal influence which they show to have been possessed by him.

Connected with his love of nature and all living things was his poetry—for St. Francis was not only saint but poet. The stream of Italian song, so soon to swell into the full volume of Dante (1265–1321), began to flow in the rugged but touching verse of the great preacher of Assisi. In him the troubadour inspiration, dying out in its original seat, was transmuted into a spiritual minstrelsy—hardly poetry, so imperfect is its form, but a lyrical cry, as Ozanam says (in his volume *Les poëtes franciscains*, 1852), the first broken utterance of a new voice which was soon to fill the world. The most characteristic of his songs is a *Cantico delle Creature* (Song of the Creation), which has been translated in Mrs. Oliphant's interesting life of the saint.

Marvellous as is the life of St. Francis, the marvel that followed his death is more astonishing than any that marked his earthly career. It is said that when his naked body was visible after death, there were found upon it legibly impressed the marks of our Lord's passion; and the sacred story is that one day as he prayed in the solitude of Mount Averno, near the sources of the Tiber and the Arno, there appeared to him the vision as of a seraph with the arms extended and the feet as if fixed to a cross; and as he thought in his heart what the vision might mean, there were revealed on his hands and feet the signs of nails as in the Crucified One. This is well known as the famous miracle of the *Stigmata* or wounds of our Lord. There seems to be no doubt that some such marks were found on the dead body of the saint, whatever explanation the phenomena may admit of. That there was anything really supernatural in the phenomena will be so readily discredited by the modern reader that it is unnecessary we should attempt any elaborate solution of the marvel. An interesting analysis of all the facts, and such historical explanation as they seem to admit of, will be found in Hase's life of the saint, and an article, founded upon the analysis there given, in *Good Words* for 1867, p. 38 ("History of a Miracle"). St. Francis, worn out by his many labors and consuming zeal, died on 4th October, 1226.

"Of all saints," says Milman (*Hist. of Latin Christ.*, vol. iv. 268), "St. Francis was the most blameless and gentle. He was emphatically the saint of the people,—of a poetic people like the Italians." And to this day the name, the life, and the long-suffering of the popular saint live in the hearts of the poorer and devout Italians.

Of what may be called more or less original biographies of the saint there are in the well known *Acta Sanctorum* no fewer than three:—(1) The *Life* by Thomas of Celano (whose name is also associated with the composition of the famous *Dies Iræ*), written only three years after the saint's death; (2) the *Life of the Tres Socii*, three companions of the saint, written in 1247; and, lastly, (3) the *Life* by Bonaventura, Platonic schoolman and general of the order in 1263. The works of the saint have been collected and edited by Joh. de la Haye, *S. Francisci Opera*, 1739 *sq.* There is an elaborate biography by Malan, *Hist. de S. François d'Assisi*, 1841; and notices are also to be found in Helyot's *Hist. des Ordres Religieux*, t. vii., and Butler's *Lives of the Saints*. There are two recent lives, both of special interest, by the German divine, Hase, and by Mrs. Oliphant in Macmillan's Sunday Library series. See FRANCISCANS. (J. T.)

FRANCIS BORGIA, ST. (1510–1572), duke of Gandia, and afterwards general of the Jesuit order, was the son of John, duke of Gandia, a scion of the well-known family of Borgia or Borja, to which Popes Calixtus III. and Alexander VI. had belonged, and of Joanna of Aragon, daughter of Alphonso, a natural son of Ferdinand the Catholic. He was born at Gandia (Valencia), on the 10th of October, 1510, and from his infancy was remarkable for his piety. Educated from his twelfth year at Saragossa under the charge of his uncle the archbishop, he had begun to show a strong inclination towards the monastic life, when his father, wishing to divert his thoughts elsewhere, sent him in 1528 to the court of Charles V. Here he soon distinguished himself greatly by his diligence and fidelity; and on his marriage with Eleanor de Castro, a Portuguese lady of high rank, he was created by the emperor Marquis of Lombay, and at the same time received the appointment of master of the horse to the empress. He accompanied Charles on his African expedition in 1535, and also into Provence in 1536; and on the death of the empress in 1539 he was deputed to convoy the body to the burial place in Granada. Circumstances connected with the funeral obsequies there deepened in his mind long-cherished impressions as to the vanity of all worldly things, and fixed his determination to leave the court betimes, and also, should he survive his consort, to embrace the monastic life. On his return to Toledo, however, new honors were thrust upon him, much against his will; he was made viceroy of Catalonia and commander of the order of St. James. At Barcelona, the seat of his government, he lived a life of great austerity, but discharged his official duties with energy and efficiency until 1543, when, having succeeded his father in the dukedom, he at length obtained permission to resign his viceroyalty, and to retire to a more congenial mode of life at Gandia. Having already held some correspondence with Loyola, he now encouraged the recently founded order of Jesuits to the utmost of his power. One of his first cares at Gandia was to build a college for them; and on the death of Eleanor in 1546, he resolved to become himself a member of their society. The difficulties arising from political and family circumstances were removed by a papal dispensation, which allowed him, in the interests of his young children, to retain his dignities and worldly possessions for four years after he should have taken the vows. In 1550 he visited Rome, where he was received with every mark of distinction, and where he furnished the means for building the Collegium Romanum. Returning to Spain in the following year, he, with the emperor's consent, formally resigned his rank and estate in favor of his eldest son, laid aside his ducal robes,

assumed the Jesuit habit, was ordained as a priest, and entered upon a life of penance and prayer. At his own earnest request, in which he was seconded by Loyola, a proposal that he should be created a cardinal by Julius III. was departed from; and at the command of his superior he employed himself in the work of itinerant preaching. In 1554 he was appointed commissary-general of the order in Spain, Portugal, and the Indies, in which capacity he showed great activity, and was successful in founding many new and thriving colleges. In 1556, shortly after the retirement from public life of his old master Charles, Borgia had an interview with him. Charles, unfavorable to all innovation, and looking with distrust upon Jesuit pretensions, endeavored, it is said, to induce the commissary to transfer his allegiance to the older order of Jeronymites. This attempt, though unsuccessful, did not disturb the old relations of confidence and friendship between the two men, as was shown some time afterwards when Borgia was employed by Charles to conduct some delicate negotiations with reference to a project which was to secure for Don Carlos of Spain the succession to the Portuguese crown in the event of the death of his cousin Don Sebastian. On the death of Lainez in 1565, Francis Borgia was chosen to succeed him as third general of the Jesuits. In this capacity he showed great zeal and administrative skill; and so great was the progress of the society under his government that he has sometimes been called "its second founder." It is to be noticed, however, that the peculiarities which are understood to be most characteristic of the order have been derived from Loyola and Lainez rather than from Borgia, whose ideal was a pure and simple monasticism rather than a life of manifold and influential contact with the world. His death took place at Rome towards midnight on the 30th of September, 1572. He was beatified by Urban VIII. in 1624, and canonized by Clement X. in 1671, his festival being afterwards (1683) fixed by Innocent XI. for the 10th of October.

Several works by St. Francis Borgia have been published, the principal of these being a series of *Exercises* similar to the *Exercitia Spiritualia* of Loyola, and a treatise *Rhetorica Concionandi*. The *Opera Omnia* were published at Brussels in 1675. His life was written by his confessor Ribadeneira. See also Butler's *Lives of the Saints*, and the *Breviarium Romanum* (second nocturn for 10th October).

FRANCIS, St., of Paola (1416–1507), founder of the order of Minims (Ordo Minimorum Fratrum Eremitarum Fratris Francisci de Paula), was born of humble parentage at Paola in Calabria in the year 1416. His education appears to have made very little progress until he reached his thirteenth year, when, in accordance with a vow, he was taken by his father to the Franciscan convent of San Marco in Calabria. Here he learned to read, and distinguished himself by his austerities; but at the close of a probationary year he, for some reason that is not mentioned, left San Marco, and, after a pilgrimage to Assisi and Rome, retired to the neighborhood of his native town, where in a cave by the sea-shore he gave himself wholly to a hermit life, after the example of the great St. Francis, having no bed but the bare rock, and no other food than the herbs which he gathered in the neighboring wood, or which were sometimes brought to him by his friends. In the course of time he was joined by some others like-minded with himself, and the building of a chapel in 1436 is generally considered as marking the first beginning of the Minimite order. At that time, however, and for many years afterwards, they were mere "Eremites of St. Francis," and did not claim to be distinguished from other Franciscans unless by a stricter fidelity to the common principles of the order. In eighteen years the little community had increased so much in numbers and in popularity that, with the help of a friendly neighborhood, it was able to build a large church and monastery in 1454. In 1469, owing to reports which he had received, Pope Paul II. sent one of his chamberlains into Calabria to ascertain the actual condition of matters at Paola; the account brought back by him was highly favorable, and the result was that in 1474 the order of the Eremites was incorporated by a bull of Sixtus IV., and Francis appointed its first "corrector" or superior-general. In addition to the usual vows, there was a special rule, which pledged the members to the observance of a perpetual Lent. Several new convents were founded in Calabria and Sicily during the following years; and the fame of Francis for sanctity and miraculous powers increased daily. When Louis XI. of France was seized with his last illness, he despatched a special message to beg of the holy man that he would come and restore him to health. Not until he had been commanded by Pope Sixtus IV. could Francis overcome his reluctance to undertake so long a journey on so doubtful an errand; and on his arrival at Plessis-lès-Tours, in April, 1482, to the king's entreaties for his intervention to prolong his life he simply replied that the lives of kings had their appointed limits, that God's decree was unchangeable, and that for his Majesty nothing remained to be done but to resign himself to the divine will and prepare for death. At the request of Louis, Francis remained at Plessis; where he was treated with great respect by that sovereign, and also by his successor Charles VIII. In particular, the latter built two convents for the order, one near Plessis and another at Amboise; and on his triumphant arrival in Rome in 1495, he caused a third to be erected there. In 1501–2 a new and stricter constitution was granted to the order by Alexander VI., who at the same time conceded all the privileges and immunities enjoyed by the other mendicant orders, and bestowed, at the urgent request of Francis, the distinctive name of Minimi, which has ever since been retained. At the same time a lay order of Tertiaries was sanctioned, under a special rule. In 1506 the fourth vow (to observe a perpetual Lent) was made more definite and stringent in its character by Julius II. The death of Francis took place in his ninety-first year, at Plessis, on the 2d of April, 1507. He was canonized by Leo X. in 1519,—his day in the calendar being April 2 (Duplex).

A graphic incidental notice of Francis occurs in the *Memoirs* of Philip de Comines (b. vi. c. 7), who says, "I never saw any man living so holy, nor out of whose mouth the Holy Ghost did more manifestly speak." A brief sketch of his life occurs in the *Breviarium Romanum;* and his miracles and prophecies are related at considerable length by the Bollandists. Reference may also be made to Butler's *Lives of the Saints*. The order of Minims, called also Les Bons Hommes in France, Los Padres de la Vitoria in Spain, and Paulaner or Pauliner in Germany, never attained to any great prominence by the side of the great societies of Dominic and Francis of Assisi. Their cloisters never exceeded 450, and at present are very much fewer. The principal establishment is in Rome.

FRANCIS, St., of Sales (1567–1622), bishop of Geneva, and a well-known devotional writer of the Roman Catholic Church, was born at the Château de Sales, near Annecy in Savoy, in 1567. His father, known as M. de Boisy, was a Savoyard, seigneur, soldier, and diplomatist; his mother was also of a noble family and an heiress, the title De Boisy being derived from one of her hereditary possessions. Francis was their eldest son, born six years after marriage, and the child of many prayers. He received his education first at Annecy, then at the Jesuit College de Clermont in Paris, and for some time it seemed uncertain whether he should devote himself to law or the church. He studied jurisprudence, after leaving Paris, at Padua, became an advocate of the senate of Savoy, and seemed likely to gratify his father's cherished ambition for his future career. But all the while Francis's own inclinations were strongly towards the church. He had received the tonsure as early as 1578, while still a boy at Annecy, very much against his father's wishes, and the spirit shown in this early manifestation of pious self-devotion never forsook him. Notwithstanding all his father's remonstrances, he resolved to enter an ecclesiastical life; and, the office of provost or dean of Geneva becoming vacant, the dignity of this office, which was offered to him, was used as a temptation to secure the father's consent. At length M. de Boisy gave way. Francis received holy orders (1593), and entered upon his duties as dean and preacher. He possessed great gifts as a preacher, and his fame soon spread through Savoy. His sermons were marked by great simplicity and persuasiveness. "The only real point of preaching," he said, "is the overthrow of sin and the increase of righteousness;" and the principle of this saying guided him in all his sermons. He preached constantly, and in the simplest and most touching and popular words he could find. His father failed to appreciate his style of preaching, as he had failed to understand his self-denial. "I never refused to preach," Francis tells us, "on the principle of 'give to them that ask you.' My dear father used to hear the bells ringing, and asked who preached. 'Who but your son,' was often the answer. One day he took me aside and said, 'Provost, you preach

too often; even on week days the bells go, and it is always the same story, the provost, the provost! It used not to be so in my day. Sermons were much rarer. But then, to be sure, God knows those were something like sermons—full of learning well got up, more Latin and Greek in one than you stick into a dozen.'" Francis, however, knew his own mind, and was not moved. "My test of the worth of a preacher," he said, "is when his congregation go away saying not 'what a beautiful sermon,' but 'I will do something.'" A man may set forth his own learning and eloquence in a fine sermon, but the true sign of success is when his words induce people to leave off bad habits. And as he preached often, he preached briefly. "The more you say, the less people remember; the fewer your words, the greater their profit," was his motto. "When a sermon is too long, the end makes one forget the middle and the middle the beginning."

Francis was plainly a man of some originality both of mind and character, and destined to become a power in the church to which he had so passionately devoted himself. Accordingly he soon became marked out for arduous work. Savoy was at this time greatly invaded by Calvinistic "heresies." The neighborhood of Geneva—a focus for the dissemination of Protestantism—and the political and military complications arising out of the hostile relations of the duke of Savoy and the king of France, all tended to the progress of Calvinism. Chablais had been invaded, and Protestant ministers long established at Thonon and other towns. For nearly sixty years in fact this region had been Protestant, and the people by express stipulation enjoyed the exercise of the Reformed religion. A missionary of apostolic fervor and courage was required to recover the lapsed district to the Catholic faith, and all eyes were turned to the young provost of Geneva as the only man fitted to grapple with the exigences of the position. His father as usual was the obstacle. He entreated his son not to expose himself to the dangers of such a mission, but Francis felt the call within him, and calmly replied, "I cannot refuse to obey, 'Wist ye not that I must be about my Father's business?'" The result was that he gave himself for four years (1594–1598) to laborious and self-denying work in the district, often, it is said by his flattering biographers, preaching and administering the offices of his church at the peril of his life. His persuasive eloquence and the apostolic simplicity of his life were at first unsuccessful. The inhabitants of Chablais remained hardened in Protestantism. But more violent measures, some of them reflecting little honor on Francis, at length succeeded in reclaiming the district to the Catholic faith. His success in this work led the pope to believe that he might gain over Calvin's celebrated successor, Theodore Beza; and lengthened conferences were held between the Protestant teacher and the Roman Catholic missionary, but without result. In 1598 Francis was appointed coadjutor bishop of Geneva, and became the official companion, as he had long been the warm friend, of Claude de Garnier, the aged bishop who had fostered his talents and largely shaped his career. Some years after this, in 1602, he spent some time in France and especially in Paris, where his preaching attracted great crowds, and his influence was felt from the court of Henry IV. to the poor sisters at Port Royal. Before St. Cyran became the spiritual leader of Angelique Arnaud and other of the devoted band which gathered around him, Francis had given a definite direction to her thoughts and aspirations. It is not the name of Angelique Arnaud, however, but that of another celebrated pietist, who was destined to be associated with Francis de Sales. Shortly after his succession to the bishopric by the death of his aged friend, he met at Dijon Madame de Chantal, a character of rare enthusiasm and devotion, whose spirit had been greatly chastened by the loss of her husband and child. She put herself under his direction, cut off her beautiful hair, and clothed herself as a religieuse. Her good works were incessant, and she became known as the "Sainte de Monthélon." At length Francis prepared a mission for her. Submitting her saintly obedience to various tests, he intimated his decision that she was destined to establish an order for the relief of the sick and the poor, the only rules for which were to be 'charity and the love of Jesus Christ." The order was not fully established till 1610, but gradually acquired great influence. The relation of the saint to Madame de Chantal and other devout ladies has been much canvassed. There was a good deal of spiritual coquetry in it, and some of his letters to them contain doubtful sentiments; but there is no reason to doubt the purity of his character, and that his main object was to promote what he considered to be the interests of religion. He liked to be "surrounded by women," but chiefly that he might influence them for the good of the church. In 1608 Francis published his best known and most valuable work, the *Introduction à la Vie Dévote*, the circulation of which was immense. He became famous through all the Catholic world. Henry IV. sought to tempt him by a French bishopric; but he remained true to the country of his birth, and the comparatively quiet and unambitious life he was able to continue there. Loving, as all men of his temperament and religious attractiveness more or less do, to impress the force of his mind and character upon others, he yet seems to have been honestly free from vulgar ambition. He was a true priest, and found ample gratification in the diffusion of the spiritual charm and potency which radiated from his character and writings. His apparent simplicity was one of the most powerful elements of the wide influence which he exerted. Both as a preacher and as a writer a certain overweening "sweetness" may be said to be his marked characteristic,—a sweetness at times not without duplicity and a taint of cold-blooded fanaticism. Possessing singular graces of character, he was yet above all things an ecclesiastic, and had few scruples in serving the interests of his order and church. Superior to the coarser aspirations and the more commonplace ambitions of his time, he was yet often a subtle politician in the guise of a saint; and if his animating aim was to rule hearts rather than possess for himself a great position, the means by which he sought to do so were in many cases more adroit than magnanimous. He died in the end of 1622, and was canonized in 1665.

In addition to the *Introduction à la Vie Dévote* already mentioned, which has been translated into all languages, St. Francis de Sales published other works, especially a *Traité de l'Amour de Dieu*. His complete works were published in 17 vols. in 1835. There are elaborate lives of St. Francis in French by the Abbé Marsollier and Loyau d'Amboise. There is also an interesting but rather highly colored life of the saint (Sears's *Christian Biographies*, 1877) by the writer of the lives of Bossuet and Fénelon, who has likewise translated his *Spiritual Letters*. (J. T.)

FRANCIS, Sir Philip (1740–1818), a conspicuous Whig politician and, even apart from his supposed connection with the *Letters of Junius*, a powerful pamphleteer, was born in Dublin on the 22d of October, 1740. He was the only son of Dr. Philip Francis, a man of some literary celebrity in his time, who is still known by his translations of Horace, Æschines, and Demosthenes. He received the first rudiments of an excellent education at a free school in Dublin, and afterwards spent a year or two (1751–2) under his father's roof at Skeyton rectory, Norfolk, with Edward Gibbon as a fellow-pupil. In March, 1753, he entered St. Paul's school, London, where he remained for three years and a half, and became head boy. Here Henry Sampson Woodfall and Philip Rosenhagen were for some time his companions. In 1756, immediately on his leaving school, he was appointed to a junior clerkship in the secretary of state's office by Mr. Henry Fox (afterwards Lord Holland), with whose family Dr. Francis was at that time on intimate terms; and this post he retained under the succeeding administration. In 1758 he was employed as secretary to General Bligh in the expedition against Cherbourg; and in the same capacity he accompanied the earl of Kinnoul on his special embassy to the court of Portugal in 1760. In 1761 he became personally known to Pitt, who, recognizing his ability and discretion, once and again made use of his services as private amanuensis. In 1762 he was appointed to a principal clerkship in the war office, and in the same year he married Miss Macrabie, the daughter of a retired London merchant. The union was not approved by his father and led to some estrangement; but it does not appear to have been on the whole unhappy. The ten years which followed are very obscure, and a long-continued and close scrutiny by numerous and skilful investigators has led to few definite results, beyond the certain conclusion that the events of this period in the life of Francis must have been such as to have wielded a singularly commanding influence over all his subsequent conduct and career. Comparatively humble in position, and somewhat straitened in means, he had few opportunities of mingling familiarly in the society of the great; but his official duties brought

him into direct relations with many who were well versed in the politics of the time, while he all along enjoyed a peculiar intimacy with Calcraft, the rich army agent, who has been described as having been Chatham's "wire-puller and political agent as well as informant." Public events of great interest took place during these years. It was in 1763, for example, that the great constitutional questions arising out of the arrest of Wilkes began to be so sharply canvassed. It was natural that Francis, who from a very early age had been in the habit of writing occasionally to the newspapers, should be eager to take an active part in the discussion, though his position as a Government official made it necessary that his intervention should be carefully disguised. He is known to have written to the *Public Ledger* and *Public Advertiser*, as an advocate of the popular cause on many occasions about and after the year 1763;[1] he frequently attended debates in both Houses of Parliament, especially when American questions were being discussed; and between 1769 and 1771 he is also known to have been favorable to the scheme in which Calcraft and others were engaged for the overturn of the Grafton Government and afterwards of that of Lord North, and for persuading or forcing Lord Chatham into power. In January, 1769, the first of the *Letters of Junius* appeared, and the series was continued till January 21, 1772. They had been preceded by others under various signatures, which, however, are all attributed to one and the same hand. The authorship of these letters has been assigned to Francis on a variety of grounds; but it must be said that the evidence is still only of the circumstantial kind, and far from conclusive (see JUNIUS). It ought to be mentioned here that, so far as can be ascertained, no one of his intimate friends suspected him at the time to be Junius, and also that he himself in after life energetically denied the charge. There was, however, it must be added, every motive for concealment on his part, both at the time and afterwards, if he was indeed the writer of the *Letters*.

In January, 1772, the office of deputy secretary in the war office became vacant, and the post was offered by Lord Barrington to Francis, who declined it. By a curious coincidence the last letter of Junius appeared on the very day in which Anthony Chamier was gazetted deputy secretary (January 21st). Two months afterwards Francis finally left the war office. "It is my own act," he wrote to an intimate friend. "Be not alarmed for me. Everything is secure and as it should be!" In July of the same year he left England for a tour through France, Germany, and Italy, which lasted until the following December. On his return he was, according to an autobiographical fragment which has been preserved, contemplating emigration to New England, when, in June, 1773, Lord North, on the recommendation of Lord Barrington, appointed him a member of the newly constituted supreme council of Bengal, at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in October, 1774, and a long struggle with Warren Hastings immediately began. That struggle passed through three phases, during the first of which, until the death of Monson in 1776, Francis had the majority of votes in the council; afterwards, until the arrival of Wheler in December, 1777, he was continually overborne; while, during the remaining three years, forces were more evenly balanced, Hastings having on the whole the preponderance. A dispute, more than usually embittered, led in August, 1780, to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr. Francis by his experience of his private, which he had found to be void of truth and honor." A duel was the consequence, in which Francis received a dangerous wound. Though his recovery was rapid and complete, he did not choose to prolong his stay abroad. He arrived in England in October, 1781, and was received with little favor. Little is known of the nature of his occupations during the next two years, except that he was untiring in his efforts to procure first the recall and afterwards the impeachment of his hitherto triumphant adversary. It may be mentioned, as a curious coincidence at least, if nothing more, that the "bookseller's edition" of *Junius*, described on the title page as more complete than any yet published, appeared in 1783. In the same year Fox produced his India Bill, which led to the overthrow of the coalition Government. In the general election of April, 1784, Francis was returned by the borough of Yarmouth, Isle of Wight, and his first appearance in the house was made in the following July, when the financial affairs of the East India Company were under discussion. On this occasion he took an opportunity to disclaim every feeling of personal animosity towards Hastings. This did not prevent him, however, on the return of the latter, in 1785, from doing all in his power to bring forward and support the charges which ultimately led to the impeachment resolutions of 1787. Although excluded by a majority of the House from the list of the managers of that impeachment, Francis was none the less its most energetic promoter, supplying his friends Burke and Sheridan with all the materials for their eloquent orations and burning invectives. At the general election of 1790 he was returned a member for Bletchingley. In common with all English politicians he found his attention very strongly called to the events which were then occurring in France; his sympathies were strongly with the revolutionary party, and he opposed in parliament all the measures of the Government against reformers and Jacobins at home. In 1793 he supported Mr. (afterwards Lord) Grey's motion for a return to the old constitutional system of representation, and so earned the title to be regarded as one of the earliest promoters of the cause of parliamentary reform. He rendered further services to the same cause by repeated vindications of the Society of the Friends of the People in the days of its unpopularity. The acquittal of Hastings in April, 1795, again disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, and it seemed as if the great ambitions of his life were about to be realized when the Whig party came into power into 1806. His disappointment was great when the governor-generalship was, owing to party exigences, conferred on Sir Gilbert Elliot (Lord Minto); he declined, it is said, soon afterwards the government of the Cape, but accepted a knight companionship of the order of the Bath. Though re-elected for Appleby in 1806, he failed to secure a seat in the following year; and the remainder of his life was spent in comparative privacy. In 1814 he married his second wife, Miss Emma Watkins, who long survived him, and who has left voluminous manuscripts relating to his biography. He died on the 23d of December, 1818.

Among the later productions of his pen were, besides the *Plan of a Reform in the Election of the House of Commons*, a pamphlet entitled *Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie* (1810), and a *Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway* (1814). His *Memoirs, with Correspondence and Journals*, commenced by the late Joseph Parkes, and completed and edited by Mr. Herman Merivale, were published in two volumes in 1867. They help the reader to form a tolerably vivid conception of the man, and show that in his domestic relations he was exemplary, and that he lived on terms of mutual affection with a wide circle of friends. They indicate at the same time, however, that he was far from incapable of vindictiveness, dissimulation, and treachery. His biographers are firmly convinced of his identity with Junius, and bring a great body of circumstantial proof in support of their belief.

FRANCISCANS. The Franciscan orders include the three orders of the Minorites, and all the less important associations who trace their rule to Francis of Assisi. The three orders of the Minorites, or Franciscans proper, include (1) the Minorite friars, properly so-called, under a succession of generals of the whole order from the foundation; (2) the order of the Poor Ladies or Poor Clares—the Franciscan nuns; (3) the order of Penitent Men and Women, which includes (*a*) all those who dwell in

[1] A letter in the *Public Ledger* (March, 1763) signed "One of the People," in which the popular cause is supported in a contest that had arisen between the public and the proprietors of Drury Lane and Covent Garden theatres, is among the earliest known productions of his pen. There is strong evidence that he was the author of the "Candor" pamphlet (September, 1764), in which the verdicts obtained by the Government against the printers of the *North Briton* for libel in "No. 45" are condemned. With regard to the "Anti-Sejanus" letters (January and February, 1766), written in condemnation of the American policy of the Rockingham ministry, Parkes affirms that "the most sceptical cannot doubt that they emanated from his pen;" but Merivale brings evidence to show that, if so, he must at least have had colleagues in writing them. The communication in the *Public Advertiser* (June, 1768), signed "A Friend to Public Credit," is undoubtedly attributable to him. There is some likelihood also that sundry letters to the *North Briton* and other periodicals (1768-70), copies of which have been found among his papers corrected and punctuated by himself, may have been his contributions.

Franciscan cloisters and keep the third rule, (*b*) those who live in cloisters of their own, keeping the third rule, and (*c*) the Tertiaries properly so-called. All these three orders of Friars, Nuns, and Tertiaries are more or less under the jurisdiction of the general-minister of the Francisan order.

I. The Minorite friars, or the first order, are divided into two "families," Cismontana, or convents in Italy, Germany, Hungary, Poland, Syria, and Palestine, and Ultramontana, or convents in France, Spain, the Low Countries, Saxony, the Islands of the Mediterranean, Africa, Asia, and the Indies—the one ruled directly by the minister-general, and the other by a commissary-general. Each family is divided into provinces ruled over by a provincial. The Cismontane has sixty-six provinces, and the Ultramontane has eighty-one. A province is the union of a certain number of convents under a chief directly responsible to the minister-general. Besides provinces the order originally contained *vicarates* and *custodia*. The vicarates were a number of convents united together, but too few to be counted a province. The custodia were at first subdivisions of provinces, but since Leo X. the custodia are like the old vicarates, and are governed by a vicar or custos directly responsible to the minister-general. The convents of the order *in partibus infidelium* are governed by prefects. The minister-general is chosen in full chapter for a term of six years, and if he dies or removes to a higher office during his term, the "discreet perpetual fathers" choose a deputy for the remainder of the term. The minister-general is chosen from the two families alternately, and the chapter at the same time elects a commissary-general for the other family.

The rule originally prescribed by St. Francis was very strict, and, rigidly enforced, would have made all the members of the order pious beggars. This was the founder's idea, but when the order became popular it was found that few of its members could act up to its requirements; and even in the life-time of the founder attempts were made to relax them. The relaxations sanctioned by the decrees of popes and by general usage were repeatedly fought against by small but zealous minorities, and these struggles gave rise to various divisions in the order. Since the time of Leo X. and his union bull these divisions have been reduced to three,—the Observants, the Conventuals, and the Capuchins,—all of whom belong to the first order of the Franciscans; and they are the survivals of a much more numerous division. The Observants are supposed to keep the rule of Francis with some strictness, and they take the first rank among the Franciscans; their minister-general has pre-eminence. The Conventuals follow the rule of Francis with certain relaxations permitted by successive popes. Their general has to be confirmed by the great minister-general, but otherwise they are independent. Since 1528 the Capuchins have had an independent general under he minister-general.

1. *The Observants.*—The relaxation of the rule of Francis and attempts at reformation to the original simplicity and strictness date from the time of Elias, successor as minister-general to Francis himself. Some of these reforms were unsuccessful, and only resulted in small schisms condemned by the general and by the pope; others were successful, and resulted in the formation of separate congregations more or less independent, until they were all abolished or rather brought together under one rule by Leo X. The *Cæsarins* were the followers of Cæsarinus of Spires, who revolted against the relaxations and innovations of Elias. After varying fortunes the reformers were punished as rebels. They gradually returned to the ranks of the order, and ceased to exist separately in 1256. The *Celestines* were the followers of Peter of Macerata, who called himself Liberatus, and Peter of Fossombrone, called Angelus, from his frequent fellowship with angels. They taught and professed a life of the strictest poverty and solitude, and were permitted to live separately from the rest of the order by Pope Celestine V. in 1294. The permission was recalled by later popes, and after many struggles the Celestine hermits were reckoned schismatics and heretics (see CELESTINES). From them came the Fratricelli (see FRATRICELLI). The *Congregation of Narbonne*, the Spirituales, were mainly followers of Peter John de Oliva. They were really a branch of the Celestines settled at Narbonne; but their special grievances were that their laxer brethren did not wear the clothes prescribed by Francis,—their robes were too long and too rich, and their hoods too large,—and that they accepted presents of wine and corn during the vintage and harvest. After some struggles they forced on a controversy in 1282, and were finally condemned by John XXII. at Vienna in 1312. They refused to submit, and were pronounced schismatic in 1318. The *Clarenins* were a revival, in 1302, of the Celestine hermits under Angelus of Cordova. They fought for recognition and existence down to 1581. The *Congregation of Philip of Majorca* arose in 1308. They were refused recognition, but struggled on only to disappear among the fanatical schismatics of the period. The reform of John of Vallées and Gentilis of Spoleto was occasioned by a further relaxation of the rule in 1336, sanctioned by Pope Benedict XII. Their fight for existence lasted almost forty years.

These six attempts to return to the original rule of St. Francis, and to follow in the letter and spirit his principles of a religious life, were all unsuccessful. The historians of the order ascribe the failures to the rashness of the reformers or their followers, but the real cause was the utter incompatibility of the rule of Francis with social life in any form. Any thorough-going return to the primitive rule was impossible, but many partial reforms were attempted. The aim of each reformer was to reconstruct the society, or at least to found a small society, which would be so independent of the rules and officials of the Franciscan order as to be free from interference with their endeavors to obey the rule of Francis in their own way. Some of these reforms achieved a very considerable degree of independence, and lasted for a long time. They were all, nominally at least, brought under the common government of the order by the famous union bull of Pope Leo X. Of these reforms the most important are the following:—

The Soccolantes (named from wearing a wooden sandal), were founded by Paul of Foligny in 1368, noted from his fourteenth year for his enthusiastic piety. This is the most important, because it started with the principles of the earlier unsuccessful reforms, and succeeded because it professed unconditional submission to the pope. Paul and his companions showed all the idiosyncrasies of Francis: their cells were full of frogs, and their beds of serpents; they rejoiced in ill health, and nausea at the sight of food was esteemed a sign of the complete mortification of the body. They obtained permission, and retained it against many attempts at deprivation, to live in independence of the ordinary officials of the order. Their reform became successful and spread, and when Leo X. issued his bull of union they were sufficiently numerous to impose their name (*Observantes*) on one of the great divisions of the reorganized order. At the first they held disputations with the Fratricelli and Beghards regarding the principles of Francis, for these heretics with great justice declared that they were more true to the Christian ideal of Francis than the professed followers of the saint. The only argument the Observants could adduce against their opponents was that Francis had made unconditional submission to the pope part of his ideal.

The congregation of Villacrezes was founded by Peter of Villacrezes, in the convent of Our Lady of Salceda in Castile, about 1390. His principles were very like those of Paul of Foligny, but were even more strictly enforced. The brethren were obliged to wear the scantiest and coarsest raiment, and to content themselves with the rest necessaries of life. The independence of the congregation was finally secured at the council of Constance. (*Cf.* Mendoza, *Hist. del Monte Celia de nuestra Señora de la Salceda.*)

The Congregation of Collette, from the nun Collette, noticed below.

The congregation founded by Amadeus of Assisi obtained independence in 1469 and 1471; it was never very strong, labored under suspicion of heresy, refused to submit to the bull of Leo X., and was finally suppressed by Pius V.

The congregation of Philip Berbegal took its rise from attempts of Martin V. to reform the order in 1430. Nominally suppressed in 1433, it reappeared under another name (the Neutrals), obtained recognition, but was finally suppressed in 1463.

The Caperolani, or followers of Peter Caperole, were for a short time independent, and then were reunited with the Observants. Two famous preachers, Anthony of Castel St. Jean and Matthew of Tivoli, held out and gathered around them a new congregation, which for long refused to submit itself to the order.

More important, however, than any of these reforms, save the first, were the series of national reformatory movements within the order, which produced in Spain the Bare-footed Friars under the leadership of John of Guadaloupe, in Italy the Riformati led by Stephen Molina, and in France the Récollets. These congregations arose to embody the reforms suggested by John of Puebla, and survived Leo's bull of union. Lapse of time brought relaxations, and these led again to a reaction

which produced the reform of Peter of Alcantara, who named his fellows The Brethren of the Strictest Observance. Peter obtained a species of independence for his convents. They were under the rule of the general of the order, but not of the provincials. From this congregation arose a further reform under John of Pasehase and Jerome of Lanza, which, after some years of independent life, reunited with the congregation of Peter of Alcantara.

Most of these reforms were brought together by the bull of Leo X., and are merged under the general name of Observants.

2. The *Conventuals* included, at the time of Leo X., all the Franciscans who kept the rule in a relaxed form, and had not been influenced by the various attempts at reformation. They claimed to be *the* Franciscan order, and in fact at the time were so. Now they are only one of the great divisions of the order. An attempt was made after the council of Trent to reform the Conventuals, and a congregation of Reformed Conventuals was founded, but it did not exist very long.

3. The *Capuchins* exist as an independent congregation, and do not take rank with the Observants and Conventuals. They owe their origin to Matthew of Bassi, a Franciscan of the family of Observance, who had conscientious scruples about the shape of his hood or capuce. It was revealed to him in visions that St. Francis had worn a long pointed hood, and he began to wear one of the revealed pattern. Others began to copy it. They were persecuted by their fellows, strove for freedom, and at length got it. In 1536 Paul III. formally recognized them under the title of Capuchins of the order of the Minorites, but ordained that their vicar-general or chief was to be confirmed by the general of the Conventuals, and that they were to march under the cross of the Conventual Minorites in religious processions. In 1619 Paul V. removed these restrictions. They now have their own cross and choose their own chief quite independently, and he is called general, not vicar-general. See CAPUCHINS.

II. The Franciscan nuns owed their origin to Clara, a noble maiden of Assisi. Born in 1193, she left her home in 1212, fled to the Portiuncula to Francis, and refused to return. The same year she gathered a company of ladies, including her three younger sisters, and founded the order of Franciscan nuns. The order spread rapidly through Italy, France, Spain, Germany, and Bohemia. In 1220 Cardinal Hugolin gave them a rule of life taken from the rule for the strictest sect of the Benedictine nuns, with some special observances. Four years later Francis gave them a written rule, which was approved of by Gregory IX. and by Innocent IV.

The rule of Hugolin compelled the nuns among other things to fast every day, to abstain at all seasons on Wednesdays and Fridays from wine and soup, and to content themselves on those days with some fruits or raw herbs, to fast also on bread and water thrice a week during Lent and twice during Advent. They were also to keep perpetual silence, to be broken only by the permission of the superior. They were to wear two tunics, a mantle and scapulary, besides a hair shirt. The rule of Francis was not so strict; he did not oblige them to fast on bread and water during certain seasons, and there were other relaxations. These two rules gave rise to disputes and divisions, and Pope Urban IV. gave the sisters a third rule which was less strict than either. The result was that several convents adhered to the first and strictest rule; that of the reform of Collette, a French sister, adhered to the second rule, that of Francis; while the large proportion of the nuns followed the new rule of Urban.

The Capuchin movement within the Franciscan order also affected the Minorite nuns, and the Capuchin nuns soon became a large and prosperous community. The only other important reform was that set in motion by Peter of Alcantara. The sisters who followed him are called the Poor Clares of the Strictest Observance. They take the vow of perpetual silence.

III. The Tertiaries consist of lay brethren and sisters in the Franciscan monasteries, confraternities who keep the third rule of St. Francis, and men and women living in society who have taken the third rule. The Tertiaries of the begging monks have become so famous that many are disposed to trace their origin to Francis and Dominic, but the class of penitents existed in connection with other and older orders. The third rule was intended to suit the requirements of all those who wished to live a higher religious life, and who could not from their circumstances embrace the monastic life. It is said that the origin of the Franciscan Tertiaries dates from Francis preaching at Canari, a small town near Assisi, where the whole population wished *en masse* to enter the Franciscan order and desert their life and duties in society. Francis refused to permit this, but to assist them framed a third rule to serve as a religious guide. Its provisions resemble the rules commonly found in pious books with which the present ritualistic movement has made us familiar, and the associations of Tertiaries may be compared with the guilds now found in connection with many High Church congregations. These Tertiaries believed that they were imitating not Christ but his early disciples; they had to spend some time in novitiate, and then vowed obedience to the third rule, which enjoined that they were to wear poor clothing of an unobtrusive color, without worldly ornament of any kind. It forbade them to bear arms save for the defence of the church or their country. It prohibited attendance at fêtes, balls, dancing parties, and the theatre. It forbade meat on Monday, Wednesday, Friday, and Saturday. It enjoined fasting at Lent and Advent, and at other times only two meals a day. The hours of devotion and the devotional exercises were prescribed. Tertiaries were bound to attend mass and preaching at least once a month, to go to confession and holy communion at least thrice a year, and to attend the funerals of their fellows. This third order was very successful, but it is worth noticing that the common people, after the first burst of enthusiasm, seemed unable to distinguish the Tertiaries from the Fratricelli and Beghards, who professed a somewhat similar mode of life, and had been condemned by various popes.

At some period of their existence, when it is difficult to say, many of the Tertiaries began to practise the monastic life, and to take the vow of chastity in addition to the third rule. Convents of the third rule were in existence in the 15th century, and in 1433 brethren living under this rule were permitted to choose a general. The earlier bulls permitting such confraternities were at first generally addressed to penitents living in particular countries, and the divisions of the brethren take generally a local name. There were, for example, the religious penitents of the third order of St. Francis of the regular observance in Italy, in Sicily, Dalmatia, and Istria, and in the Low Countries; these three were united in the congregation of Lombardy. There were besides the congregations of Germany, Spain, Portugal, and France. Congregations were also formed to observe the rule with complete and literal strictness. The Tertiaries included women as well as men, and these also began to take a special vow of chastity and live in cloisters. One branch of these includes the lay sisters in the ordinary convents of the Poor Clares, who devote themselves to menial work. Their foundress was Elizabeth of Hungary. Another branch was founded by Angeline of Corbaro, and has convents of its own. There are also the Gray Sisters, the Recollectines, and several other congregations, who live in cloisters under regular government, but practise the third and not the second rule. From the beginning of the movement the Tertiaries were charged to take special care of the poor, the sick, and the aged; and several confraternities, both of men and of women, have been formed, who live under the third rule, and devote themselves to hospital work.

Besides these three orders of Friars, Nuns, and Tertiaries, the Franciscans may also be said to include one or two orders of minor importance which trace their origin to Francis,—such, for example, as the Chevaliers of the Order of the Immaculate Conception of the Blessed Virgin, and the Archiconfraternity of the Stigmata of St. Francis, but they are of minor importance.

The Franciscan soon became one of the most important of the mediæval monastic orders. It had a peculiar character, and attracted minds of the sympathetic mystical cast. This led to its curious connection with many of the mediæval heretical sects. The Franciscan theology was also peculiar. It had the same Pelagian characteristics that distinguish the modern Jesuit theology, which has done little more than develop the Franciscan ideas on the immaculate conception, the doctrines of freedom and grace, etc. During the Middle Ages, the Franciscans, however, furnished many strong opponents to the papal theology and ecclesiastical claims. The order has produced a long array of distinguished theologians and churchmen,—Bonaventura, Alex-

ander of Hales, John Duns Scotus, and William of Occam were all Franciscans. Wadding, the great historian of the Franciscans, has filled a folio volume with names of distinguished members of the order.

FRANCISQUE. Jean François Millet (*c.* 1644–1680), commonly called Francisque, was born at Antwerp about 1644, and is generally classed amongst the painters of Flanders on account of the accident of his birth. But his father was a Frenchman, a turner in ivory of Dijon, who took service with the prince of Condé, and probably returned after a time to his native country. He remained long enough in Antwerp to apprentice his son to an obscure member of a painter family called Laurent, pupil of Gabriel Franck. With Laurent Franck Francisque left Antwerp for Paris, and there settled after marrying his master's daughter. He was received a member of the Academy of Painting at Paris in 1673, and after gaining consideration as an imitator of the Poussins he died in 1680, bequeathing his art and some of his talents to one of his sons. Francisque probably knew, as well as imitated, Nicolas Poussin, Gaspar Dughet, and Sebastian Bourdon; and it is doubtless because of his acquaintance with these travelled artists that, being himself without familiarity with the classic lands of Italy and Greece, he was able to imagine and reproduce Italian and Arcadian scenery with considerable grace and effectiveness. It is indeed surprising to observe, even at this day, how skilfully he executed these imaginary subjects, enlivened them with appropriate figures, and shed over them the glow of a warm yet fresh and sparkling tone. Unhappily time has been unkind to Francisque. Twelve of his most important landscapes, which remained in the palace of the Tuileries, were destroyed by fire quite recently; and though many of his pieces may still be found catalogued in Continental and English collections, others in great number remain unknown and unacknowledged. In England there are specimens of Francisque in the galleries of the duke of Devonshire, and Earls Dudley and Suffolk. Abroad, most of his known works are in public museums. It often happens that his name is appended to pictures by Jean François, his son.

Jean François Millet, the younger, was born in Paris, and was made a member of the Academy of Painting at Paris in 1709. He died in 1773. He is not quite so independent in his art as his father; but he had clever friends, and when he wanted figures to his landscapes, he consulted Watteau, and other followers of the "court shepherdess" school. But on the whole Jean François the younger's work is often lost in that of his father, and it is difficult to point to any picture by him except that in the museum of Grenoble, which is prettily adorned with Watteau's figures.

FRANCK. The name of Franck has been given indiscriminately but improperly to painters of the school of Antwerp who belong to the families of Francken and Vranex (see FRANCKEN and VRANEX). One artist truly entitled to be called Franck is Gabriel, who entered the guild of Antwerp in 1605, became its president in 1636, and died in 1639. Gabriel Franck formed a great number of pupils, amongst whom we notice Abraham Genoels the elder, and Laurent Franck, the master of Francisque. But none of his works are now to be traced.

FRANCK or FRANK, SEBASTIAN (*c.* 1500–1543), not unfrequently called by the Latinized form of his name *Francus*, an important German writer of the Reformation period, was born about 1500 at Donauworth, and regularly styled himself Franck of Wörd. Of his early years nothing is known except by inference. It appears that he studied at Heidelberg, and about 1524 was ordained a Roman Catholic priest. In 1528 he married Ottilia Behaim at Nuremberg; and the same year he produced his German translation of Althamer's *Diallage, or Reconciliation of the Contradictions of the Scriptures*, and wrote a treatise against the *Horrible Vice of Drunkenness*. Two years later appeared, with an introduction by Luther, his translation of a *Chronicle and Description of Turkey, written by a Transylvanian who had been Twenty-two Years in Turkish Captivity*. In 1531 he was in Strasburg, and published his *Chronika, Zeitbuch, und Geschichtbibel*, one of the first German works in which an attempt was made to give a survey of universal history. From Strasburg he removed to Esslingen; and there during 1532 and 1533 he attempted to support himself by soap-boiling, but found it on the whole an unprofitable occupation. In hope of a better market for his wares he went to Ulm, where in 1534 he received the freedom of the city. For some time he remained peacefully printing his books, but on the publication of his *Parodoxa* his privileges were withdrawn, and he was ordered to depart. A promise to submit his writings to censure procured a temporary reprieve of the sentence, but in 1539 he was finally banished, and from that time he appears never to have settled long in one place. He was engaged as a printer and publisher at Basel when he died, in 1543 or 1545. Besides the works already mentioned, he wrote also a collection of proverbs (*Spruch-Wörter*) in 1532, which appeared in fuller form in 1591, a *Germaniæ Chronicon*, 1538, and the *Guldin Arch* or *Arca Aurea*, 1538, a collection of Scripture doctrines with proof passages, not only from the Bible itself, but also from pagan writers. Franck's position as a thinker was a peculiar one. Though associated at first with the Reformers, he soon showed that he was out of sympathy with their dogmatic tendencies, and at length was branded by Luther as a "devil's mouth." He was naturally inclined to subjectivity and mysticism, and may to a certain extent be regarded as a forerunner of modern German idealism. His religion was practically pantheistic, and tended to foster a spirit of tolerance that found good in everything. Amid the bitter controversies of contending sects it was rare to find a professed theologian maintaining that the true church consisted of "all pious and good-hearted men in all the world, even among the heathen." As an historian, while still credulous enough to believe in the Trojan myths of the Middle Ages, he displayed a remarkably modern spirit in the attention he gave to social conditions. The first part of his *Chronicon*, etc., contains the history of antiquity, the second includes the period from Christ to Charles V., and the third gives account of the popes, councils, heretics, ceremonies, etc. His German style is plain, vigorous, and idiomatic, and ranks him high among the founders of German prose.

K. am Ende, *Nachlese zu Franck's Leben und Schriften*, Nuremberg, 1796; Hagen, *Geist der Reformatoren und seine Gegensätze*, Erlangen, 1844; Heinrich Merz in Herzog's *Real Encyclopädie für Prot. Theol.*, 1855; Bischof, *Sebastian Franck und die Deutsche Geschichtschreibung*, Tübingen, 1857; Hase, *Sebastian Franck von Wörd der Schwarmgeist*, Leipsic, 1869; Latendorf in his edition of *Sebastian Franck's erste namenlose Spruchwörtersammlung von Jahre 1532*, Posneck, 1876; and a valuable review of this last work in the *Jena Lit. Zeitung*, 1877, No. 22. A critical catalogue of the whole literature of the subject appeared in Birlinger's *Alemannia*, 1876.

FRANCKE, AUGUST HERMANN (1663–1727), an influential German philanthropist and theologian, was born on the 22d of March, 1663, at Lübeck, where his father, a doctor of laws, at that time held a professional appointment. He was educated, chiefly in private, at Gotha (to which his family had removed in 1666), and afterwards at the universities of Erfurt, Kiel, and Leipsic. During his student career, he busied himself specially with the Hebrew and Greek languages; and in order to acquire the former more thoroughly, he for some time put himself under the instructions of Rabbi Ezra Edzardi at Hamburg, at whose instance he is said to have read through the entire Hebrew Bible seven times within a year. He graduated at Leipsic in 1685, but, having found employment as a "privat-docent," did not quit the university until the end of 1687. During the last year of his residence he had, by the help of his friend P. Anton, and with the approval and encouragement of Spener, who was at that time coming into notice, originated the afterwards famous collegium philobiblicum, at which a number of graduates were accustomed to meet for the regular and systematic study of the Bible. He next passed a number of months at Lüneburg as assistant or curate to the learned and pious superintendent Sand-

hagen, and there his religious life was remarkably quickened and deepened. His own account of his experience at that crisis in his life, and of the influence of the particular text (John xx. 31) to which he believed he owed his conversion, is very interesting and characteristic. On leaving Lüneburg, he spent some time in Hamburg, where he was engaged as a teacher in a private school, and there also he considered himself to have acquired some experience which proved invaluable in after life. After a long visit to Spener, who was at that time in Dresden, and who encouraged him in the plans he had formed, he returned to Leipsic in the spring of 1689, and began to give Bible lectures of an exegetical and practical kind, at the same time resuming the collegia philobiblica of earlier days. He rapidly became very popular as a lecturer; but the peculiarities of his teaching almost immediately aroused a violent opposition on the part of the university authorities; and before the end of the year he was, on the ground of his alleged pietism, interdicted from lecturing. Thus it was that Francke's name first came to be publicly associated with that of Spener, and with one of the most fruitful church movements of the 17th century. Although, however, the majority of those claiming to be orthodox chose to regard the pietists as a new and dangerous sect, it must be remembered that neither Spener nor Francke taught in any spirit of sectarianism or with any consciousness of antagonism to any of the doctrines of the Lutheran Church. Loyal churchmen, they were distinguished from other Lutherans simply by their readiness to subordinate mere confessional orthodoxy to the interests of spiritual religion and practical morality, and also by the unusual earnestness with which they insisted on the necessity of conversion, and of the appearance of certain symptoms of a moral and spiritual change, before any one could rightly lay claim to the Christian name. The pietism of Francke, at all events, was quite as compatible with churchliness as was the methodism of Wesley or the evangelicalism of Simeon; and it is well known that neither of these two men desired to set up a sect against the church. Prohibited from lecturing in Leipsic, Francke in 1689 found work at Erfurt as "deacon" of one of the city churches. Here his evangelistic fervor attracted multitudes to his preaching, but at the same time excited the jealousy of his less zealous colleagues as well as the antipathy of the Catholic section of the population; and the result of their combined opposition was that after a ministry of fifteen months, he was, in September, 1691, banished from the town by the civil authorities. The same year witnessed the expulsion of Spener from Dresden. In December Francke received and accepted an invitation to fill the chair of Greek and Oriental languages in the new university of Halle, which was at that time being organized by the Elector Frederick III. of Brandenburg; and at the same time, the chair having no salary attached to it, he was appointed minister of the parish of Glaucha in the immediate neighborhood of the town. Here, for the next thirty-six years, he continued to discharge the twofold office of pastor and professor with rare energy and success. Besides preaching on Sundays, with an eloquence and earnestness and depth that attracted and held together a large congregation, he found time for many week day meetings for edification, and was unwearied in the work of catechising the young and of giving spiritual direction to those who sought his private advice. At the very outset of his labors, he had been profoundly impressed with a sense of his responsibility towards the numerous outcast children who were growing up around him in ignorance and crime. After a number of tentative plans, such as that of gathering them together once a week at the parsonage, and that of paying their school fees, he resolved in 1695 to institute what would be called in this country a ragged school, relying for funds upon the charity of the benevolent public. A single room was at first sufficient for the needs of the institution; but within a year it was found necessary to purchase a house, to which another was added in 1697. In 1698 there were 100 orphans under his charge to be clothed and fed, besides 500 children who were taught as day scholars. The later statistics of the many and various educational institutions of Halle which owe their origin to him will be found in vol. vii. p. 586. The principles there indicated were consistently applied in his university teaching. Even as professor of Greek he had given great prominence in his lectures to the study of the Scriptures; but he found a much more congenial sphere when, in 1698, he was appointed to the chair of theology. Yet his first courses of lectures in that department were on Old and New Testament introduction; and to this, as also to hermeneutics, he always attached special importance, believing that for theology a sound exegesis was the one indispensable requisite. "Theologus nascitur in scripturis," he used to say; but during his occupancy of the theological chair he lectured at various times upon other branches of the science also, according to the custom still usual in Germany. Amongst his colleagues were Anton, Breithaupt, and Joachim Lange—men like-minded with himself. Through their influence upon the students, Halle became a centre from which pietism, as it was called, became very widely diffused over Germany; but while in some quarters the new light was welcomed and cherished, in others every effort was made to suppress it. Thus, while Frederick William I. of Prussia is said to have gone so far as to issue an edict forbidding that any one should receive a cure of souls in his dominions who had not studied in Halle for two years, and received from the faculty there satisfactory certificates as to his status gratiæ, legislative enactments were elsewhere frequently directed against the Halle school. It ought to be borne in mind with reference to these that Francke cannot fairly be held responsible for the separatistic and perfectionist and chiliastic tendencies which are now most commonly associated with the pietistic name. He died at Halle on the 8th of June, 1727.

His principal contributions to theological literature were—*Manuductio ad Lectionem Scripturæ Sacræ* (1693); *Prælectiones Hermeneuticæ* (1717); *Commentatio de Scopo Librorum Veteris et Novi Testamenti* (1724); and *Lectiones Paræneticæ*, (1726–36). The *Manuductio* was translated into English in 1813, under the title *A Guide to the Reading and Study of the Holy Scriptures*. An account of his orphanage, entitled *Segensvolle Fuss-stapfen*, etc. (1709), which subsequently passed through several editions, has also been partially translated, under the title *The Footsteps of Divine Providence; or, The Bountiful Hand of Heaven defraying the Expenses of Faith*. See Guerike's *A. H. Francke* (1827), which has been translated into English (*The Life of A. H. Francke*, 1837); and Kramer's *Beiträge zur Geschichte A. H. Francke's* (1861), and *Neue Beiträge* (1875).

FRANCKEN. Eleven painters of this family cultivated their art in Antwerp during the 16th and 17th centuries. Several of these were related to each other, whilst many bore the same Christian name in succession. Hence unavoidable confusion in the subsequent classification of paintings not widely differing in style or execution. When Franz Francken the first found a rival in Franz Francken the second, he described himself as the "elder," in contradistinction to his son, who signed himself the "younger." But when Franz the second was threatened with competition from Franz the third, he took the name of "the elder," whilst Franz the third adopted that of Franz "the younger." It is possible, though not by any means easy, to sift the works of these artists. The eldest of the Franckens, Nicholas of Herenthals, died at Antwerp in 1596, with nothing but the reputation of having been a painter. None of his works remain. He bequeathed his art to three children. Jerom Francken, the eldest son, after leaving his father's house, studied under Franz Floris, whom he afterwards served as an assistant, and wandered, about 1560, to Paris. In 1566 he was one of the masters employed to decorate the palace of Fontainebleau, and in 1574 he obtained the appointment of court painter from Henry III., who had just returned from Poland and visited Titian at Venice. In 1603, when Van Mander wrote his biography of Flemish artists, Jerom Francken was still in Paris living in the then aristocratic Faubourg St. Germain. Among his earliest works we should distinguish a Nativity in the Dresden Museum, executed in co-operation with Franz Floris. Another of his important pieces is the Abdication of Charles V. in the Amsterdam Museum. Equally interesting is a Portrait of a Falconer, dated 1558, in the Brunswick Gallery. In style these pictures all recall Franz Floris. Franz, the second son of Nicholas of Herenthals, is to be kept in memory as Franz Francken the first. He was born about 1544, matriculated at Antwerp in 1567, and died there in 1616. He, too, studied under Floris, and never settled abroad, or lost the hard and gaudy style which he inherited from his master. Several of his pictures are in the Museum of Antwerp, one dated 1597 in the Dresden Museum represents Christ on the road to Golgotha, and is

signed by him as D. ō (Den ouden) F. Franck. Ambrose, the third son of Nicholas of Herenthals, has bequeathed to us more specimens of his skill than Jerom or Franz the first. He first started as a partner with Jerom at Fontainebleau, then he returned to Antwerp, where he passed for his guild in 1573, and he lived at Antwerp till 1618. His best works are the Miracle of the Loaves and Fishes and the Martyrdom of St. Crispin, both large and ambitious compositions in the Antwerp Museum. In both these pieces a fair amount of power is displayed, but marred by want of atmosphere and shadow, or by hardness of line and gaudiness of tone. There is not a trace in the three painters named of the influence of the revival which took place under the lead of Rubens. Franz Francken the first trained three sons to his profession, the eldest of whom, though he practised as a master of guild at Antwerp from 1600 to 1610, left no visible trace of his labors behind. Jerom the second took service with his uncle Ambrose. He was born in 1578, passed for his guild in 1607, and in 1620 produced that curious picture of Horatius Cocles defending the Sublician bridge which still hangs in the Antwerp Museum.. The third son of Franz Francken the first is Franz Francken the second, who signed himself in pictures till 1616 "the younger," from 1630 till his death "the elder" F. Francken. These pictures are usually of a small size, and are found in considerable numbers in Continental collections. Franz Francken the second was born in 1581. In 1605 he entered the guild, of which he subsequently became the president, and in 1642 he died. His earliest composition is the Crucifixion in the Belvedere at Vienna dated 1606. His latest compositions as "the younger" F. Francken are the Adoration of the Virgin (1616) in the Gallery of Amsterdam and the Woman taken in Adultery (1628) in Dresden. From 1616 to 1630 many of his pieces are signed F. Francken; then come the Seven Works of Charity (1630) at Munich, signed "the elder F. F.," the Prodigal Son (1633) at the Louvre, and other almost countless examples. It is in F. Francken the second's style that we first have evidence of the struggle which necessarily arose when the old customs, hardened by Van Orley and Floris, or Brueghel and De Vos were swept away by Rubens. But F. Francken the second, as before observed, always clung to small surfaces; and though he gained some of the freedom of the moderns, he lost but little of the dryness or gaudiness of the earlier Italo-Flemish revivalists. F. Francken the third, the last of his name who deserves to be recorded, passed in the Antwerp guild in 1639, and died at Antwerp in 1667. His practice was chiefly confined to adding figures to the architectural or landscape pieces of other artists. As Franz Pourbus sometimes put in the portrait figures for Franz Francken the second, so Franz Francken the third often introduced the necessary personages into the works of Pieter Neefs the younger (museums of St. Petersburg, Dresden, and the Hague). In a Moses striking the Rock, dated 1654, of the Augsburg Gallery, this last of the Franckens signs D. ō (Den ouden) F. Franck. In the pictures of this artist we most clearly discern the effects of Rubens's example.

FRANÇOIS DE NEUFCHÂTEAU, Nicolas Louis, Count (1750–1828), a French statesman and poet, was born at Saffais, in the district of Meurthe, 17th April, 1750. He studied at the college of Neufchâteau in the Vosges, and at the age of fourteen published a volume of poetry which obtained the approbation of Rousseau, and secured for its author so much *éclat* that Neufchâteau conferred on him its name, and he was elected member of some of the principal academies of France. In 1783 he was named procureur-general to the council of St. Domingo. He had previously been engaged on a translation of Ariosto, which he finished before his return to France five years afterwards, but it perished during the shipwreck which occurred during his voyage home. After the Revolution he was elected deputy to the National Assembly, of which he first became secretary and then president. In 1793 he was imprisoned on account of the political sentiments of his drama *Pamela*, but a few days afterwards the Revolution of the 9th of August restored to him his freedom. In 1798 he became minister of the interior, in which office he distinguished himself by the thoroughness of his administration in all departments. It is to him that France owes its system of inland navigation. From 1804 to 1806 he was president of the senate, and in that capacity the duty devolved upon him of soliciting Napoleon to assume the title of emperor. In 1808 he received the dignity of count. Retiring from public life in 1814, he occupied himself chiefly in the study of agriculture, until his death, 10th January, 1828. François de Neufchâteau had very multifarious accomplishments, and interested himself in a great variety of subjects, but his fame rests chiefly on what he did as a statesman for the encouragement and development of the industries of France. His maturer poetical productions did not fulfil the promise of those of his early years, for though some of his verses have a superficial elegance, his poetry generally lacks force and originality. He had considerable qualifications as a grammarian and critic, as is witnessed by his editions of the *Provinciales* and *Pensées* of Pascal, Paris, 1822 and 1826, and *Gil Blas*, Paris, 1820. His principal poetical works are *Poésies Diverses*, 1765; *Ode sur les Parlements*, 1771; *Nouveaux Contes Moraux*, 1781; *Les Vosges*, 1796; *Fables et Contes*, 1814; and *Les Tropes, ou les Figures de Mots*, 1817. He is also the author of a large number of works on agriculture.

See H. Bonnelier, *Mémoires sur François de Neufchâteau*, Paris, 1829; and J. Lamouroux, *Notice historique et littéraire sur la vie et les écrits de François de Neufchâteau*, Paris, 1843.

FRANCONIA, in German Franken, a name of very different application in different historical periods. It properly signifies the land of the Franks, and is consequently identical in original meaning with the word Francia or France. In the beginning of the 4th century the Frankish territory stretched from the Loire eastward to the basin of the Rhine and the Main; but it was shortly afterwards broken up into two divisions—Austrasia, Francia Orientalis, or the kingdom of the East Franks, and Neustria, Francia Occidentalis, or the kingdom of the West Franks. As time went on both kingdoms extended their boundaries; and when the treaty of Verdun in 845 settled the claims of the grandsons of Charles the Great, there was a kingdom of Western France with Latin tendencies, and a kingdom of Eastern France with Teutonic tendencies, each possessing a central district or duchy of its own name. These districts were separated from each other by the district of Lotharingia or Lorraine. The western was soon after lost sight of; but the eastern continued for a long period to be considered the very core and kernel of the German kingdom, and a theory became prevalent that it was the original seat of the Franks in Germany. Under the Saxon and Franconian emperors it was subdivided into Ost-Franken, Francia Orientalis, or Eastern Franconia *par excellence*, and Rhein-Franken, Francia Rhenensis, or Rhenish Franconia. The former, which was also distinguished as Saal-Franken, stretched from the Fichtelgebirge and the Rhone to the Danube, and from the Upper Palatinate to the Spessart and the lands of the Neckar; while the latter was the country between the Spessart and the Rhine, and included the present district of Frankfort-on-the-Main. Though the name frequently occurs in our histories, there was probably no proper "duchy" of Franconia, in the same sense at least as there was a duchy of Saxony or a duchy of Bavaria. Conrad I. and Conrad II., for example, do not style themselves dukes "of" Franconia but dukes "in" Franconia. Both Eastern Franconia and Rhenish Franconia were broken up into a number of distinct territories—countships, lordships, etc. When Maximilian divided Germany into circles in 1501, he gave the name of Franconia to the circle which included the bishoprics of Würzburg, Bamberg, and Eichstädt, the district of Mergentheim belonging to the grand master of the Teutonic Order, the territory of the abbey of Schönthal, the principalities of Baireuth and Ausbach, the countships of Henneberg and Schwarzenberg, the territories of the curia of Franconian counts, the imperial towns of Nuremberg, Rothenburg, Schweinfurt, Weissenburg, and Windsheim. Altogether the circle comprised 69 territories and had an area of about 10,430 square miles, and in 1792 its population amounted to 1,547,000. The name of Franconia ceased to be officially used after the dissolution of the German empire in 1806; but in 1837 King Louis I. of Bavaria gave the names of Upper, Middle, and Lower Franconia to what had previously been known as the circles of the Upper Main, the Rezat, and the Lower Main. Upper Franconia forms the north-east portion of Bavaria, and is partly conterminous with the frontiers of Bohemia, Saxony, and Prussia. Its mountains are the Fichtelgebirge, the Frankenwald, the Böhmerwald, and the Steigerwald; and the Main, the Naab, the Saale, and

the Eger take their rise within its territory. The seat of the administration is at Baireuth, and the court of appeal at Bamberg. Lower Franconia lies to the west, and forms the north-west province of the kingdom,—conterminous with Prussia, Weimar, Meiningen, Würtemberg, Baden, and Hesse. Its rivers are the Main, the Saale, the Itz, and the Baunach. The principal town is Würzburg. Middle Franconia lies to the south of the other two, conterminous with the Upper Palatinate, Swabia, and Würtemberg. It is watered by the Regnitz and the Altmühl. The principal town is Nuremberg, the seat of the administration is at Ausbach, and the court of appeal at Eichstädt.

FRANEKER, a town of Holland, province of Friesland, is situated 10 miles W. of Leeuwarden, on the canal between that town and Haarlingen. The university founded here in 1585 was abolished by Napoleon I., and its endowments were diverted in 1815 to the support of an athenæum, and later of a gymnasium, with which a physiological cabinet and a botanical garden are connected. Franeker also possesses a very fine observatory. The university buildings are occupied by an asylum for insane. The chief industries of the town are silk-weaving, woollen spinning, and shipbuilding. Population in 1900, 7,200.

FRANKENBERG, an important manufacturing town of Saxony, circle of Zwickau, is situated on the Zschopau, 7 miles N.E. of Chemnitz. The principal buildings are the great church, restored in 1874–5, and the new town-house. Frankenberg has extensive woollen, cotton, and silk manufactures, and also dyeworks and cigar factories. Its educational establishments include a city school, a real school, and a technical school for engineering, in connection with which there is a chemical laboratory. Population in 1905, 12,726.

FRANKENHAUSEN, a town of Germany, principality of Schwartzburg-Rudolstadt, is situated on the Little Wipper, 36 miles N.N.E. of Gotha. It consists of an old and a new town, the latter mostly rebuilt since a very destructive fire in 1833, and has an old castle, two churches, a seminary for teachers, a hospital, and a new town-house. Its industries include the manufacture of sugar, cigars, and buttons, and there is a salt mine in the vicinity. At Frankenhausen a battle was fought 15th May, 1525, in which the peasants under Thomas Münzer were defeated by the Saxon, Brunswick, and Hessian troops. Population in 1905, 6,374.

FRANKENSTEIN, a town in the Prussian province of Silesia, government of Breslau, is situated 35 miles S. by W. of the town of that name. It has a monastery of the charity friars, a garrison, and an old castle. The principal manufactures are linen, woollen, and cotton goods, straw hats, chemical substances, and salt. Population in 1905, 7,890.

FRANKENTHAL, a town in the Rhenish district of Bavaria, is situated on the Isenach, 9 miles N.W. of Mannheim, and is connected with the Rhine by a canal 4 miles in length. It has a poorhouse, an infirmary, a deaf and dumb institution, an asylum for insane, and the ruins of an old monastery. Its principal industries are the manufacture of machinery, bell-founding, and brewing.

Frankenthal existed as a village in the 8th century, but it owes its prosperity to a colony of Flemish Protestant refugees who settled there in 1562. After this it rose very rapidly, so that in 1577 it became a town. The Spaniards made an unsuccessful attempt to capture it in 1621, and it was taken by them in 1623. In 1689 it was burned to the ground by the French, and it delivered itself up to the same power in 1796. Population in 1905, 16,899.

FRANKFORT, a city of the United States, capital of Franklin county and of the State of Kentucky, is picturesquely situated on both sides of the Kentucky river, on a space of elevated ground bounded by a bluff 150 feet high. It is distant 29 miles W.N.W. from Lexington, and 65 miles E. from Louisville, by rail. The river is crossed at Frankfort by two bridges, and that portion of the town lying on the south side of the river is known as South Frankfort. The principal buildings are the State house, a marble building with a handsome portico supported by Ionic columns, the institution for imbecile children the State penitentiary, the county court-house, and the public hall. The beautiful cemetery contains the remains of Daniel Boone, the pioneer of Kentucky, who died September 20, 1820. Frankfort has distilleries and flour and cotton mills, and a considerable trade in lumber. The river is navigable for steamers 40 miles above the city. Frankfort was laid out in 1787, and became the capital of the State in 1792. In 1862 it was occupied for a short time by the Confederates. The population in 1860 was 3702, and in 1900, 9,487, of whom 2335 were colored.

FRANKFORT-ON-THE-MAIN, in German FRANKFURT or FRANKFURTH-AM-MAIN, one of the principal cities of the German empire, in the circle of Wiesbaden, in the Prussian province of Hesse-Nassau, and till 1866 one of the four free cities of Germany. It lies about 330 feet above the

level of the sea, in 50° 6′ 43″ N. lat. and 8° 41′ 9″ E. long., 22 miles E. of Mainz and 16 miles N. of Darmstadt. The position which it occupies is one of no small natural beauty in the broad and fertile valley of the Main, its northern horizon being formed by the soft outlines of the Taunus range. The surrounding country is richly clad with orchard and forest, and in the season of spring especially presents a prospect of indescribable luxuriance. In earlier times the city with its fortifications had the form of an irregular pentagon, of which the longest side was defined by the right bank of the river; but now that the fortifications have been demolished, new suburbs have spread out widely in all directions, and the village of Sachsenhausen on the opposite side of the stream has extended in a similar fashion, so that the whole area of architectural occupation measures about 2½ miles from E. to W., and about 2 miles from N. to S. Even within the old enceinture great transformations have been effected, and much of the quaint domestic architecture and the intricate network of narrow streets and lanes has given way to modern improvements. Only one side, for example, of the famous Judengasse or Jews' Street is now standing, the other having been demolished since 1870; but the visitor can still see the house were Ludwig Börne was born in 1786, and the dingy and unpretentious premises of No. 148 which saw the rise of the Rothschild family. When the whole of what remains of this street has been pulled down and rebuilt, as it must be ere long, there

will still be many less celebrated parts of the old city of no small interest as eloquent relics of bygone conditions of life. In the modern quarters Frankfort will compare favorably, both in the general appearance of the streets and in the architectural character of individual buildings, with all except a very few of the greater cities of the Continent; and almost every year this is becoming more certainly true. Among the more spacious streets are the Schöne Aussicht or Beautiful Prospect along the Main, the Kaiser-Strasse or Emperor Street, and the Zeil. The business of the city is largely concentrated in the Zeil, the Rossmarkt or Horse Market, the Kaiser-Strasse, Friedens-Strasse, and their immediate vicinity.

The principal ecclesiastical building in Frankfort is the cathedral of St. Bartholomew's, which is situated not far from the river between the Domplatz on the N. and the Weekmarkt on the S. The date of its first foundation is not precisely known. A church called Salvator's was erected on the site by Louis the German at least as early as 874 A.D., and he enriched it with considerable donations, and instituted a chapter of twelve priests and an abbot. Charles the Fat not only confirmed his father's gifts in 882, but he added a *nona* or ninth of the produce of Frankfort, Trebur, Ingelheim, Kreiznach, and other royal domains. In the 12th century the church obtained possession of the skull of St. Bartholomew, and by the early part of the 13th it appears to have been known as St. Bartholomew's church. The building was by that time in a very dilapidated condition; and consequently Pope Gregory IX. urged the faithful of the diocese of Mainz to contribute to its restoration. When in 1315 the church was appropriated to the religious ceremonies connected with the coronation of the emperors, it was found necessary to enlarge its dimensions. The eastern portion, consisting of the choir and two towers, was pulled down and rebuilt on a larger scale about 1338, and in the same century the wings of the transepts and the imperial election chapel were added. The so-called *Pfarrthurm* or Parson's Tower was built between 1414 and 1512. In 1855 the interior was renovated; but on the night of the 14th August, 1867, the whole building was laid in ruins by a conflagration. In 1869 F. J. Denziger, chief architect of the Ratisbon (or Regensburg) cathedral was entrusted with the work of restoration, and his task has been steadily prosecuted. The only portions of the enterprise uncompleted in 1878 were the cloister and the grand organ. In the interior are still to be seen the high altar at which after 1562 the imperial coronations were celebrated, the tombstone of the emperor Günther of Schwarzburg, who died in Frankfort in 1349, and the tombstone of Rudolph, the last knight of Sachsenhausen, who died in 1371. The other Catholic churches are Leonhardskirche and Liebfrauenkirche, and the Deutschhauskirche in Sachsenhausen. St. Leonhard's ranks second to the cathedral in point of antiquity, and is said to occupy the site of the palace of Charles the Great. It possesses a stained glass window above the high altar, with a Lord's Supper by Hans Holbein. Our Lady's Church was founded in 1322 by Schöffen Weigel of Wambach, was made collegiate in 1326, and underwent a restoration in the second half of the 18th century. St. Paul's (Paulskirche), the principal church of the Evangelical Lutherans, was built between 1786 and 1833 on the site of the old church of the Minorites, and is mainly interesting as the seat of the national parliament of 1848–49. The church of St. Nicholas (Nicolaikirche) dates from the 13th century, and has a fine cast-iron spire erected in 1843. From 1570 to 1721, and again from 1813 to 1841, it was used as a warehouse. St. Catherine's was built about 1678–1680 on the site of an older building famous in Frankfort history as the place where the first Protestant sermon was preached in 1522. The principal synagogue—there are three altogether—is a Mauro-Byzantine structure erected between 1855 and 1860 in room of an older synagogue of the 15th century. Of the secular buildings in Frankfort perhaps the most characteristic is the Rathhaus or Römer, which by a strange coincidence bears a name suggestive of, though not derived from, its principal historical associations. It was here, in the Wahlzimmer or election room, that the electors or their plenipotentiaries decided the choice of the emperors, and here, in the Kaisersaal or emperor's hall, the coronation festival was held, at which the new recipient of the crown dined with the electors after having shown himself from the balcony to the people assembled in the Römerberg, as the open place in front of the building is called. The building dates from the 15th century, and occupies the site of the Golden Swan and two private houses which from time immemorial had borne the name of the Römer. The Kaisersaal retained its antique appearance till 1843; but it is now ornamented with a series of modern paintings by Veit, Jung, Ballenberger, and a score of other German artists representing the "German" emperors from Charlemagne to Francis II., in all fifty-two. The palace of the prince of Thurn and Taxis is a large building in the old French style of considerable historical interest: from 1806 to 1810 it was the residence of the "prince-primate," or head of the confederation of the Rhine; after the battle of Leipsic it was occupied by Francis I. of Austria; and from 1816 to 1866 the parliament of the German confederation held its sessions within its walls. The Eschenheim Tower is a picturesque relic of the ancient fortifications dating from the middle of the 14th century.

Hardly any fact about Frankfort is more familiar to the reader of Goethe than that it has an old bridge over the Main, and that on the bridge there has been for centuries an iron crucifix surmounted by a somewhat insignificant figure of a cock, commemorating, according to tradition, the unfortunate fowl which first crossed the bridge, and thus fell a prey to the devil who, in hope of a nobler victim, had sold his assistance to the original architect. The first distinct mention of a bridge over the river occurs in 1222, and the present structure dates from the 14th century. As late, at least, as 1475 the central span was not arched over. There are now fourteen arches in all, the total length of the bridge being 869 feet. The cock and crucifix are mentioned as early as 1405, and antiquaries assert that it probably marks the spot where criminals in the olden time were flung into the river. About half a mile below the old bridge a new bridge, called the "Unter-Main Brücke," was constructed by P. Schmick, between 1872 and 1874; and about midway between the two lies the footbridge or "Steg," erected by the same engineer in 1868–69, and the first example of its kind in Germany. The "Ober-Main" or Upper-Main Bridge was opened to traffic in the spring of 1878. Several other bridges for railway purposes are projected.

Few cities of the same size as Frankfort are so richly furnished with literary, scientific, and artistic institutions, or possess so many handsome buildings appropriated to their service. The town theatre was built between 1780 and 1827 in a Dutch-French style, and was restored in 1855; and as it has proved too small for the wants of the people, a new opera house has been erected near the Bockenheim gate, after the plans of Professor Lucä of Berlin. There is a public picture gallery in the Saalhof, containing works by Hans Holbein, Grünewald, Vandyck, Teniers, Van der Neer, Hans von Culmbach, Lucas Cranach, Martin Schön, etc. The nucleus of the collection is of very ancient date; considerable additions were made in 1803 at the secularization of the monasteries; in 1839 Ernst Fr. K. Prehn's cabinet of more than 850 small oil-paintings was presented by his heirs, and 220 that had belonged to Johann G. Chr. Daems were added in 1856, in terms of his bequest. The Städel Art Institute (Städel'sche Kunst-Institut) takes its name from Johann Friedrich Städel, who not only left his collection of paintings, engravings, and other property to the town, but appropriated a million marks to the erection of an institute and college. Its picture gallery and cabinet of engravings are both extremely rich in works of German art: the latter in 1874 had 54,300 plates. In the town library, which is kept in a building erected between 1820 and 1825, there are upwards of 100,000 volumes; and among its rarer treasures are a Gutenberg Bible, printed at Mainz between 1450 and 1455, another on parchment dated 1462, the *Institutiones Justiniani*, Mainz, 1468, the *Theuer-Dank*, with woodcuts by Hans Scheufelein, Abyssinian manuscripts presented by the African traveller Rüppel, and autographs of Luther, Melanchthon, Wallenstein, Napoleon I., Goethe, Schiller, etc. The Bethmann Museum owes its celebrity principally to Dannecker's Ariadne, but it also possesses the original plaster model of Thorwaldsen's Entrance of Alexander the Great into Babylon. Among the scientific institutions perhaps the chief place belongs to those named after J. Chr. Senckenberg, the physician. Senckenberg himself founded both the Bürger or citizens' hospital and the medical institute, with an anatomical theatre, botanical garden, and library; and a society of natural science (*Senckenbergsche*

Naturforschende Gesellschaft) was instituted in his honor in 1817, and now possesses an extensive and valuable museum. Large gardens were opened for the patients of the citizens' hospital in 1851, and in 1875 new buildings were added. A physical association was founded in 1824, an association for geography and statistics in 1836, a medical association in 1845, the association for history and archæology in 1857, and the free German institute for science, art, and general culture in 1859. An association for the cultivation of classical and especially of church music (the Cäcilien-Verein) was instituted by Schelble in 1818, and a similar association (the Rühl'sche Verein) by Rühl in 1851; and there are several other musical unions, such as the Philharmonische Verein, the Liederkranz, etc. In 1858 a zoological garden was opened by a joint-stock company near the Bockenheim Road; and in 1873 it was transferred to a new site on the Pfingstweide or Pentecost Meadow, and assigned to a new company. When in 1868 the duke of Nassau offered the plants of his winter garden for sale, a company, the Palm Garden Company, was formed at Frankfort, which purchased the collection, and established what is now the most beautiful of all the pleasure-grounds in the city.

Besides the Bürger Hospital already mentioned, Frankfort has several large institutions for the sick and infirm. The Holy Ghost Hospital, originally founded in 1278 for invalid pilgrims, is now appropriated to the servants and apprentices of Frankfort citizens. Its convalescent hospital, opened in 1868 at the Mainkur, was the first establishment of the kind in Germany. It maintains in each of the fourteen quarters of the town a physician, a surgeon, and an apothecary for the gratuitous assistance of the poor. The new asylum for the insane, with room for 200 patients, was erected between 1859 and 1863, partly by public subscription, and partly by a donation of 100,000 florins from Herr von Wiesenhütten. For its deaf and dumb institution the town is indebted to Ludwig Kosel, who in 1827 started with three pupils; and it was at his suggestion that the blind asylum was established by the society for the furtherance of the useful arts. The Waisenhaus or orphan asylum, erected in 1829, is no longer employed for its original purpose, as it has, since 1860, been thought better to board the orphan children with families in the neighboring villages of Lich, Wächtersbach, etc. It is sufficient to mention the Jewish infirmary, built at the expense of the Rothschilds; the new Jewish hospital, erected in 1874; Dr. Christ's children's hospital, originated in 1835; and the maternity hospital, opened in 1855. Among the numerous associations for benevolent purposes are the *Frauen-Verein*, or ladies' union, founded in 1813 for the assistance of sick families and women in childbed; the Jewish ladies' union for the education of orphan girls; the association originated in 1851 for taking charge of infants during the working hours; the Pestalozzi union (1846) for the education of neglected children, and its auxiliary, the Schuboth institute for Protestant boys (1865); the prison association, dating from 1868; and the Martha asylum, dating from 1866.

Frankfort has always been much more of a commercial han an industrial town, and at present it manufactures little else but Frankfort black, waxcloth, jewelry, gold and silver thread, tapestry, and such like articles. Bockenheim, however, a small town with which it is connected by tramway lines, is a flourishing manufacturing centre; and the Frankfort capitalists are connected with the industrial enterprises of Wiesbaden, Hanau, Offenbach, etc. There are two great fairs held in the town—the Ostermesse or spring fair, and the Herbstmesse or autumn fair. The former, which was the original nucleus of all the commercial prosperity of the city, begins on the second Wednesday before Easter; and the latter on the second Wednesday before the 8th of September. They last three weeks, and the last day save one, called the *Nickelchestag*, is distinguished by the influx of people from the neighboring country. The trade in leather is of great and growing importance. A horse fair has been held twice a year since 1862 under the patronage of the agricultural society; and the wool market was reinstituted in 1872 by the German Trade Society. Frankfort has long been famous as one of the principal banking centres of Europe; and throughout the city there are upwards of 220 banking offices. The so-called "Frankfort Bank" was founded in 1854, with a capital of 10,000,000 gulden. The exchange occupies a building opposite the Paulskirche, erected since 1840 according to the plans of Stüler of Berlin; and it is remarkable for the large business that is done in Government stock. In the 17th century the town was the seat of a great book-trade; but it has long been distanced in this department by Leipsic. The *Frankfurter Journal* was founded in 1615, the *Postzeitung* in 1616, the *Neue Frankfurter Zeitung* in 1859, and the *Frankfurter Presse* in 1866. The zoological garden company publish a monthly magazine devoted to the popularization of natural history; and the Senckenberg society have issued *Transactions* since 1854–55.

There are four railway stations in Frankfort: by the Weser station the traveller leaves for Nauheim and Cassel, for Homburg, for Kronberg, and the north generally; from the Taunus station he proceeds along the right bank of the river to Mainz; from the Neckar station he leaves for Darmstadt and the south, and for Mainz by the line along the left bank of the river; and from the Hanau station he proceeds eastwards. In Sachsenhausen there is the Offenbach-Hanau station. The Neckar railway crosses the river by a bridge erected in 1846–48, which is also used by the Offenbach and the "Linksmainisch" lines. Several other bridges across the river are projected in connection with the scheme for centralizing the railway systems. Communication within the town is facilitated by tramways; and there is also a line all the way to Bockenheim.

Frankfort has been the birthplace of not a few of the most celebrated men of Germany. J. G. Schlosser the historian, Feuerbach the philosopher, Kirchner the scholar and naturalist, Clement Brentano, Bettina von Arnim, and Ludwig Börne, are all in the list; but what the city considers its highest literary distinction is the fact that Johann Wolfgang Goethe was born in 1749 at No. 23 Hirschgraben. In 1863 the house was purchased for 56,000 florins by the Free German "Hochstift" (or Grand Association) for the sciences, arts, and general culture, and thus made for ever the common property of the German people. The society consists of members in all parts of the world, associated by admiration of the poet. Under the direction of Otto Volga the house has been as much as possible put into the state in which it was in Goethe's youth; and at the same time the rooms are turned into so many little museums of Goethe literature and art. On the high grounds to the south of the river there is a spot, now known as the Gothe Ruhe, or Goethe's Rest, where the poet is said to have admired the prospect of his native town, and there a tasteful wooden tower in the Swiss châlet style was built in 1877 by the Verschönerungs-Verein, or association for the beautifying of the city. The Goethe statue was erected in 1844 in what is now the Goethe Platz to the north of the Rossmarkt; it was designed by Schwanthaler, and cast in the royal foundry at Munich.

Of memorial monuments the largest and most elaborate in Frankfort is that erected in 1858 in honor of the early German printers. It was modelled by Ed. von der Lausitz and executed by Herr von Kreis. The statues of Gutenberg, Fust, and Schöffer form a group on the top; an ornamented frieze presents medallions of a number of famous printers; below these are figures representing the towns of Mainz, Strasburg, Venice, and Frankfort; and on the corners of the pedestal are allegorical statues of theology, poetry, science, and industry. The Schiller statue, erected in 1863, is the work of a Frankfort artist, Dielmann. A monument in the Bockenheim Anlege, dated 1837, preserves the memory of Guiollet, the burgomaster, to whom the town is mainly indebted for the beautiful promenades which occupy the site of the old fortification; and similar monuments have been reared to Senckenberg (1863), Bethmann, and Wiesenhütten. A statue of Charlemagne adorns the old Main bridge.

The new cemetery (opened in 1828) contains the graves of Arthur Schopenhauer and Feuerbach, of Passavant the biographer of Raphael, Ballenberger the artist, Hessemer the architect, Sömmerring the naturalist, Dr. Böhmer, and Städel. The Bethmann vault attracts attention by three bas-reliefs from the chisel of Thorwaldsen; and the Reichenbach mausoleum is a vast pile designed by Hessemer at the command of William II. of Hesse, and adorned with sculptures by Zwerger and Von der Lausitz. In the Jewish section, which is walled off from the rest of the burying-ground, the most remarkable tombs are those of the Rothschild family.

The present municipal constitution of the town dates from

1867 and conforms to the Prussian system. The electors choose 54 representatives for a term of 6 years; and every two years a third of the number retire, but are eligible for re-election. The 54 representatives elect twelve town councillors, six of whom receive a salary and serve for 12 years, while the rest receive no salary and serve for 6 years. The chief burgomaster is nominated by the king for 12 years, and the second burgomaster must receive the king's recognition. Since 1873 the town has been supplied with water from the Vogelsberg and the Spessart by the Frankfurter Quellwasserleitung Gesellschaft at the rate of about a million cubic feet per day, the natural pressure being sufficient to carry the water to the highest stories. The population of Frankfort has continued almost steadily to increase since the beginning of the century, the yearly percentage varying from 0·1 in 1843 to 8·9 in 1872. In 1817 the civil population was 41,458; in 1840, 55,269; in 1849, 58,599; in 1855, 63,495; and in 1864, 77,372. The events of 1866 led to a decline, and in 1867 the number was only 75,918. By 1871 it had again risen to 89,265; in 1872 it was 97,230; in 1873, 102,680; and in 1890, 179,985. Including the suburban villages (Bornheim 10,085, Bockenheim 13,043, Oberrad 4609, and Rödelheim 3903), in 1905, 288,989.

History.—Though the Romans certainly had settlements in the valley of the Main, as at Mattiacum (Wiesbaden) and Novus Vicus (Heddernheim), there is no proof that the site of Frankfort was permanently occupied before the arrival of the Franks, from whom it derives its name. Father Fuchs of Mainz, indeed, asserted in the end of the 18th century, that he had epigraphic evidence for the statement that Frankfort was founded by the Romans in the 2d century of the Christian era, and that by the 3d century it had become a great fortified city; but unfortunately none of the inscriptions to which he referred have ever been shown to exist. Popular tradition connects the origin of the town with the history of Charlemagne, asserting that the name Frankfort is due to the fact that once, when he was retreating from the Saxons, he and his Frankish army were safely conducted across the river by a doe, and that Sachsenhausen was so called because he settled there a colony of the Saxons whom he had subdued. The first truly historical notice of the town occurs in 793, when Eginhard, Charlemagne's biographer, tells us that he spent the winter in the villa Frankonovurd. Next year there is mention more than once of a royal palace there, and the early importance of the place is indicated by the fact that it was chosen as the seat of an ecclesiastical council, which was attended not only by German but by French and Italian bishops, as well as by two papal legates. The name Frankfort is also found in several official documents of Charlemagne's reign; and from the notices that occur in the early chronicles and charters it would appear that the place was the most populous at least of the numerous villages of the Main district. During the Carlovingian period it was the seat of no fewer than 16 imperial councils or colloquies. The town was probably at first built on an island in the river. It was originally governed by a royal officer or *actor dominicus*, and down even to the close of the empire it remained a purely imperial or royal town. It gradually acquired various privileges, and by the close of the 14th century the only mark of dependence was the payment of a yearly tax. Louis the Pious dwelt even more frequently at Frankfort than his father had done, and about 823 he built himself a new palace, the basis of the later Saalhof. In 822 and 823 two great diets were held in the palace, and at the former there were present deputies from the eastern Slavs, the Avars, and the Normans. The place continued to be a favorite residence with Louis the German, and he died there in 876. By the rest of the Carlovingian kings it was less frequently visited, and this neglect was naturally greater during the period of the Saxon and Salic emperors from 908 to 1137. Diets, however, were held in the town in 951, 1015, 1069, and 1109, and councils in 1000 and 1006. From a privilege of Henry IV., in 1074, granting the city of Worms freedom from tax in their trade with several royal cities, it appears that Frankfort was even then a place of some commercial importance. In 1217 we find mention made of an imperial mint and a corn market in the town. About 1227 it was already in possession of a yearly fair. Between 1140 and the beginning of the interregnum it saw 21 diets, and that of 1142 gave rise to the Guelph and Ghibelline parties. No fewer than 10 new churches were erected in the 50 years from 1220 to 1270. It was about the same period, probably in 1240, that the Jews first settled in the town. In the contest which Louis the Bavarian maintained with the papal throne Frankfort sided with the emperor, and it was consequently placed under an interdict for 20 years from 1329 to 1349. On Louis's death it refused to accept the papal conditions of pardon, and only yielded to Charles IV., the papal elect, when Günther of Schwarzburg thought it more prudent to abdicate in his favor. Charles granted the city a full amnesty, and confirmed its liberties and privileges. By the famous bull of 1356, called by way of distinction the Golden Bull, or, after the emperor, *Bulla Carolina*, Frankfort is declared the seat of the imperial elections (Wahlstadt Reiches), and it still preserves an official contemporaneous copy of the original document as the most precious of the eight imperial bulls in its possession. In the 17th and 18th centuries, says Kriegk, the bull was regarded as the most notable sight of the city, and was only exhibited to persons of high rank. From the date of the bull to the close of the empire, Frankfort retained the position of "Wahlstadt," and only five of the two-and-twenty monarchs who ruled during that period were elected elsewhere. In 1388–89 Frankfort assisted the South-German towns in their wars with the princes and nobles, and in a consequent battle with the troops of the Palatinate, the town banner was lost and carried to Kronberg, where it was long preserved as a trophy. On peace being concluded in 1391, the town had to pay 12,562 florins, and this brought it into great financial difficulties. In the course of the next 50 years debt was contracted to the amount of 126,772 florins. The diet at Worms in 1495 chose Frankfort as the seat of the newly instituted Imperial Chamber, or "*Reichs-Kammergericht*," for the settlement of discussions between the different states of the empire; and it was not till 1527 that the chamber was removed to Spires. At the Reformation Frankfort heartily joined the Protestant party, and in consequence it was hardly treated both by the emperor Charles V. and by the archbishop of Mainz. It refused to subscribe the Augsburg Recess, but at the same time it was not till 1536 that it was prevailed to join the Smalkaldic League. On the failure of this confederation it opened its gates of its own accord to the imperial general Büren on 29th Dec., 1546, although he had passed by the city, which he considered too strong for the forces under his command. The emperor was merciful enough to leave it in possession of its privileges, but he inflicted a fine of 80,000 gold gulden, and the citizens had to endure till Oct., 1547, the presence of from 8000 to 10,000 soldiers. This resulted in a pestilence which not only lessened the population but threatened to give the death-blow to the great annual fairs; and at the close of the war it was found that it had cost the city no less than 228,931 gulden. In 1522 Frankfort was invested for three weeks by Maurice of Saxony, who was still in arms against the emperor, but it continued to hold out till peace was concluded between the principal combatants. Between 1612 and 1616 occurred the great Fettmilch insurrection, perhaps the most remarkable episode in the internal history of Frankfort. The magistracy had been acquiring more and more the character of an oligarchy; all power was practically in the hands of a few closely-related families; and the gravest peculation and malversation took place without hindrance. The ordinary citizens were roused to assert their rights, and they found leaders in Fettmilch, Gerngross, and Schopp, who carried the contest to dangerous excesses, but lacked ability to bring it to a successful issue. An imperial commission was ultimately appointed, and the three principal culprits and several of their associates were executed in 1616, with the barbarous devices of the times. It was not until 1801 that the last mouldering head of the Fettmilch company dropped unnoticed from that old tower which, from its position near the bridge, is known as the Brückenthurm. In the words of Dr. Kriegk, who has furnished a detailed history of the whole period, the insurrection completely destroyed the political power of the guilds, gave new strength to the supremacy of the patriciate, and brought no further advantage to the rest of the citizens than a few improvements in the organization and administration of the magistracy. The Jews, who had been attacked by the popular party, were solemnly reinstated by imperial command in all their previous privileges, and received full compensation for their losses. During the Thirty Years' War Frankfort did not escape. In 1631 Gustavus Adolphus garrisoned it with 600 men, who remained in possession till they were expelled four years later by the imperial general Lamboy. In 1792 the citizens had to pay 2,000,000 gulden to the French general Custine; and in 1796 Kléber bombarded the town, and exacted 8,000,000 francs. The independence of Frankfort was brought to an end in 1806, on the formation of the Confederation of the Rhine; and in 1810 it was made the capital of a grand-duchy of Frankfort, which had an area of 3215 square miles, with 302,100 inhabitants, and was divided into the four districts of Frankfort, Aschaffenburg, Fulda, and Hanau. On the reconstitution of Germany in 1815 it again became a free city, and in the following year it was declared the seat of the German Confederation. In April, 1833, occurred what is known as the Frankfort Riot (Frankfurter Attentat), in which a number of German students, assisted by the peasants of the vicinity, attempted to break up the diet. The city joined the German Zollverein in 1836. During the revolutionary period of 1848 the people of Frankfort took a chief part in political movements, and the streets of the town were more than once the scene of conflict. In the war of 1866 they were on the Austrian side. On the 16th of July the Prussian troops, under General Vogel von Falkenstein, entered the town, and on the 8th of October it was formally incorporated with the Prussian state. A fine of 6,000,000 florins

was exacted. In 1871 the treaty which concluded the Franco-German war was signed in the Swan Hotel by Prince Bismarck and Jules Favre, and it is consequently known as the Frankfort Peace.

M. und Umgebungen* (no date). In 1864 Fr. W. Delkeskamp published a beautiful *Malerischer Plan von Frankfurt a. M. und seiner nächsten Umgebung; nach der Natur aufgenommen und auf geometrischer Basis in Vogelschau gezeichnet.* (H. A. W.)

FRANKFORT-ON-THE-ODER, in German *Frankfurt-an-der-Oder*, a town of Germany at the head of a government in the Prussian province of Brandenburg, about 50 miles in an easterly direction from Berlin. The town proper, which has far outgrown the limits of its ancient walls, lies on the left of the river, but it is connected by a wooden bridge 900 feet long with the suburb of Damm. Among the more important buildings are the Protestant church of St. Mary's (the Oberkirche), a handsome brick edifice of the 13th century, the Roman Catholic church, the Jewish synagogue, the Rathhaus, dating from 1607, and bearing on its southern gable the sign of the Hanseatic League, the city infirmary, three hospitals, an orphan asylum, a workhouse, a theatre, the Frederick gymnasium, and the provincial industrial school. The university of Frankfort, which was founded in 1506 by the elector of Brandenburg, Joachim I., was removed to Breslau in 1811, and the university buildings are now occupied by the Realschule. As the chief town of a province, Frankfort is the seat of a court of appeal, a general commission, and a number of administrative boards. Its industry is mainly devoted to the manufacture of iron-wares, pottery, paper, silk and woollen goods, bone-dust, chocolate, and liqueurs. Being situated on the high road from Berlin to Silesia, commanding an extensive system of water communication by means of the Oder and its canals to the Vistula and the Elbe, and in modern times having become an important railway junction, it maintains no small commercial activity, which is further fostered and concentrated by its three annual fairs held respectively at *Reminiscere* or the second Sunday in Lent, at St. Margaret's day, and at Martinmas. The population, which in 1849 was 29,969, had at the census of 1905 attained to 61,852. The municipal existence of Frankfort goes back to 1253, when it was colonized by Frankish merchants introduced by John and Conrad of Brandenburg, who had recently conquered the district from the Wends. The principal facts in its external history are —the siege which it successfully sustained against the emperor Charles IV. in the time of the pretender Waldemar; the papal excommunication in 1426, on account of its quarrel with the bishop of Lebus; the siege of the Hussites in 1432, of the Poles in 1450, and of the duke of Sagan in 1477; and its capture by Gustavus Adolphus in 1631, and by the Russians in 1759. The presence of the Russians on this occasion cost the town 300,000 thalers, and in the earlier part of the following century the continual quartering of foreign troops created great destitution, compelling the magistrates to procure a loan of 208,000 thalers. Ewald von Kleist died in the town in August, 1759, from the effects of a wound received in the battle at the neighboring village of Kunersdorf; a monument was erected over his grave in the "park" in 1779. Henrich von Kleist was born in the town in 1776, and Franz von Gaudy in 1800.

FRANKINCENSE,[1] or OLIBANUM[2] (Gr., λιβανωτός, later θύος; Lat., *tus* or *thus*; Heb., *lebonah*;[3] Ar., *lubân*;[4] Turk., *ghyunluk*; Hind,, *ganda-birosa*[5]), a gum-resin obtained from certain species of trees of the genus *Boswellia*, and natural order *Burseraceæ*. The members of the genus are possessed of the following characters:—Bark often papyraceous; leaves deciduous, compound, alternate, and imparipinnate, with leaflets serrate or entire; flowers in racemes or panicles, white, green, yellowish, or pink, having a small persistent, 5-dentate calyx, 5 petals, 10 stamens, a sessile 3 to 5-chambered ovary, a long style, and a 3-lobed stigma; fruit trigonal or pentagonal; and seed compressed. Dr. George Birdwood (*Trans. Lin. Soc.*, xxvii., 1871) distinguishes five species of Boswellia:—(A) *B. thurifera*, Colebr. (*B. glabra* and *B. serrata*, Roxb.), indigenous to the mountainous tracts of Central India and the Coromandel coast, and *B. papyrifera* (*Plösslea floribunda*, Endl.) of Abyssinia, which, though both thuriferous, are not known to yield any of the olibanum of commerce; and (B) *B. Frereana* (see ELEMI, vol. viii. p. 116), *B. Bhau-Dajiana*, and *B. Carterii*, the "Yegaar," "Mohr Add," and "Mohr Madow" of the Somali country, in East Africa, the last species including a variety, the "Maghrayt d'Sheehaz" of Hadramaut, Arabia, all of which are sources of true frankincense, or olibanum. The trees on the coast of Adel are described by Captain G. B. Kempthorne as growing, without soil, out of polished marble rocks, to which they are attached by a thick oval mass of substance resembling a mixture of lime and mortar: the purer the marble the finer appears to be the growth of the tree. The young trees, he states, furnish the most valuable gum, the older yielding merely a clear glutinous fluid resembling copal varnish.[6] To obtain the frankincense a deep incision is made in the trunk of the tree, and below it a narrow strip of bark five inches in length is peeled off. When the milk-like juice ("spuma pinguis," Pliny) which exudes has hardened by exposure to the atmosphere, the incision is deepened. In about three months the resin has attained the required degree of consistency. The season for gathering lasts from May until the first rains in September. The large clear globules are scraped off into baskets, and the inferior quality that has run down the tree is collected separately. The coast of South Arabia is yearly visited by parties of Somalis, who pay the Arabs for the privilege of collecting frankincense.[7] In the interior of the country about the plain of Dhofâr,[8] during the south-west monsoon, frankincense and other gums are gathered by the Beni Gurrah Bedouins, and might be obtained by them in much larger quantities; their lawlessness, however, and the lack of a safe place of exchange or sale are obstacles to the development of trade. (See C. Y. Ward, *The Gulf of 'Aden Pilot*, p. 117, 1863.) Much as formerly in the region of Sakhalites in Arabia (the tract between Ras Makalla and Ras Agab),[9] described by Arrian, so now on the sea-coast of the Somali country, the frankincense when collected is stored in heaps at various stations. Thence, packed in sheep and goat-skins, in quantities of 20 to 40 lb, it is carried on camels to Berbera, for shipment either to Aden, Makalla, and other Arabian ports, or directly to Bombay.[10] At Bombay, like gum-acacia, it is assorted, and is then packed for re-exportation to Europe, China, and elsewhere.[11] Arrian relates that it was an import of Barbarike on the Sinthus (Indus). The idea held by several writers, including Niebuhr, that frankincense was a product of India, would seem to have originated in a confusion of that drug with benzoin and other

[1] Stephen Skinner, M.D. (*Etymologicon Linguæ Anglicanæ*, Lond., 1671), gives the derivation: "Frankincense, Thus, *q. d.* Incensum (*i. e.*) Thus Libere seu Liberaliter, ut in sacris officiis par est, adolendum."

[2] "Sic *olibanum* dixere pro thure ex Græco ὁ λίβανος" (Salmaslus, *C. S. Plinianæ Exercitationes*, t. ii. p. 926, b. F., Traj., ad Rhen., 1689, fol.). So also Fuchs (*Op. Didact.*, pars. ii. p. 42, 1604, fol.), "Officiuis non sine risu eruditorum, Græco articulo adjecto, *Olibanus* vocatur." The term *olibano* was used in ecclesiastical Latin as early as the pontificate of Benedict IX., in the 11th century. (See Ferd. Ughellus, *Italia Sacra*, tom. i. 108, D, Ven., 1717, fol.)

[3] So designated from its whiteness (J. G. Stuckius, *Sacror. et Sacrific. Gent. Descrip.*, p. 79, Ludg. Bat., 1695, fol.; Kitto, *Cycl. Bibl. Lit.*, ii. p. 806, 1870): *cf. Laben*, the Somali name for cream (R. F. Burton, *First Footsteps in E. Africa*, p. 178, 1856).

[4] Written *Louan* by Garcias da Horta (*Aromat. et Simpl. Medicament Hist., C. Clusii Atrebatis Exoticorum Lib. Sept.*, p. 157, 1605, fol.), and stated to have been derived by the Arabs from the Greek name, the term less commonly used by them being *Conder: cf.* Sanskrit *Kunda*. According to Colebrooke (in *Asiatick Res.*, ix. p. 379, 1807), the Hindu writers on Materia Medica use for the resin of *Boswellia thurifera* the designation *Cunduru*.

[5] A term applied also to the resinous exudation of *Pinus longifolia* (see Dr. E. J. Waring, *Pharmacopœia of India*, p. 52, Lond., 1868).

[6] See "Appendix," vol. i. p. 419 of Sir W. C. Harris's *Highlands of Æthiopia*, 2d ed., Lond., 1844; and *Trans. Bombay Geog. Soc.*, xiii., 1857, p. 136.

[11] Pereira, *Elem. of Mat. Med.*, ii. pt. 2, p. 380, 4th ed., 1847.

odoriferous substances, and also in the sale of imported frankincense with the native products of India. The gum resin of *Boswellia thurifera* was described by Colebrooke (in *Asiatick Researches*, ix. 381, and after him by Dr. J. Fleming (*Ib.*, xi. 158), as true frankincense, or olibanum; from this, however, it differs in its softness, and tendency to melt into a mass[1] (Birdwood, *loc. cit.*, p. 146). It is sold in the village bazaars of Khandeish in India under the name of *Dup-Salai, i. e.*, incense of the "Salai tree;" and according to Mr. F. Porter Smith, M.B. (*Contrib. towards the Mat. Med. and Nat. Hist. of China*, p. 162, Shanghai, 1871), is used as incense in China. The last authority also mentions olibanum as a reputed natural product of China. Bernhard von Breydenbach,[2] Ausonius, Florus, and others, arguing, it would seem, from its Hebrew and Greek names, concluded that olibanum came from Mount Lebanon; and Chardin (*Voyage en Perse*, etc., 1711) makes the statement that the frankincense-tree grows in the mountains of Persia, particularly Caramania.

That frankincense, or olibanum, was in ancient times, as now, of West-Asiatic origin there is abundant evidence in the writings of classical authors. It was Sabæan incense that was burnt on the altar of Venus at Paphos (Virg., *Æn.*, i. 416; *cf. Georg.*, ii. 117), and Arabia and the land of Thus were synonymous (*cf.* Plautus, *Trinummus*, iv. 2. 89, and *Pœnulus*, v. 4. 6). Herodotus (iii. 107) and Pliny (*loc. cit.*) speak of Arabia as the only country that yields frankincense; Strabo (xvi. 4) and Arrian more correctly mention it as an export also of the neighboring African coast. According to Diodorus Siculus (v. 41), the "Holy Island," at the furthest point of Arabia Felix, the habitation of the Panchæans, was the source of frankincense.

In the Scriptures "incense," or frankincense, is noticed as forming part of the merchandise of the Sabæans (Heb. *Shebaiim*), who inhabited Sheba or Arabia Felix (*cf.* Is. xl. 6, Jer. vi. 20, and 1 Kings x. 10). Theophrastus (*Opera*, ix. 4., ed. F. Wimmer, p. 143) relates that with other spices it was produced by the regions of Arabia about Saba, Adramyta, Citibæna, and Mamali, and after transportation to the Sabæan temple of the Sun was purchased by merchants who came thither.

The libanotophorous region of the ancients is defined by Carter (*J. Bombay Br. R. Asiatic Soc.*, ii. p. 387, 1847) as extending between the Sabhan Mountains, in 17° 30′ N. lat. and 55° 23′ E. long., and the town of Damkote, in the bay of Alkammar, in 52° 47′ E. long. The trees there are congregated in two distinct localities—on the Nejdee or high land, two days' journey from the sea-shore, and on the Sahil or plain on the coast.[3] Its ancient evil reputation as a land of fogs and dark atmosphere, where slaves, as a punishment, collected the frankincense (Vincent's *Voyage of Nearchus*, etc., p. 89, Oxf., 1809), and where the trees that afforded that substance were infested with winged serpents of various colors, which could be driven away only by the smoke of storax (Herod. iii. 107), was not improbably due to the fertile imaginations of Arabian spice-monopolists. By their trade in frankincense and other aromatics the Sabæans and Gerrhæi, we are informed by Strabo, became the richest of all the Arabian tribes; and it was doubtless from their emporium at Petra that these, with other articles of commerce, were by caravan conveyed into Egypt and Canaan by the Edomites, Idumæans, or, as they came to be called, Nabatæans, and into the Mediterranean coast-regions by the Phœnician Arabs. (See Dr. G. Birdwood's *Handbook to the British Indian Section, Paris Universal Exhibition of 1878*, Lond. and Par., 1878, p. 32.) In what is believed to have been the early part of the 15th century B.C. (see EGYPT, vol. vii. p. 639), the ships of the Egyptian queen Hatasu, or Hatshepu, made an expedition to Pun or Punt (held by Professor Dümichen to be the countries on the Arabian coast of the Red Sea where the Phœnicians were established before they settled on the shores of the Mediterranean), and thence brought to Thebes, together with ivory, gold, silver, dog-faced baboons,[4] leopard-skins, and other of the "magnificent products of Pun," not only incense-resin, but 31 incense-trees, planted in tubs, from the "mountains of the barbarians."[5]

From the frequent employment of frankincense in the sacrifices of the ancients, shown by numerous passages in their prose and poetic writings, it is evident that the trade in that substance must formerly have been very extensive. A tribute of no less than a thousand talents' weight of it was brought to Darius every year by the Arabs, and the same quantity was yearly burnt by the Chaldæans on their great altar to Bel at Babylon (Herodotus, iii. 97, i. 183). From the spoils of Gaza, in Syria, 500 talents' weight of frankincense was sent by Alexander the Great to Leonidas (see Plutarch's *Lives*). It was in olden times accounted one of the most valuable of the products of the East. Ten talents' weight of it was one of the precious gifts sent by Seleucus II., king of Syria, and his brother Antiochus Hierax, king of Cilicia, to the temple of Apollo at Miletus, 243 B.C.;[6] and gold, frankincense, and myrrh were presented by the magi from the East to the infant Saviour (Matt. ii. 11).[7] Later, in the time of St. Silvester (314–335 A.D.), we find 100 pounds of "aromatum in incensum," or frankincense, mentioned among the costly offerings made by the emperor Constantine in the basilica of St. Marcellinus and St. Peter at Rome.[8]

Frankincense, or olibanum, occurs in commerce in semi-opaque, round, ovate, or oblong tears or irregular lumps, which are covered externally with a white dust, the result of their friction against one another. It has an amorphous internal structure, a dull fracture; is of a yellow to a yellowish-brown hue, the purer varieties being almost colorless, or possessing a greenish tinge; and has a somewhat bitter aromatic taste, and a balsamic odor, which is developed by heating. Immersed in alcohol it becomes opaque, and with water it yields an emulsion. It contains about 72 per cent. of resin soluble in alcohol (Kurbatow); a large proportion of gum soluble in water, and apparently identical with gum-arabic; and a small quantity of a colorless inflammable essential oil, one of the constituents of which is the body oliben, $C_{10}H_{16}$. Frankincense burns with a bright white flame, leaving an ash consisting mainly of calcium carbonate, the remainder being calcium phosphate, and the sulphate, chloride, and carbonate of potassium (Braconnot).[9] Good frankincense, Pliny tells us, is recognized by its whiteness, size, brittleness, and ready inflammability. That which occurs in globular drops is, he says, termed "male frankincense;" the most esteemed, he further remarks, is in breast-shaped drops, formed each by the union of two tears.[10] The best frankincense, as we learn from Arrian,[11] was formerly exported from the neighborhood of Cape Elephant in Africa (the modern Ras Fiel); and A. von Kremer, in his description of the commerce of the Red Sea (*Ægypten*, etc., p. 185, ii. Theil, Leipzig, 1863) observes that the African frankincense, called by the Arabs "asli," is of twice the value of the Arabian "luban." Captain S. B. Miles (*loc. cit.*, p. 64) states that the best kind of frankincense, known to the Somali as "bedwi" or "sheheri," comes from the trees "Mohr Add" and "Mohr Madow" (*vide supra*), and from a taller species of *Boswellia*, the "Boido," and is sent to Bombay for exportation to Europe; and that an inferior "mayeti," the produce of the "Yegaar," is exported chiefly to Jeddah and Yemen ports.[12]

[1] "*Boswellia thurifera*," . . . says Waring (*Pharm. of India*, p. 52), "has been thought to yield East Indian olibanum, but there is no reliable evidence of its so doing."

[2] "Libanus igitur est mons redolentio & summe aromaticitatis. nam ibi herbe odorifere crescunt. ibi etiam arbores thurifere coalescunt. quarum gummi electum olibanum a medicis nuncupatur."—*Peregrinatio*, p. 53, 1502, fol.

[3] *Cf.* Theophrastus (*op. cit.*, p. 144): τὰ μέν ἐν τῷ ὄρει τὰ δ' ἐν ταῖς ἰδιαις γεωργίαις ὑπὸ τὴν ὑπώρειαν."

[4] *Cf.* King Solomon's imports in the ships of the Phœnician city of Tarsus or Tarshish (2 Chron. ix. 21).

[7] According to an old Persian legend, and other traditions, the gold signified the kingship, the frankincense the divinity, the myrrh the healing powers of the Child. See H. Yule, *The Book of Ser Marco Polo*, vol. i. pp. 73–78, 1871.

[8] Vignolius, *Liber Pontificalis*, t. i. p. 101, Romæ, 1724, 4to.

[9] See, on the chemistry of frankincense, Braconnot, *Ann. de Chimie*, lxviii., 1808, pp. 60–69; Johnston, *Phil. Trans.*, 1839, pp. 301–305; J. Stenhouse, *Ann. der Chem. und Pharm.*, xxxv., 1840, p. 306; and A. Kurbatow, *Zeitsch. für Chem.*, 1871, p. 201.

[10] "Præclpua autem gratia est mammoso, cum hærente lacryma priore consecuta alia miscuit se" (*Nat. Hist.*, xii. 32). One of the Chinese names for frankincense, *Ju'-hiang*, "milk-perfume," is explained by the *Pen Ts'au* (xxxiv. 45), a Chinese work, as being derived from the nipple-like form of its drops. (See E. Bretschneider, *On the Knowledge possessed by the Ancient Chinese of the Arabs*, etc., p. 19, Lond., 1871.)

[11] *The Voyage of Nearchus*, *loc. cit.*

[12] Vaughan (*Pharm. Journ.*, xii., 1853) speaks of the Arabian Lubân, commonly called *Morbat* or *Shaharree Luban*, as realizing higher prices in the market than any of the qualities exported from Africa. The incense of "Esher," *i. e.*, Shihr or Shehr, is mentioned by Marco Polo, as also by Barbosa. (See Yule, *op. cit.*, ii., p. 377.) J. Raymond Wellsted (*Travels to the City of the Caliphs*, p. 173, Lond., 1840) distinguishes two kinds of frankincense—"*Meaty*," selling at $4 per cwt., and an inferior article fetching 20 per cent. less.

The latter may possibly be what Niebuhr alludes to as "Indian frankincense."[1] Garcias da Horta, in asserting the Arabian origin of the drug, remarks that the term "Indian" is often applied by the Arabs to a dark-colored variety.[2]

According to Pliny (*Nat. Hist.* xiv. 1; *cf.* Ovid, *Fast.* i. 337 *sq.*), frankincense was not sacrificially employed in Trojan times. It was used by the ancient Egyptians in their religious rites, but, as Herodotus tells us (ii. 86), not in embalming. It constituted a fourth part of the Jewish incense of the sanctuary (Ex. xxx. 34), and is frequently mentioned in the Pentateuch. With other spices it was stored in a great chamber of the house of God at Jerusalem (1 Chron. ix. 29, Neh. xiii. 5–9). On the sacrificial use and import of frankincense and similar substances see INCENSE.

In the Red Sea regions frankincense is valued not only for its sweet odor when burnt, but as a masticatory; and blazing lumps of it are not infrequently used for illumination instead of oil lamps. Its fumes are an excellent insectifuge. As a medicine it was in former times in high repute. Pliny (*Nat. Hist.*, xxv. 82) mentions it as an antidote to hemlock. Avicenna (ed Plempii, lib. ii. p. 161, Lovanii, 1658, fol.) recommends it for tumors, ulcers of the head and ears, affections of the breast, vomiting, dysentery, and fevers. Dr. Delioux of Toulon (*Bull Gén. de Thérap.*, Feb. 28, 1861,) considers its curative properties equal to those of other balsamic medicines, and that for cheapness it is preferable for hospital use to the balsams of Peru and Tolu, and, being more agreeable to the stomach, to tar. As a fumigating agent, he advocates its employment in bronchitis and chronic laryngitis. In the East frankincense has been found efficacious as an external application in carbuncles, blind boils, and grangrenous sores, and as an internal agent is given in gonorrhœa. In China it was an old internal remedy for leprosy and struma, and is accredited with stimulant, tonic, sedative, astringent, and vulnerary properties. Its stimulant action appears to be directed chiefly to the mucous surfaces of the body. (See Waring, *Pharm. of India*, p. 443, etc.; and F. Porter Smith, *op. cit.* p. 162.)

Common Frankincense or Thus, *Abietis resina*, is the term applied to a resin which exudes from fissures in the bark of the Norway spruce fir, *Abies excelsa*, D. C.; when melted in hot water and strained it constitutes "Burgundy pitch," *Pix abietina*. The concreted turpentine obtained in the United States by making incisions in the trunk of a species of pine, *Pinus australis*, is also so designated. It is commercially known as "scrape," and is similar to the French "galipot" or "barras." Common frankincense is an ingredient in some ointments and plasters, and on account of its pleasant odor when burned has been used in incense as a substitute for olibanum. (See Flückiger and Hanbury, *Pharmacographia.*) The "black frankincense oil" of the Turks is stated by Hanbury (*Science Papers*, p. 142, 1876) to be liquid storax. (F. H. B.)

FRANKLIN. See FREEHOLD.

FRANKLIN, BENJAMIN.

Copyright, 1904, *by The Werner Company.*

FRANKLIN, BENJAMIN, an American printer, philosopher and statesman, born in Milk Street, Boston, Mass., Jan. 6 (old style), Jan. 17 (new style), 1706. He was the youngest son of the youngest son of many generations of Franklins who came of old English stock well known in the shire of Northampton. The name of Franklin appears rather to be of a French than of an English origin. It is certain that the name of Franklin, or Franquelin, is very common in Picardy, especially in the district of Vimeu and Ponthieu. It is very probable that one of Franklin's ancestors was an inhabitant of this region, and went over to England with the fleet of Jean de Biencourt, or that which was fitted out by the nobility of this province. There was at Abbeville, in the fifteenth and sixteenth centuries, a family of the name of Francklin, and John and Thomas Franquelin, woolen drapers, lived there in 1521.

Franklin's father, Josiah, and the grandfather and great-grandfather before him appear to have been blacksmiths, although according to Dr. Franklin's own account of his family, whose pedigree he looked into with great diligence while he was in England, it appears that they were all well born, or gentlemen in the best sense of the word; yet the blacksmith succession was most religiously continued in the family down to the days of Benjamin's father, who in his later life in Boston became a candle and tallow merchant. Josiah and his favorite brother Benjamin had lived on thirty acres of land in Northampton, where they conducted the smithy along with the cultivation of the good, old English soil. They were a pious race, the Franklins, and in the days of Charles II. Josiah and his brother Benjamin, are said to have abandoned the Church of England and espoused the cause of the Dissenters. It was on this account that led Josiah to leave England about the year 1682 and take up his abode in Boston, bringing with him his wife and three children. There were four other children by this wife, and upon her death Josiah married Abiah Folger, a daughter of Peter Folger, who had settled in Watertown in 1635. Folger was a missionary among the Indians and later a Baptist preacher. Ten children were born to Josiah by his second wife, the fifteenth and youngest son being Benjamin, who was destined to become a leading figure in early American history.

Ancestry.

Uncle Benjamin, elder brother of Josiah, was of a literary turn, and early in life collected two quarto volumes of poems, written in shorthand of his own inventing. Being a man of great piety, and fond of listening to the best preachers, whose sermons he always took down, he collected in the course of his life, eight volumes of sermons in folio, besides nearly thirty in quarto and octavo, and all in shorthand. In his seventy-third year, still rugged and strong, he left England and came over to America to see his young brother. On his arrival in Boston he was warmly received by Josiah, who pressed him to spend the remainder of his days in his family. To this proposition the old gentleman readily consented; and the more so as he was then a widower. He had the honor to give his name, and to stand godfather to little Benjamin, for whom, on account of his vivacity and fondness for learning, he conceived an extraordinary affection. It is certain that the bent of Uncle Benjamin's mind had much to do with the shaping of Dr. Franklin's career as journalist and philosopher.

Franklin undoubtedly derived his piety and learning from his father's family; his physical traits from his mother. His clear, sound, common sense and homely philosophy, the most distinguishing qualities of mind which he possessed, he got from his father. The elder Franklin was a wise though not indulgent parent, and the son in his *Autobiography* draws a portrait of him in which he tells us that he was of medium size and finely formed—his complexion fair and ruddy—black, intelligent eyes—and an air uncommonly graceful and spirited. In respect of mind he was a man of the purest piety and morals, and consequently cheerful and amiable in a high degree. He possessed a considerable taste for the fine arts, particularly drawing and music; and having a voice remarkably sonorous and sweet, whenever he sang a hymn accompanied with his violin, which he usually did at the close of his day's labors, it was delightful to hear him. He possessed also an extraordinary sagacity in things relating both to public and private life, insomuch that not only individuals were constantly consulting him about their affairs, and calling him in as an arbiter in their disputes; but even the leading men of Boston would often come and ask his advice in their most important concerns, as well of the town as of the Old South Church where young Benjamin was baptized.

Childhood.

Almost all of the distinguishing features of Franklin's character in life may be traced to his childhood. He was in his earliest days shrewd and artful, industrious and persevering, and of habits most economical. The stories of his recommending his father to say grace over a whole barrel of beef at once; and of his disgust with a favorite whistle, the moment he found he had paid too dear for it, are well known. When at school Franklin distinguished himself among his playfellows by his strength and address, and he was generally the leader in all their schemes. Their great delight was fishing for minnows; and as their constant trampling had made the edge of the pond a quagmire, Franklin's active mind suggested the idea of building a little wharf for them to stand upon. Unluckily a heap of stones was collected, at no great distance, for building a new house; and one evening Franklin proposed to his companions to make free with them after the workmen were gone home. The project was approved, and executed with great industry; but the next morning the stones were missed, and inquiry was made, and the consequence was—a complaint against the boys. Franklin pleaded in excuse the utility of the work; but his father wisely took the opportunity of inculcating the excellent maxim, that what is not honest cannot be useful.

At the age of eight Benjamin was sent to the Boston Grammar School, his father intending him for the church. His Uncle Benjamin, too, greatly approved the idea of making a preacher of him; and by way of encouragement, promised to him all his volumes of sermons, written in his own shorthand. At the age of ten little Benjamin, not over fond of the career marked out for him, longed for the sea and the life of a sailor. Josiah had already lost one son by his running away to sea, and, fearful of losing another, as a sort of compromise, Benjamin was set at "dipping wicks and pouring grease," in his father's chandlery. In his *Autobiography*, Franklin writes of his boyhood period:

"I continued in my father's business for two years, that is, till I was twelve years old; and my brother John, who was

[1] "Es scheint dass selber die Araber ihr eignes Räuchwerk nicht hoch schätzen; denn die Vornehmen in Jemen brauchen gemeiniglich indianisches Räuchwerk, ja eine grosse Menge Mastix von der Insel Scio" (*Beschreibung von Arabien*, p. 143, Kopenh., 1772).

[2] "De Arabibus minus mirum, qui nigricantem colorem, quo Thus Indicum præditum esse vult Dioscorides [lib. i. c. 70], Indum plerumque vocent, ut ex Myrobalano nigro quem Indum appellant, patet" (*op. sup. cit.*, p. 157).

bred to that business, having left my father, married, and set up for himself in Rhode Island, there was all appearance that I was destined to supply his place and become a tallow chandler. But my dislike to the trade continuing, my father was under apprehension that if he did not find one for me more agreeable I would break away * * * to his great vexation. He therefore sometimes took me to walk with him, and see joiners, bricklayers, turners, braziers, etc., at their work that he might observe my inclination and endeavor to fix it on some trade or other. It has ever since been a pleasure to me to see good workmen handle their tools; and it has been useful to me, having learned so much by it as to be able to do little jobs myself in my house when a workman could not readily be got, and to construct little machines for my experiments, while the intention of making the experiment was fresh and warm in my mind. My father at last fixed upon the cutler's trade, and my Uncle Benjamin's son, Samuel, who was bred to that business in London, being about that time established in Boston, I was sent to be with him some time on likiug. But his expectations of a fee with me displeasing my father, I was taken home again."

Franklin from his earliest school days had been fond of books and reading. His first collection was of John Bunyan's works in separate little volumes, and he was enraptured with *Pilgrim's Progress*. These books he sold to enable him to purchase Burton's *Historical Collections*, which, he writes in his *Autobiography*, were "small chapbooks, and cheap, forty or fifty in all." It was at this time that he read *Plutarch's Lives*, De Foe's *An Essay on Projects*, and Cotton Mather's *Essays to Do Good*. These volumes had much influence on the future events of his life.

"This bookish inclination," says his *Autobiography*, "at length determined my father to make me a printer, though he had already one son (James) of that profession. A printer's apprentice. In 1717 my brother James returned from England with a press and letters, to set up his business in Boston. I liked it much better than that of my father, but still had a hankering for the sea. To prevent the apprehended effect of such an inclination, my father was impatient to have me bound to my brother. I stood out some time but at last was persuaded and signed the indentures when I was yet but twelve years old. I was to serve as an apprentice till I was twenty-one years of age, only I was to be allowed journeyman's wages during the last year. In a little time, I made great proficiency in the business and became a useful hand to my brother. I now had access to better books. An acquaintance with the apprentices of booksellers enabled me sometimes to borrow a small one, which I was careful to return soon and clean. Often I sat up in my room reading the greatest part of the night, when the book was borrowed in the evening and to be returned early in the morning, lest it should be missed or wanted."

After much reading, young Franklin, while serving his apprenticeship, was ambitious to put his own thoughts on paper and first turned to versification. One of his poems was called *The Lighthouse Tragedy*, and contained an account of the shipwreck of Captain Worthilake with his two daughters; the other was a sailor's song on the taking of the famous Teach, or Blackbeard, the pirate. "They were wretched stuff," he afterward wrote, in street ballad style; and when they were printed my brother sent me about the street to sell them. The first sold prodigiously, the event being recent, and having made a great noise. This success flattered my vanity; but my father discouraged me by criticising my performances, and telling me verse-makers were generally beggars. Thus I escaped being a poet, and probably a very bad one." He then turned to prose, and by the aid of his father and an odd volume of the *Spectator*, succeeded in correcting his faults of composition and made rapid progress. Three years after he was apprenticed he obtained a book on vegetable diet, and, with some liking for the perverse, became a vegetarian. In this way he saved part of the expense of his board, and got a little money for books. From reading Xenophon's *Memorable Things of Socrates*, he took up the Socrates method of disputation which helped to crystallize his style.

In 1720 James Franklin, printer, established *The New England Courant*, the third newspaper in the colonies, and Benjamin, unbeknown to his brother, wrote occasional pieces for it which he secretly placed under the door of the office. These were accepted and printed without their authorship being discovered. Encouraged by his success, he wrote on, and sent to the press, in the same way, several other pieces, which were equally approved, keeping the secret till his slender stock of information was pretty completely exhausted, when he came out with the real author. His brother, on this discovery, began to entertain a little more respect for him, but still looked on and treated him as a common apprentice. Ben, on the other hand, thought that, as a brother, he had a right to greater indulgence. Thi difference in opinion rose to disputes, which were often brought before their father, who generally gave way to Benjamin. James could not bear these awards of his father in favor of a younger brother, but would fly into a passion and treat him with abuse, even to blows. Ben took this tyrannical behavior of his brother in extremely ill part; and he somewhere says that it imprinted on his mind that deep-rooted aversion to arbitrary power, which he never lost, and which rendered him through life such a firm and unconquerable enemy of oppression. His apprenticeship became insupportable and finally in October, 1723, he secretly set sail on a sloop for New York. Finding no employment in New York he pushed on to Perth Amboy by boat and from thence walked to Philadelphia, arriving there very tired and very hungry with only a Dutch dollar and a shilling in his pocket. Removal to Philadelphia.

He found two printers in Philadelphia. Bradford and Keimer, and with the latter he secured employment. In a few months through Keimer he became acquainted with Sir William Keith, governor of the province, who after a time urged the young printer to set up in business for himself. Keith sent him to Boston with a letter to the elder Franklin asking financial assistance. There was a pronounced development of character in the youth at this time, and the story is told, how in his journey to Boston he stopped at a village inn, the landlord of which was impertinent and inquisitive. Franklin had scarcely set himself down to supper when his landlord began to torment him with questions. He, well knowing the disposition of these people, and knowing that answering one question, would only pave the way for twenty more, determined to stop the landlord at once by requesting to see his wife, children and servants, in short, the whole of his household. When they were summoned, Franklin, with an arch solemnity, said: "My good friends, I sent for you here to give an account of myself; my name is Benjamin Franklin; I am a printer, of nineteen years of age; reside at Philadelphia, and am now going to Boston. I sent for you all, that if you wish for any further particulars you may ask, and I will inform you; which done, I hope that you will permit me to eat my supper in peace."

In Boston he met with no encouragement from his father, and was sent back to Philadelphia empty-handed. He reported his failure to Governor Keith, who with much pomp and bluster asked him to make an inventory of the things needed in a printing shop and finally urged him to go to England for the purpose of purchasing the stock at the Governor's expense. The promised letters of introduction and credit were not forthcoming before the ship sailed from Philadelphia, but being assured by Sir William that they would be sent, Franklin sailed, only to find that Keith was not a man of his word. For eighteen months the young printer struggled in London. While there he was persuaded by a merchant, a worthy Quaker, named Denham, to return to Philadelphia and enter his employ as a clerk, and on July 23rd, 1726, they embarked for America. Franklin was now approaching his majority and thus far had failed at his trade. He had worked five years in Boston, three in Philadelphia and nearly two years in London, and now in his twenty-first year, after working without ceasing and practicing rigid economy, he was as indigent as when he began.

The relation between Denham and young Franklin proved of short duration, for the Quaker merchant died in the February following their arrival from England, and Franklin re-entered the employ of Keimer, resuming his trade of the types. A few months later he set up in business for himself with one Meredith, and in October, 1729, they issued the *Pennsylvania Gazette*, a newspaper purchased from Keimer. In this paper Franklin originated the modern system of business advertising that has since grown to such enormous proportions. The following year, on September 1, the young publisher was married to Miss Deborah Reed, whom he had met during his first year in Philadelphia. Marriage. He was but twenty-four years of age, and had now reached the turning point in his career. We have sketched rather fully his early life inasmuch as the vicissitudes and struggles of boyhood and youth had important bearing on his character and purpose. With his marriage his public career of usefulness began. He was a self-educated man, of breadth of mind, originality, sound judgment and remarkable common-sense. At once he began to practice thrift, correct living and tranquillity of mind. He was soon to become public-spirited, influential and successful. In 1731 he founded a subscription library and by the advent of 1732 began to acquire some wealth through his own industry and frugality and that of his wife who folded and stitched pamphlets and tended shop. He considered himself fortunate in having such a wife and often quoted the old English proverb: "He that would thrive, must first ask his wife."

"Industry was the keynote of his life as boy, as youth and man, and in his memoirs, he is particularly anxious to inculcate the duties of industry in order that his posterity may know the use of a virtue, to which he was so largely indebted. Throughout the whole of his long life, his precept was strengthened by an example of the most remarkable industry, of which he furnishes many instances. When a printer, he was engaged in a work of forty sheets, on which he worked exceedingly hard, for the price was low. 'I composed,' says he, 'a sheet a day, and Meredith worked it off at press; it was often eleven at night, and sometimes later, before I had finished my distribution for the next day's work; for the little jobs sent in by our other friends, now and then, put us

back. But so determined was I to continue doing a sheet a day of the folio, that one night when having imposed my forms, and I thought my day's work over, one of them by accident was broken, and two pages were reduced to pie (a printer's term for the type getting mixed and in confusion), I immediately distributed and composed it over again before I went to bed; and this industry, visible to our neighbors, began to give us character and credit; particularly, I was told that mention was being made of the new printing office, at the Merchants' Every-night club.'"

It was in 1732 that Franklin first published his *Almanac* under the imprint of Richard Saunders, and it was continued by him as *Poor Richard's Almanac* for twenty-five years. It was the comic almanac of the time and proved a great success. It was one of the most influential publications in the world, being reprinted in Great Britain, and translated into French and distributed among the poor. Charles Fox used to say, that had Franklin written nothing else, his *Poor Richard's Almanac* was alone sufficient to immortalize him. His maxims, famous now as then throughout the world, were largely upon temperance, industry, and frugality. His advice to a young tradesman is well-worth repeating here:

"Poor Richard's Almanac."

"Remember that time is money. He that can earn ten shillings a day, by his labor, and goes abroad, or sits idle one-half of that day, though he spends but sixpence during his diversion or idleness, ought not to reckon that the only expense; he has really spent, or rather thrown away five shillings besides.

"Remember that credit is money. If a man lets his money be in my hands, after it is due, he gives me the interest, or so much as I can make of it, during that time. This amounts to a considerable sum where a man has good and large credit, and makes good use of it.

"Remember that money is of a very breeding prolific nature. Money begets money; and its offspring can beget more; and so on. Five shillings turned is six. Turned again it is seven and threepence; and so on, till it becomes hundreds and thousands of pounds. The more there is of it, the more it produces every turning; so that the profits rise quicker and quicker. He, who kills a breeding sow, destroys all her offspring, to the thousandth generation. He who murders a crown, destroys all that it might have produced; even scores of pounds.

"Remember that six pounds a year is but a groat a day. For this little sum, which may be daily wasted either in time or expense, unperceived, a man of credit may, on his own security, have the constant possession and use of an hundred pounds. So much in stock, briskly turned by an industrious man, produces great advantages.

"Remember this saying 'The good paymaster is lord of another man's purse!' He who is known to pay punctually and exactly to the time he promises, may, at any time, and on any occasion, raise all the money his friends can spare. This is sometimes of great use. After industry and frugality, nothing contributes more to the raising of a young man in the world, than punctuality and justice in all his dealings. Therefore never keep borrowed money an hour beyond the time you promised, lest a disappointment shut up your friend's purse for ever."

Franklin's career from this time was one of rapid progression and subsequent public recognition. In 1733 he began the study of languages, had some mastery of French and acquired a reading knowledge of Italian, Spanish, and Latin. In 1736 he was elected Clerk of the General Assembly and the next year was appointed Deputy Postmaster-General. He was instrumental in organizing a regular police patrol in Philadelphia, and formed the Union Fire Company, the first of its kind in America. He invented the Franklin stove, or Pennsylvania fireplace. In 1744 he founded the American Philosophical Society and later agitated the matter of an Academy, which eventually resulted in the University of Pennsylvania. Meanwhile his mind ran to scientific themes and he became a student of nature. He was a careful observer of ants and made interesting discoveries about them. He also made the discovery that the northeast storms moved backward, that is, from southwest to northeast. In the field of electrical research he made numerous and valuable discoveries. He found the power of metallic points to draw off electrical matter, he discovered a positive and a negative state of electricity, he explained on electrical principles the phenomena of the famous Leyden vial, he explained the phenomena of the aurora borealis, and of thunder gusts, he showed the striking resemblance in many respects between electricity and lightning and made his famous experiments with the lightning and an ordinary kite on the commons back of Philadelphia.

Franklin the Inventor.

About the year 1753, Franklin began to play an important part in the conduct of colonial affairs. He visited New England upon various political missions, while there receiving degrees from Yale and Harvard in recognition of his electrical discoveries. The following year he was sent as commissioner from Pennsylvania to the Congress in Albany, where he brought forth the first coherent scheme ever propounded for securing a permanent Federal union of the thirteen colonies. But public opinion was not yet ripe for the adoption of the bold and comprehensive ideas which it contained, and in consequence, it was rejected. In 1755, by the steadfast personal exertions of Franklin, General Braddock was enabled to obtain horses, wagons, and provisions for his expedition. For the payment of these Franklin pledged his own property, and by the failure of the expedition he found himself heavily in debt. Meanwhile the troubles between the colonies and the mother country became acute, and in 1757 Franklin was sent over to England as agent for Pennsylvania, to plead the cause of the Assembly before the privy council. The duties of the position kept him five years in England. His discoveries and writings had won him a European reputation, and in 1762 he received the degree of LL.D. from the Universities of Oxford and Edinburgh. He returned to Philadelphia now a prominent figure in colonial politics, and two years later, in 1764, he was again sent to England as the agent for Pennsylvania, and was instructed to make every effort to prevent the passage of the Stamp Act. But when the obnoxious measure was passed in 1765, Franklin counselled submission. "In this case, however, the wisdom of this wisest of Americans proved inferior to the 'collective wisdom' of his fellow-countrymen." The Stamp Act was soon repealed, and Franklin's testimony, in which was evinced his strong sense and varied knowledge, contributed greatly to the desired result. When the demand was made on Massachusetts for the payment of the tea destroyed in Boston Harbor, Franklin went so far as to advise Massachusetts to make the payment, fearing that war would result if it were refused. Samuel Adams, on hearing of this, said: "Franklin may be a good philosopher, but he is a bungling politician." In this instance Franklin showed himself less far-sighted than Adams and the people of Massachusetts. After using all his efforts at conciliation between the King and the colonies, which he found fruitless, he returned to America, arriving in Philadelphia, May 5th, 1775, to find the war had actually begun, the battles of Lexington and Concord having already been fought. In the meantime his faithful wife had passed away.

Colonial agent in England.

The breach between England and the American colonies raised a barrier between Franklin and his many friends in England. Under date of July 5th, 1775, Dr. Franklin wrote his famous letter to William Strahan, his friend for many years:

"MR. STRAHAN:

"You are a member of Parliament, and one of that Majority which has doomed my Country to Destruction. You have begun to burn our towns, and murder our People — Look upon your hands! — They are stained with the Blood of your Relations! — You and I were long Friends: — You are now my Enemy, — and I am

Yours,

"B. FRANKLIN."

Having been elected a delegate to the Second Continental Congress, Franklin was instrumental in organizing the army, navy, and finances of the new government. He drew up a plan of union for the colonies which he presented July 21st, 1775, which is called the "First Sketch of a Plan of Confederation which is known to have been presented to Congress." Not only did he serve in Congress, but was placed in charge of the postal service and was made chairman of the provincial committee of safety to organize Pennsylvania for war. When Samuel Adams proposed his plan for a confederation of the colonies, which did not meet with general approval, that sturdy patriot said: "If none of the rest will join, I will endeavor to unite the New England colonies in confederating." Franklin said to Adams: "I approve your proposal, and if you succeed I will cast in my lot among you." Franklin earnestly supported the proposition for a Declaration of Independence, and affixed his signature to it on July 4th, 1776.

Immediately upon the declaration of independence, Franklin and a committee prepared a number of very masterly addresses to the courts of Europe, informing what the United States had done; assigning their reasons for so doing, and tendering in the most affectionate terms, the friendship and trade of the young nation. In August, Franklin was appointed envoy to the French court, and arriving in Paris he was found to enjoy a reputation, according to John Adams, greater than either Leibnitz, Newton, Frederick, or Voltaire. In order not to embarrass the government, he established himself in the suburb of Passy. He lived plainly but comfortably, although he was accused by John Adams of extravagance. Personally, Franklin was at this time an unique figure. Cochin, the artist, who made the famous "fur-cap portrait" of Franklin a few weeks after his arrival in Paris, writes this to a friend in Europe: "Figure to yourself an old man with gray hair, appearing under a martin fur cap, among the powdered heads of Paris. It is this odd figure that salutes you with handfuls of blessings on you and your little ones." Three days later the French police enter this description on their records: "Dr. Franklin lately arrived in this country. This Quaker wears the full costume of his sect. He has an agreeable physiognomy, spectacles always on his eyes, but little hair; a fur cap is always on his head. He wears no powder; tidy in his dress; very white linen. His only defence is a walking stick."

Envoy to France.

The Quaker envoy had not been long in France before the attention of all the courts of Europe was attracted to him, by

a publication, wherein he demonstrated that, "the young, healthy, and sturdy republic of America, with her simple manners, laborious habits, and millions of fresh land and produce, would be a much safer borrower of money, than the old, profligate, and debt-burthened government of Britain." The Dutch and French courts, in particular, read his arguments with such attention, that they soon began to make him loans. To the French Cabinet he pointed out, "the inevitable destruction of their fleets, colonies, and commerce, in case of a reunion of Britain and America." In 1782, after the signing of the treaty with France, Franklin resigned, but Congress kept him there until March, 1785, when it voted his return. The three years were spent by Franklin in making commercial treaties with Sweden, Denmark, Portugal, Morocco and Prussia. The treaty with Prussia called for the abolishment of privateering. Jefferson succeeded Franklin, and when he was asked "C'est vous, Monsieur, qui remplace le Docteur Franklin?" he replied: "No one can replace him, sir; I am only his successor." Indeed, even his enemies had high respect for Dr. Franklin. The year before his return from France he wrote to his distinguished friend, John Jay:

"I have, as you observe, some enemies in England, but they are my enemies as an American. I have also two or three in America who are my enemies as a minister, but I thank God there are not in the whole world any who are my enemies as a man, for by His grace, through a long life, I have been enabled so to conduct myself that there does not exist a human being who can justly say, 'Benjamin Franklin has wronged me.' This, my friend, is in old age a comfortable reflection."

Return to America.

When Franklin returned to Philadelphia, arriving there September 14th, 1785, he was received with the enthusiasm of his people and was made to feel that his services abroad were duly appreciated. He was now nearly eighty years of age and while he was thrice elected president of Pennsylvania and was a delegate to the Federal Constitutional Convention, he lived a quiet life, surrounded by his daughter and her family, his friends and his books. He wrote occasionally for the newspapers and in a letter to the *Pennsylvania Gazette*, he advocated the transportation of American felons to England, as English felons had been before transported to America. "No due returns," he wrote, "have yet been made for these valuable consignments." In 1786 he wrote to a friend in Boston of the manner in which he passed his declining years. He had been so persistent a worker that he had some compunction about being idle; "but another reflection," he says, "comes to relieve me, whispering, You know that the soul is immortal; why then should you be such a niggard of a little time, when you have a whole eternity before you?" When the Constitutional Convention of May, 1787, was opened, Franklin proposed that the proceedings should begin with prayer. "If a sparrow cannot fall without God's knowledge," he said, "how can an Empire rise without His aid?" This deep conviction which came to him late in life, was further expressed in a letter to Thomas Paine, who was planning his famous *Age of Reason*, Franklin wrote to him: "I would advise you not to attempt unchaining the tiger, but to burn this piece before it is seen by any other person. If men are so wicked with religion, what would they be without it?" At the age of eighty-one he was elected to his last office, being a third time president of Pennsylvania, and at this period he said of himself: "I seem to have intruded myself into the company of posterity, when I ought to have been abed and asleep."

At the age of eighty-two, feeble in body, yet still vigorous in mind, he made his last public speech, before the Federal Constitutional Convention, over which Washington presided. It is a speech showing the charm of modesty in a great man and is noted for its temperance and cheerfulness:

His last public speech.

"Mr. President:

"I do not entirely approve this constitution at present, but, sir, I am not sure I shall never approve it; for, having lived long, I have experienced many instances of being obliged, by better information, to change opinions which I once thought right. It is, therefore, that the older that I grow, the more apt I am to doubt my own judgment, and to pay more respect to the judgment of others. Most men, indeed, as well as most sects of religion, think themselves in possession of all truth, and that whenever others differ from them, it is so far error. Steele, a Protestant, tells the pope that the 'only difference between our two churches, in the opinion of the certainty of their doctrines, is, the Romish church is infallible, and the Church of England never in the wrong.'

"But though many private persons think almost as highly of their own infallibility, as of that of their sect, few express it so naturally as a certain French lady, who, in a little dispute with her sister, said: 'I don't know how it happens, sister, but I meet with nobody but myself that is always in the right.' In these sentiments, sir, I agree to this constitutiou, with all its faults, if they are such; because I think a general government necessary for us, and there is no form of government but what may be a blessing, if well administered; and I believe, farther, that this is likely to be well administered for a course of years, and can only end in despotism, as other forms have done before it, when the people shall become so corrupted, as to need despotic government, being incapable of any other. I doubt, too, whether any other convention we can obtain, may be able to make a better constitution. For when you assemble a number of men to have the advantage of their joint wisdom, you assemble with those men all their prejudices, their passions, their errors of opinion, their local interests, and their selfish views. From such an assembly, can a perfect production be expected? It therefore astonishes me, sir, to find this system approaching so near to perfection as it does; and I think it will confound our enemies, who are waiting in confideuce, to hear that our councils are confounded like those of the builders of Babel and that our states are on the point of separation, only to meet hereafter for the purpose of cutting each other's throats. Thus I consent, sir, to this constitution, because I expect no better, and because I am not sure that this is not the best. The opinions I have had of its errors I sacrifice to the public good. I have never whispered a syllable of them abroad. Within these walls they were born, and here they shall die. If every one of us, in returning to our constituents, were to report the objections he has had to it, and endeavor to gain partisans in support of them, we might prevent its being generally received, and thereby lose all the great advantages resultiug naturally in our favor among foreign nations, as well as among ourselves, from our real or apparent unanimity. Much of the efficiency of any government, in procuring and securing happiness to the people, depends on the general opinion of the goodness of that government, as well as the wisdom and integrity of the governors.

"I hope, therefore, that for our own sakes, as a part of the people, and for the sake of our prosperity, we shall act heartily and unanimously, in recommending this constitution, wherever our influence may extend, and turn our future thoughts and endeavors to the means of having it well administered.

"On the whole, sir, I cannot help expressing the wish, that every member of the convention who may still have objections, would, with me, on this occasion, doubt a little of his own infallibility, and making manifest our unanimity, put his name to this instrument."

One of the final acts in Franklin's long public career was the writing of a Memorial to Congress protesting against slavery, and as late as March 23rd, 1790, he wrote a characteristic answer to a pro-slavery speech in Congress. He died in Philadelphia April 17th, 1790, aged eighty-four years and three months.

Benjamin Franklin; a Critical Estimate.

BY JOHN BIGELOW.

Copyright, 1897, by R. S. Peale and J. A. Hill.

The youngest son of the seventeen children of a Boston tallow-chandler named Franklin was born a subject of Queen Anne of England, on the 6th of January, 1706; and on the same day received the baptismal name of Benjamin at the Old South Church in that city. He continued for more than seventy of the eighty-four years of his life a subject of four successive British monarchs. During that period, neither Anne nor either of the three Georges who succeeded her had a subject of whom they had more reason to be proud, nor one whom at his death their people generally supposed they had more reason to detest. No Englishman of his generation can now be said to have established a more enduring fame, in any way, than Franklin established in many ways. As a printer, as a journalist, as a diplomatist, as a statesman, as a philosopher, he was easily first among his peers.

On the other hand, it is no disparagement of the services of any of his contemporaries on either side of the Atlantic, to say that no one of his generation contributed more effectually to the dissolution of the bonds which united the principal British-American colonies to the mother country, and towards conferring upon them independence and a popular government.

Local influence.

As a practical printer Franklin was reported to have had no superiors; as a journalist he exerted an influence not only unrivaled in his day, but more potent, on this continent at least, than either of his sovereigns or their Parliaments. The organization of a police, and later of the militia, for Philadelphia; of companies for extinguishing fires; making the sweeping and paving of the streets a municipal function; the formation of the first public library for Philadelphia, and the establishment of an academy which has matured into the now famous University of Pennsylvania, were among the conspicuous reforms which he planted and watered in the columns of the Philadelphia *Gazette*. This journal he founded; upon the earnings of it he mainly subsisted during a long life, and any sheet of it to-day would bring a larger price in the open market probably than a single sheet of any other periodical ever published.

Franklin's *Almanack*, his crowning work in the sphere of journalism, published under the pseudonym of Richard Saunders,—better known since as Poor Richard,—is still one of the marvels of modern literature. Under one or another of many titles the contents of this publication, exclusive of its calendars, have been translated into every tongue having any pretensions to a literature; and have had more

readers, probably, than any other publication in the English or indeed in any other language, with the single exception of the Bible. It was the first issue from an American press that found a popular welcome in foreign lands, and it still enjoys the special distinction of being the only almanac ever published that owed its extraordinary popularity entirely to its literary merit.

Literary labors.

What adds to the surprise with which we contemplate the fame and fortunes of this unpretentious publication, is the fact that its reputation was established by its first number, and when its author was only twenty-six years of age. For a period of twenty-six years, and until Franklin ceased to edit it, this annual was looked forward to by a larger portion of the colonial population and with more impatience than now awaits a President's annual message to Congress.

Franklin graduated from journalism into diplomacy as naturally as winter glides into spring. This was simply because he was by common acclaim the fittest man for any kind of public service the colony possessed, and especially for any duty requiring talents for persuasion, in which he proved himself to be unquestionably past master among the diplomatists of his time.

The question of taxing the Penn proprietary estates in Pennsylvania, for the defense of the province from the French and Indians, had assumed such an acute stage in 1757 that the Assembly decided to petition the King upon the subject; and selected Franklin, then in the forty-first year of his age, to visit London and present their petition. The next forty-one years of his life were practically all spent in the diplomatic service. He was five years absent on this his first mission. Every interest in London was against him. He finally surmounted all obstacles by a compromise, which pledged the Assembly to pass an act exempting from taxation the unsurveyed lands of the Penn estate,—the surveyed waste lands, however, to be assessed at the usual rate. For his success the Penns and their partisans never forgave him, and his fellow colonists never forgot him.

Diplomatic service.

Franklin returned to Philadelphia in 1762, but not to remain. The question of taxing the colonies without representation was soon thrust upon them in the shape of a stamp duty, and Franklin was sent out again to urge its repeal. He reached London in November, 1764, where he remained the next eleven years and until it became apparent that the surrender of the right to arbitrarily tax the colonies would never be made by England during the life of the reigning sovereign, George III. Satisfied that his usefulness in England was at an end, he sailed for Philadelphia on the 21st of March, 1775; and on the morning of his arrival was elected by the Assembly of Pennsylvania a delegate to the Continental Congress, which consolidated the armies of the colonies, placed General George Washington in command of them, issued the first Continental currency, and assumed the responsibility of resisting the imperial government; his last hope of maintaining the integrity of the empire having been dissipated by recent collisions between the people and the royalist troops at Concord and Lexington. Franklin served on ten committees in this Congress. He was one of the five who drew up the Declaration of Independence in July, 1776, and in September following was chosen unanimously as one of the three commissioners to be sent out to solicit for the infant republic the aid of France and the sympathies of continental Europe. In this mission, the importance of which to his country can hardly be exaggerated, he was greatly favored by the reputation which had preceded him as a man of science. While yet a journalist he had made some experiments in electricity, which established its identity with lightning. The publication by an English correspondent of the letters in which he gave an account of these experiments, secured his election as an honorary member of the Royal Society of London and undisputed rank among the most eminent natural philosophers of his time. When he arrived in Paris, therefore, he was already a member of every important learned society in Europe, one of the managers of the Royal Society of London, and one of the eight foreign members of the Royal Academy in Paris, where three editions of his scientific writings had already been printed. To these advantages must be added another of even greater weight: his errand there was to assist in dismembering the British Empire, than which nothing of a political nature was at this time much nearer every Frenchman's heart.

Statesman and scientist.

The history of this mission, and how Franklin succeeded in procuring from the French King financial aid to the amount of twenty-six millions of francs, at times when the very existence of the republic depended upon them, and finally a treaty of peace more favorable to his country than either England or France wished to concede, has been often told; and there is no chapter in the chronicles of this republic with which the world is more familiar.

Franklin's reputation grew with his success. "It was," wrote his colleague John Adams, "more universal than that of Leibnitz or Newton, Frederick the Great or Voltaire, and his character more beloved and esteemed than all of them. . . . If a collection could be made of all the gazettes of Europe for the latter half of the eighteenth century, a greater number of panegyrical paragraphs upon *le grand Franklin* would appear, it is believed, than upon any other man that ever lived."

World-wide fame.

A few weeks after signing the definitive treaty of peace in 1783, Franklin renewed an application which he had previously made just after signing the preliminary treaty, to be relieved of his mission; but it was not until the 7th of March, 1785, that Congress adopted a resolution permitting "the Honorable Benjamin Franklin to return to America as soon as convenient." Three days later, Thomas Jefferson was appointed to succeed him.

On the 13th of September, 1785, and after a sojourn of nearly nine years in the French capital, first in the capacity of commissioner and subsequently of minister plenipotentiary, Franklin once more landed in Philadelphia, on the same wharf on which, sixty-two years before, he had stepped, a friendless and practically penniless runaway apprentice of seventeen.

Though now in his seventy-ninth year, and a prey to infirmities not the necessary incidents of old age, he had scarcely unpacked his trunks after his return when he was chosen a member of the municipal council of Philadelphia, and its chairman. Shortly after, he was elected president of Pennsylvania, his own vote only lacking to make the vote unanimous. "I have not firmness," he wrote to a friend, "to resist the unanimous desire of my countryfolks; and I find myself harnessed again into their service another year. They engrossed the prime of my life; they have eaten my flesh, and seem resolved now to pick my bones."

He was unanimously re-elected to this dignity for the two succeeding years, and while holding that office was chosen a member of the convention which met in May, 1787, to frame the Constitution under which the people of the United States are still living.

Framing the Constitution.

With the adoption of that instrument, to which he probably contributed as much as any other individual, he retired from official life; though not from the service of the public, to which for the remaining years of his stay on earth his genius and his talents were faithfully consecrated.

Among the fruits of that unfamiliar leisure, always to be remembered among the noblest achievements of his illustrious career, was the part he had in organizing the first anti-slavery society in the world; and as its president, writing and signing the first remonstrance against slavery ever addressed to the Congress of the United States.

In surveying the life of Dr. Franklin as a whole, the thing that most impresses one is his constant study and singleness of purpose to promote the welfare of human society. It was his daily theme as a journalist, and his yearly theme as an almanac-maker. It is that which first occurs to us when we recall his career as a member of the Colonial Assembly; as an agent of the provinces in England; as a diplomatist in France; and as a member of the conventions which crowned the consistent labors of his long life. Nor are there any now so bold as to affirm that there was any other person who could have been depended upon to accomplish for his country or the world, what Franklin did in any of the several stages of his versatile career.

Though holding office for more than half of his life, the office always sought Franklin, not Franklin the office. When sent to England as the agent of the colony, he withdrew from business with a modest competence judiciously invested mostly in real estate. He never seems to have given a thought to its increase. Frugal in his habits, simple in his tastes, wise in his indulgences, he died with a fortune neither too large nor too small for his fame as a citizen or a patriot. For teaching frugality and economy to the colonists, when frugality and economy were indispensable to the conservation of their independence and manhood, he has been sneered at as the teacher of a "candle-end-saving philosophy," and his *Poor Richard* as a "collection of receipts for laying up treasures on earth rather than in heaven." Franklin never taught, either by precept or example, to lay up treasures on earth. He taught the virtues of industry, thrift, and economy, as the virtues supremely important in his time, to keep people out of debt and to provide the means of educating and dignifying society. He never countenanced the accumulation of wealth for its own sake, but for its uses,—its prompt convertibility into social comforts and refinements. It would be difficult to name another man of any age to whom an ambition to accumulate wealth as an end could be imputed with less propriety. Though probably the most inventive genius of his age, and thus indirectly the founder of many fortunes, he never asked a patent for any of his inventions or discoveries. Though one of the best writers of the English language that his country has yet produced, he never wrote a line for money after he withdrew from the calling by which he made a modest provision for his family.

Personal traits.

For the remaining half of his life both at home and abroad, though constantly operating upon public opinion by his pen,

he never availed himself of a copyright or received a penny from any publisher or patron for any of these labors. In none of the public positions which he held, even when minister plenipotentiary, did his pay equal his expenditures. He was three years president of Pennsylvania after his return from France, and for his services declined to appropriate to his own use anything beyond his necessary expenditures for stationery, postage, and transportation. It is not by such methods that men justly incur the implied reproach of "laying up treasures on earth," or of teaching a candle-end-saving philosophy.

Honest economy.

Franklin courted fame no more than fortune. The best of his writings, after his retirement from journalism, he never gave to the press at all; not even his incomparable autobiography, which is still republished more frequently than any of the writings of Dickens or of Thackeray. He always wrote for a larger purpose than mere personal gratification of any kind. Even his bagatelles and *jeux d'esprit* read in the salons of Paris, though apparently intended for the eyes of a small circle, were inspired by a desire to make friends and create respect for the struggling people and the great cause he represented. Few if any of them got into print until many years after his decease.

Franklin was from his youth up a leader, a lion in whatever circle he entered, whether in a printing-house, the provincial Assemblies, as agent in England, or as a courtier in France. There was no one too eminent in science or literature, on either side of the Atlantic, not to esteem his acquaintance a privilege. He was an honorary member of every important scientific association in the world, and in friendly correspondence with most of those who conferred upon those bodies any distinction; and all this by force of a personal, not to say planetary, attraction that no one brought within his sphere could long resist.

Pretty much all of importance that we know of Franklin we gather from his private correspondence. His contemporaries wrote or at least printed very little about him; scarcely one of the multitude whose names he embalmed in his *Autobiography* ever printed a line about him. All that we know of the later half of his life not covered by his autobiography, we owe almost exclusively to his private and official correspondence. Though reckoning among his warm friends and correspondents such men as David Hume, Dr. Joseph Priestley, Dr. Price, Lord Kames, Lord Chatham, Dr. Fothergill, Peter Collinson, Edmund Burke, the Bishop of St. Asaph and his gifted daughters, Voltaire, the habitués of the Helvétius salon, the Marquis de Ségur, the Count de Vergennes, his near neighbors De Chaumont and Le Veillard, the *maire* of Passy,—all that we learn of his achievements, of his conversation, of his daily life, from these or many other associates of only less prominence in the Old World, might be written on a single foolscap sheet. Nor are we under much greater obligations to his American friends. It is to his own letters (and except his *Autobiography*, he can hardly be said to have written anything in any other than the epistolary form; and that was written in the form of a letter to his son William, and most of it only began to be published a quarter of a century after his death) that we must turn to learn how full of interest and importance to mankind was this last half-century of his life. Beyond keeping copies of his correspondence, which his official character made a duty as well as a necessity, he appears to have taken no precautions to insure the posthumous fame to which his correspondence during that period was destined to contribute so much. Hence, all the biographies—and they are numberless—owe almost their entire interest and value to his own pen. All, so far as they are biographies, are autobiographies; and for that reason it may be fairly said that all of them are interesting.

Friendships.

It is also quite remarkable that though Franklin's life was a continuous warfare, he had no personal enemies. His extraordinary and even intimate experience of every phase of human life, from the very lowest to the very highest, had made him so tolerant that he regarded differences of opinion and of habits much as he regarded the changes of the weather,—as good or bad for his purposes, but which, though he might sometimes deplore, he had no right to quarrel with or assume personal responsibility for. Hence he never said or did things personally offensive. The causes that he represented had enemies, for he was all his life a reformer. All men who are good for anything have such enemies. "I have, as you observe," wrote Franklin to John Jay the year that he retired from the French mission, "some enemies in England, but they are my enemies as an American; I have also two or three in America who are my enemies as a minister; but I thank God there are not in the whole world any who are my enemies as a man: for by his grace, through a long life, I have been enabled so to conduct myself that there does not exist a human being who can justly say, 'Ben Franklin has wronged me.' This, my friend, is in old age a comfortable reflection. You too have or may have your enemies; but let not that render you unhappy. If you make a right use of them, they will do you more good than harm. They point out to us our faults; they put us upon our guard and help us to live more correctly."

A man without enemies.

Franklin's place in literature as a writer has not been generally appreciated, probably because with him writing was only a means, never an end, and his ends always dwarfed his means, however effective. He wrote to persuade others, never to parade his literary skill. He never wrote a dull line, and was never *nimious*. The longest production of his pen was his autobiography, written during the closing years of his life. Nearly all that he wrote besides was in the form of letters, which would hardly average three octavo pages in length. And yet whatever the subject he touched upon, he never left the impression of incompleteness or of inconclusiveness. Of him may be said, perhaps with as much propriety as any other man, that he never said a word too soon, nor a word too late, nor a word too much. Tons of paper have been devoted to dissuasives from dueling, but the argument was never put more effectively than Franklin put it in these dozen lines of a letter to a Mr. Percival, who had sent him a volume of literary and moral dissertations.

"A gentleman in a coffee-house desired another to sit further from him. 'Why so?'—'Because you stink.'—'That is an affront, and you must fight me.'—'I will fight you if you insist upon it, but I do not see how that will mend the matter. For if you kill me, I shall stink too; and if I kill you, you will stink, if possible, worse than at present.' How can such miserable sinners as we are, entertain so much pride as to conceit that every offense against our imagined honor merits death? These petty princes, in their opinion, would call that sovereign a tyrant who should put one of them to death for a little uncivil language, though pointed at his sacred person; yet every one of them makes himself judge in his own cause, condemns the offender without a jury, and undertakes himself to be the executioner."

Some one wrote him that the people in England were abusing the Americans and speaking all manner of evil against them. Franklin replied that this was natural enough:

"They impute to us the evil they wished us. They are angry with us, and speak all manner of evil of us; but we flourish notwithstanding. They put me in mind of a violent High Church factor, resident in Boston when I was a boy. He had bought upon speculation a Connecticut cargo of onions which he flattered himself he might sell again to great profit; but the price fell, and they lay upon his hands. He was heartily vexed with his bargain, especially when he observed they began to grow in his store he had filled with them. He showed them one day to a friend. 'Here they are,' said he, 'and they are growing too. I damn them every day, but I think they are like the Presbyterians; the more I curse them, the more they grow.'"

Positive convictions.

Mr. Jefferson tells us that Franklin was sitting by his side in the convention while the delegates were picking his famous Declaration of Independence to pieces, and seeing how Jefferson was squirming under their mutilations, comforted him with the following stories, the rare excellence of which has given them a currency which has long since worn off their novelty:

"'I have made it a rule,' said he, 'whenever in my power, to avoid becoming the draftsman of papers to be reviewed by a public body. I took my lesson from an incident which I will relate to you.

"'When I was a journeyman printer, one of my companions, an apprenticed hatter, having served out his time, was about to open shop for himself. His first concern was to have a handsome sign-board with the proper inscription. He composed it in these words: *John Thompson, Hatter, makes and sells Hats for ready Money*, with a figure of a hat subjoined. But he thought he would submit it to his friends for their amendments. The first he showed it to thought the word *hatter* tautologous, because followed by the words *makes hats*, which showed he was a hatter. It was struck out. The next observed that the work *makes* might as well be omitted, because his customers would not care who made the hats; if good and to their mind, they would buy, by whomsoever made. He struck it out. A third said he thought the words *for ready money* were useless, as it was not the custom of the place to sell on credit: every one who purchased expected to pay. They were parted with, and the inscription now stood, *John Thompson sells hats.* "*Sells* hats," says his next friend; "why, nobody will expect you to give them away. What then is the use of that word?" It was stricken out, and *hats* followed, the rather as there was one painted on the board. So his inscription was ultimately reduced to *John Thompson*, with the figure of a hat subjoined.'"

When the members were about to sign the document, Mr. Hancock is reported to have said, "We must be unanimous; there must be no pulling different ways; we must all hang together." "Yes," replied Franklin, "we must indeed all hang together, or most assuredly we shall all hang separately."

The Doric simplicity of his style; his incomparable facility of condensing a great principle into an apologue or an anecdote, many of which, as he applied them, have become the folk-lore of all nations; his habitual moderation of statement, his aver-

Literary style.

sion to exaggeration, his inflexible logic, and his perfect truthfulness,—made him one of the most persuasive men of his time, and his writings a model which no one can study without profit. A judicious selection from Franklin's writings should constitute a part of the curriculum of every college and high school that aspires to cultivate in its pupils a pure style and correct literary taste.

There was one incident in Franklin's life, which, though more frequently referred to in terms of reproach than any other, will probably count for more in his favor in the Great Assize than any other of his whole life. While yet in his teens he became a father before he was a husband. He never did what men of the loftiest moral pretensions not unfrequently do,—shirk as far as possible any personal responsibility for this indiscretion. On the contrary, he took the fruit of it to his home; gave him the best education the schools of the country then afforded. When he went abroad, this son accompanied him, was presented as his son wherever he went, was presented in all the great houses in which he himself was received; he entered him at the Inns of Court, and in due time had him admitted to the English bar; made him his private secretary, and at an early age caused him to be appointed by the Crown, Governor of New Jersey. The father not only did everything to repair the wrong he had done his son, but at a time when he was at the zenith of his fame and official importance, publicly proclaimed it as one of the great errors of his life. The world has always abounded with bastards; but with the exception of crowned heads claiming to hold their sceptres by Divine right, and therefore beyond the reach of popular criticism or reproach, it would be difficult to name another parent of his generation of anything like corresponding eminence with Franklin, who had the courage and magnanimity to expiate such a wrong to his offspring so fully and effectively.

Franklin was not a member of the visible Church, nor did he ever become the adherent of any sect. He was three years younger than Jonathan Edwards, and in his youth heard his share of the then prevailing theology of New England, of which Edwards was regarded, and perhaps justly, as the most eminent exponent. The extremes to which Edwards carried those doctrines at last so shocked the people of Massachusetts that he was rather ignominiously expelled from his pulpit at Northampton; and the people of Massachusetts, in very considerable proportions, gradually wandered over into the Unitarian communion. To Jonathan Edwards and the inflexible law of action and reaction, more than to Priestley or any one else of their generation, that sect owes to this day its numerical strength, its influence, and its dignity, in New England. With the creed of that sect Dr. Franklin had more in common than with any other, though he was much too wise a man to suppose that there was but one gate of admission to the Holy City. He believed in one God; that Jesus was the best man that ever lived, and his example the most profitable one ever given us to follow. He never succeeded in accepting the doctrine that Jehovah and Jesus were one person, or that miracles attributed to the latter in the Bible were ever worked. He thought the best service and sufficient worship of God was in doing all the good we can to his creatures. He therefore never occupied himself much with ecclesiastical ceremonies, sectarian differences, or theological subtleties. A reverend candidate for episcopal orders wrote to Franklin, complaining that the Archbishop of Canterbury had refused to ordain him unless he would take the oath of allegiance, which he was too patriotic a Yankee to do. Franklin, in reply, asked what necessity there was for his being connected with the Church of England; if it would not be as well were it the Church of Ireland. Perhaps were he to apply to the Bishop of Derry, who was a man of liberal sentiments, he might give him orders, as of that Church. Should both England and Ireland refuse, Franklin assumed that the Bishops of Sweden and Norway would refuse also, unless the candidates embraced Lutheranism. He then added:

Doctrine and creed.

"Next to becoming Presbyterians, the Episcopalian clergy of America, in my humble opinion, cannot do better than to follow the example of the first clergy of Scotland, soon after the conversion of that country to Christianity. When the King had built the cathedral of St. Andrew's, and requested the King of Northumberland to lend his bishops to ordain one for them, that their clergy might not as heretofore be obliged to go to Northumberland for orders, and their request was refused, they assembled in the cathedral, and the mitre, crosier, and robes of a bishop being laid upon the altar, they after earnest prayers for direction in their choice elected one of their own number; when the King said to him, "*Arise, go to the altar, and receive your office at the hand of God.*" His brethren led him to the altar, robed him, put the crosier in his hand and the mitre on his head, and he became the first Bishop of Scotland.

"If the British islands were sunk in the sea (and the surface of this globe has suffered great changes), you would probably take some such method as this; and if they persist in denying your ordination, it is the same thing. A hundred years hence, when people are more enlightened, it will be wondered at that men in America, qualified by their learning and piety to pray for and instruct their neighbors, should not be permitted to do it till they had made a voyage of six thousand miles out and home, to ask leave of a cross old gentleman at Canterbury."

Franklin, however, was in no sense an agnostic. What he could not understand he did not profess to understand or believe; neither was he guilty of the presumption of holding that what he could not understand, he might not have understood if he had been a wiser and better man. Though impatient of cant and hypocrisy, especially in the pulpit, he never spoke lightly of the Bible, or of the Church and its offices. When his daughter Sally was about to marry, he wrote to her:

"My dear child, the natural prudence and goodness of heart God has blest you with, make it less necessary for me to be particular in giving you advice. I shall therefore only say, that the more attentively dutiful and tender you are towards your good mamma, the more you will recommend yourself to me. But why should I mention *me*, when you have so much higher a promise in the Commandments, that such conduct will recommend you to the favor of God? You know I have many enemies, all indeed on the public account (for I cannot recollect that I have in a private capacity given just cause of offense to any one whatever); yet they are enemies, and very bitter ones; and you must expect their enmity will extend in some degree to you, so that your slightest indiscretions will be magnified into crimes, in order the more sensibly to wound and afflict me. It is therefore the more necessary for you to be extremely circumspect in all your behavior, that no advantage may be given to their malevolence.

Parental advice.

"Go constantly to church, whoever preaches. The act of devotion in the Common Prayer Book is your principal business there, and if properly attended to will do more towards amending the heart than sermons generally can do. For they were composed by men of much greater piety and wisdom than our common composers of sermons can pretend to be; and therefore I wish you would never miss the prayer days: yet I do not mean you should despise sermons, even of the preachers you dislike, for the discourse is often much better than the man, as sweet and clear waters come through very dirty earth. I am the more particular on this head, as you seemed to express a little before I came away some inclination to leave our church, which I would not have you do."

I cannot more fitly close this imperfect sketch of America's most illustrious citizen, than by quoting from a touching and most affectionate letter from Mrs. Hewson (Margaret Stevenson),—one of Franklin's worthiest, most faithful, and most valued friends,—addressed to one of Franklin's oldest friends in England.

"We have lost that valued, venerable, kind friend whose knowledge enlightened our minds and whose philanthropy warmed our hearts. But we have the consolation to think that if a life well spent in acts of universal benevolence to mankind, a grateful acknowledgment of Divine favor, a patient submission under severe chastisement, and an humble trust in Almighty mercy, can insure the happiness of a future state, our present loss is his gain. I was the faithful witness of the closing scene, which he sustained with that calm fortitude which characterized him through life. No repining, no peevish expression ever escaped him during a confinement of two years, in which, I believe, if every moment of ease could be added together, would not amount to two whole months. When the pain was not too violent to be amused, he employed himself with his books, his pen, or in conversation with his friends; and upon every occasion displayed the clearness of his intellect and the cheerfulness of his temper. Even when the intervals from pain were so short that his words were frequently interrupted, I have known him to hold a discourse in a sublime strain of piety. I say this to you because I know it will give you pleasure.

Powers of memory.

"I never shall forget one day that I passed with our friend last summer. I found him in bed in great agony; but when that agony abated a little I asked if I should read to him. He said yes; and the first book I met with was Johnson's *Lives of the Poets*. I read the *Life of Watts*, who was a favorite author with Dr. Franklin; and instead of lulling him to sleep, it roused him to a display of the powers of his memory and his reason. He repeated several of Watts's *Lyric Poems* and descanted upon their sublimity in a strain worthy of them and of their pious author. It is natural for us to wish that an attention to some ceremonies had accompanied that religion of the heart which I am convinced Dr. Franklin always possessed; but let us who feel the benefit of them continue to practice them, without thinking lightly of that piety which could support pain without a murmur, and meet death without terror."

Franklin made a somewhat more definite statement of his views on the subject of religion, in reply to an inquiry from President Stiles of Yale College, who expressed a desire to know his opinion of Jesus of Nazareth. Franklin's reply was written the last year of his life, and in the eighty-fourth of his age:

"You desire to know something of my religion. It is the first time I have been questioned upon it. But I cannot take your curiosity amiss, and shall endeavor in a few words to gratify it. Here is my creed. I believe in one God, the creator of the universe. That he governs it by his Providence. That he ought to be worshipped. That the most acceptable service we render to him is doing good to his other children. That the soul of man is immortal, and will be treated with justice in another life respecting its conduct in this. These I take to be the fundamental points in all sound religion, and I regard them as you do in whatever sect I meet with them.

"As to Jesus of Nazareth, my opinion of whom you particularly desire, I think his system of morals and his religion, as he left them to us, the best the world ever saw or is like to see; but I apprehend it has received various corrupting changes, and I have, with most of the present Dissenters in England, some doubts as to his Divinity; though it is a question I do not dogmatize upon, having never studied it, and think it needless to busy myself with it now, when I expect soon an opportunity of knowing the truth with less trouble. I see no harm, however, in its being believed, if that belief has the good consequence, as probably it has, of making his doctrines more respected and more observed; especially as I do not perceive that the Supreme takes it amiss, by distinguishing the unbelievers in his government of the world with any peculiar marks of his displeasure.

Religious beliefs.

"I shall only add, respecting myself, that, having experienced the goodness of that Being in conducting me prosperously through a long life, I have no doubt of its continuance in the next though without the smallest conceit of meriting such goodness. My sentiments on this head you will see in the copy of an old letter inclosed, which I wrote in answer to one from an old religionist whom I had relieved in a paralytic case by electricity, and who, being afraid I should grow proud upon it, sent me his serious though rather impertinent caution."

JOHN BIGELOW.

FRANKLIN, SIR JOHN (1786–1847), rear-admiral, was born at Spilsby, Lincolnshire, April 16, 1786. Sprung from a line of free-holders, or "franklins," his father inherited a small family estate, which was so deeply mortgaged by his immediate predecessor that it was found necessary to sell it; but by his success in commercial pursuits he was enabled to maintain and educate a family of twelve children. John, the youngest son, was destined for the church by his father, who, with this view, had purchased an advowson for him. He received the rudiments of education at St. Ives, and afterwards attended Louth Grammar School for two years; but having employed a holiday in walking 12 miles with a companion to look at the sea, which up to that time he knew only by description, his imagination was so impressed that he determined to be a sailor. In the hope of dispelling what he considered to be a boyish fancy, his father sent him on a trial voyage to Lisbon in a merchantman; but it being found on his return that his wishes were unchanged, an entry on the quarter-deck of the "Polyphemus," 74, Captain Lawford, was procured for him in 1800; and this ship having led the line in the battle of Copenhagen in 1801, young Franklin had the honor of serving in Nelson's hardest-fought action. Two months after the action of Copenhagen, he joined the "Investigator," discovery-ship, commanded by his relative Captain Flinders, and under the training of that able scientific officer, while employed in exploring and mapping the coasts of Australia, he acquired a correctness of astronomical observation and a skill in surveying which proved of eminent utility in his future career. Franklin was on board the "Porpoise" when that ship and the "Cato" were wrecked, August 18, 1803, on a coral reef, off the coast of Australia (see FLINDERS). After this misfortune, Franklin proceeded to Canton, where he obtained a passage to England in the "Earl Camden," East Indiaman, commanded by Sir Nathaniel Dance, commodore of the China fleet of 16 sail. On the 15th of February, 1804, Captain Dance repulsed a strong French squadron, led by the redoubtable Admiral Linois. In this action Franklin performed the important duty of signal midshipman. On reaching England, he joined the "Bellerophon," 74, and in that ship he was again entrusted with the signals, a duty which he executed with his accustomed coolness and intrepidity in the great battle of Trafalgar. In the "Bedford," his next ship, he attained the rank of lieutenant, and remaining in her for six years, latterly as first lieutenant, served in the blockade of Flushing, on the coast of Portugal, and in other parts of the world, but chiefly on the Brazil station, whither the "Bedford" went as part of the convoy which escorted the royal family of Portugal to Rio de Janeiro in 1808. In the ill-managed and disastrous attack on New Orleans, he commanded the "Bedford's" boats in an engagement with the enemy's gunboats, one of which he boarded and captured, receiving a slight wound in the hand-to-hand fight.

On peace being established, Franklin turned his attention once more to the scientific branch of his profession, and sedulously extended his knowledge of surveying. In 1818 the discovery of a north-west passage became again, after a long interval, a national object, and Lieutenant Franklin was appointed to the "Trent," as second to Captain Buchan of the "Dorothea," hired vessels equipped for penetrating to the north of Spitzbergen, and, if possible, crossing the Polar Sea by that route. During a heavy storm, both ships were forced to seek for safety by boring into the closely packed ice, in which extremely hazardous operation the "Dorothea" was so much damaged that her reaching England became doubtful; but the "Trent" having sustained less injury, Franklin requested to be allowed to prosecute the voyage alone, or under Captain Buchan, who had the power of embarking in the "Trent" if he chose. The latter, however, declined to leave his officers and men at a time when the ship was almost in a sinking condition, and directed Franklin to convoy him to England. Though success did not attend this voyage, it brought Franklin into personal intercourse with the leading scientific men of London, and they were not slow in ascertaining his peculiar fitness for the command of such an enterprise. To calmness in danger, promptness and fertility of resource, and excellent seamanship, he added other qualities less common, more especially an ardent desire to promote science for its own sake, and not merely for the distinction which eminence in it confers, together with a love of truth that led him to do full justice to the merits of his subordinate officers, without wishing to claim their discoveries as a captain's right. Added to this, he had a cheerful buoyancy of mind, which, sustained by religious principle of a depth known only to his most intimate friends, was not depressed in the most gloomy times. It was, therefore, with full confidence in his ability and exertions that he was, in 1819, placed in command of an expedition appointed to travel through Rupert's Land to the shores of the Arctic Sea, while Lieutenant Parry was despatched with two vessels to Lancaster Sound. At this period, the northern coast of America was known at two isolated points only, viz., the mouth of the Coppermine River, discovered by Hearne,—but placed erroneously by him four degrees of latitude too much to the north,—and the mouth of the Mackenzie. Lieutenant Franklin, accompanied by a surgeon, two midshipmen, and a few Orkneymen, embarked for Hudson's Bay, in June, 1819. His instructions left the route he was to pursue much to his own judgment, guided by the information he might be able to collect at York Factory from the Hudson's Bay Company's servants there assembled. Wintering the first year on the Saskatchewan, the expedition was fed by the Hudson's Bay Company; the second winter was spent on the "barren grounds," the party subsisting on game and fish procured by their own exertions, or purchased from their native neighbors; and in the following summer the expedition descended the Coppermine River, and surveyed a considerable extent of the sea coast to the eastward. The survivors of this expedition travelled, from their start at York Factory to their return to it again, by land and water, 5550 miles. While engaged on this service, Franklin was promoted to be a commander, and after his return to England in 1822 he obtained the post rank of captain, and was elected a fellow of the Royal Society. In the succeeding year he married Eleanor, the youngest daughter of Mr. Porden, an eminent architect.

In a second expedition, which left home in 1825 (his wife dying within the same year), Franklin descended the Mackenzie and traced the coast-line through 37 degrees of longitude, from the mouth of the Coppermine River, where his former survey commenced, to near the 150th meridian, and approaching within 160 miles of the most easterly point attained by Captain Beechey, who was co-operating with him from Behring's Strait. His exertions were fully appreciated at home and abroad. He was knighted in 1829, received the honorary degree of D.C.L. from the university of Oxford, was awarded the gold medal of the Geographical Society of Paris, and was elected in 1846 correspondent of the Paris Academy of Sciences. Though the surveys executed by himself and by a detachment under command of Dr. Richardson comprised one, and within a few miles of two, of the spaces for which a parliamentary reward was offered, the Board of Longitude declined making the award but a bill was soon afterwards laid before parliament by the secretary of the Admiralty abrogating the reward altogether, on the ground of the discoveries contemplated having been thus effected. The results of these expeditions are described by Franklin and his companion Dr. (afterwards Sir John) Richardson in two magnificent works published in 1824–29. In 1828 he married his second wife, Jane, second daughter of Mr. John Griffin. His next official employment was on the Mediterranean station, in command of

the "Rainbow," and his ship soon became proverbial in the squadron for the happiness and comfort of her officers and crew.[1] As an acknowledgment of the essential service he had rendered off Patras in the "war of liberation," he received the Cross of the Redeemer of Greece from King Otho, and after his return to England he was created Knight Commander of the Guelphic order of Hanover.

In 1836 Sir John accepted the lieutenant-governorship of Van Diemen's Land (now Tasmania). His government, which lasted till the end of 1843, was marked by several events of much interest. One of his most popular measures was the opening of the doors of the legislative council to the public. He also originated a college, endowing it largely from his private funds with money and lands, in the hope that it would eventually prove the means of affording to all parties secular and religious instruction of the highest kind. He requested Dr. Arnold to select some one competent to take the direction of this institution; and the choice fell on the Rev. John Philip Gell. In his time also the colony of Victoria was founded by settlers from Tasmania; and towards its close, transportation to New South Wales having been abolished, the convicts from every part of the British empire were sent to Tasmania. On an increase to the lieutenant-governor's salary being voted by the colonial legislature, Sir John declined to derive any advantage from it personally, while he secured the augmentation to his successors. In 1838 he founded a scientific society at Hobart Town (now called the "Royal Society of Tasmania"), the meetings of which were held in Government House, and its papers printed at his expense. He welcomed eagerly the various expeditions for exploration and surveying which visited Hobart Town under command of Captains Wickham, Stokes, Owen Stanley, and others. Conspicuous among these, and of especial interest to himself, were the French and English Antarctic expeditions of Dumont D'Urville and Sir James C. Ross,—the latter commanding the "Erebus" and "Terror," with which the name of Franklin was to be for ever so pathetically connected. A magnetic observatory, fixed at Hobart Town as a dependency of the central establishment under Colonel Sabine, was an object of deep interest up to the moment of his leaving the colony.

Thus pleasantly occupied, the years allotted to a colonial governorship drew to a close. Franklin had passed through phases of difficulty common to all governors of colonies remote from the imperial centre; and it was impossible for an impartial and high-minded ruler to avoid collision with personal interests. But that his unflinching efforts for the social as well as the political advancement of the colony were already appreciated was abundantly proved by the affection and respect universally testified by the addresses which proceeded from every section of the community, and by the demonstrations from all classes on his departure. A local newspaper, describing the scene in much detail, adds, "Thus departed from among us as true and upright a governor as ever the destinies of a British colony were entrusted to." That this was no evanescent feeling is attested by the fact that several years afterwards the colonists showed their remembrance of his virtues and services by sending to Lady Franklin a subscription of £1700 in aid of her efforts in the search for their former governor, and later still by a unanimous vote of the legislature for the erection of a statue in honor of him at Hobart Town.

Sir John found, on reaching England, that the confidence of the Admiralty in him was undiminished, as was shown by his being offered in 1845 the command of an expedition for the discovery of the North-West passage; this offer he accepted. The prestige of Arctic service and of his former experiences attracted a crowd of volunteers of all classes, from whom were selected a body of officers conspicuous for talent and energy. Thus supported, with crews carefully chosen (some of whom had been engaged in the whaling service), victualled for three years, and furnished with every appliance then known, Franklin's expedition, consisting of the "Erebus" and "Terror" (134 officers and men), with a transport ship to convey additional stores as far as Disco in Greenland, sailed from Greenhithe on the 19th of May, 1845. The ships were last seen on the 26th of July in Baffin's Bay by a whaler which was moored to an iceberg in lat. 74° 48′ N. and long. 66° 13′ W.; and at that time the expedition was proceeding prosperously. Letters written by Franklin a few days previous to that date were couched in language of cheerful anticipation of success, while those received from his officers expressed their glowing hope, their admiration of the seaman-like qualities of their commander, and the happiness they had in serving under him.

Franklin's instructions were framed (in conjunction with Sir John Barrow and upon his own suggestions) by the eminent explorers with whom his former work had closely connected him. The experience of Parry made it evident that a fresh attempt to force ships through the heavy ice seen by him to the south-west of Melville Island would be futile, as has since been fully proved. On the other hand, Franklin's surveys of the north coast of America had long before satisfied him that a navigable passage existed along it, from the Fish River to Behring's Strait. He was therefore directed to pursue a course towards the coast after he had approached the longitude of about 98° W., and was allowed the single alternative of previously examining Wellington Channel if the navigation were open. An explicit prohibition was given against a westerly course beyond the longitude of 98° W.

In 1847, though there was no real public anxiety as to the fate of the expedition, preparations began to be made for the possible necessity of succoring the explorers. As time passed, however, and no tidings of the expedition reached England, the search began in earnest; expedition after expedition was despatched in quest of them in 1848 and succeeding years, regardless of cost or hazard. In this great national undertaking Sir John's heroic wife took a part which will ennoble her name for all time. Between 1848 and 1854 about fifteen expeditions were sent out by England and America in the hope of rescuing, or at least finding traces of the missing explorers. The details of the work done by those expeditions will be given in the article on POLAR REGIONS; here we shall confine ourselves to the results, so far as the search for Franklin was concerned. Lady Franklin's exertions were unwearied; she exhausted her private funds in sending out auxiliary vessels to quarters not comprised in the public search, and by her pathetic appeals she roused the sympathy of the whole civilized world. Traces of the missing ships were discovered by Ommanney and Penney in August, 1850, and were brought home by the "Prince Albert," fitted out by Lady Franklin with the especial object of following to the southward the route which would be almost certainly taken by Franklin in carrying out his instructions. It was thus ascertained that the first winter had been spent behind Beechey Island, where they had remained at least as late as April, 1846. No further tidings were obtained until the spring of 1854, when Dr. Rae, then conducting an exploring party of the Hudson's Bay Company from Repulse Bay, was told by the Eskimo that (as was inferred) in 1850 white men, to the number of about forty, had been seen dragging a boat over the ice near the north shore of King William's Island, and that later in the same season, but before the breaking up of the ice, the bodies of the whole party were found by the natives at a point a short distance to the north-west of Back's Great Fish River, where they had perished from the united effects of cold and famine. The latter statement was afterwards disproved by the discovery of skeletons upon the presumed line of route; but indisputable proof was given that the Eskimo had communicated with members of the missing expedition, by the various articles obtained from them and brought home by Dr. Rae, who, on his return to England, claimed, and succeeded in obtaining, the reward of £10,000 offered by the Admiralty in 1849, "to any party or parties who, in the judgment of the Board of Admiralty, shall, by virtue of his or her efforts, first succeed in ascertaining" the fate of the missing expedition. On account of the information obtained by Dr. Rae, a party in two canoes under Messrs. Anderson and Stewart was in 1855 sent by Government down the Great Fish River, and they succeeded in obtaining from the Eskimo at the mouth of the river a considerable number of articles which had evidently belonged to the Franklin expedition; and many others were picked up on Montreal Island, articles evidently belonging to a boat which, it was reported, had been cut up by the Eskimo. This expedition was unable to make so thorough a search as was desirable, but it was clear from the results obtained by it, and from the examinations which had been made by the many other expeditions of all straits and inlets and

[1] The sailors, with their usual fondness for epithets, named the ship the "Celestial Rainbow" and "Franklin's Paradise."

coasts except the region to the north of Great Fish River, that King William's Island, the west coast of Boothia, and the neighboring sea were the fields likely to yield the most satisfactory results. It was clear that a party from the "Erebus" and "Terror" had endeavored to reach by the Fish River route the settlements of the Hudson Bay Company, and equally evident that the expedition, in making a southerly course, had been arrested within the channel into which the Great Fish River empties itself. At this time Government was wholly taken up with the events in the East, and when the war was over it was deemed useless to spend any more money and risk any more lives in what was regarded as a hopeless quest. But Lady Franklin's pious devotion to the memory of her noble husband prompted her to make one last effort to ascertain his fate; to this object she dedicated all her available means, aided, as she had been before, by the subscriptions of sympathizing friends, her judgment being confirmed by the opinion of all those best able to form one as to the hopefulness as well as the feasibility of such an attempt. Accordingly she purchased and fitted out the little yacht "Fox," which sailed from Aberdeen in July, 1857; the command was accepted by Captain (afterwards Sir) Leopold M'Clintock, whose high reputation had been won in three of the Government expeditions sent out in search of Franklin. Having been compelled to pass the first winter in Baffin's Bay, it was not till the autumn of 1858 that the expedition passed down Prince Regent's Inlet, and the "Fox" put into winter quarters at Port Kennedy, at the eastern end of Bellot Strait, between North Somerset and Boothia Felix. In the spring of 1859 three sledging parties went out, Captain (now Sir) Allen Young to examine Prince of Wales Island, Lieutenant (now Captain) Hobson the north and west coasts of King William's Island, and M'Clintock the east and south coasts of the latter, the west coast of Boothia, and the region about the mouth of Great Fish River. The search was successful so far as ascertaining the course and fate of the expedition is concerned. From the Eskimo in Boothia many relics were obtained, and reports as to the fate of the ships and men; all along the west and south coast of King William's Island remains of articles belonging to the ships were discovered, and skeletons that told a terrible tale of disaster. Above all, in a cairn at Point Victory a precious record was discovered by Lieut. Hobson that briefly told the history of the expedition up to April 25, 1848, three years after it set out full of hope. In 1845–6 the "Erebus" and "Terror" wintered at Beechey Island, on the S.W. coast of North Devon, in lat. 74° 43′ 28″ N., long. 91° 39′ 15″ W., after having ascended Wellington Channel to lat. 77° and returned by the west side of Cornwallis Island. This statement was signed by Graham Gore, lieutenant, and Charles F. Des Vœux, mate, and bore date May 28, 1847. These two officers and six men, it was further told, left the ships on May 24, 1847, no doubt for an exploring journey, at which time all was well,

The success of the first year's work, thus briefly stated, was greater than has been since attained within any one season in arctic service. The alternative course permitted by Franklin's instructions had been attempted but was not pursued, and in the autumn of 1846 he followed that which was especially commended to him. But on his attempting to reach the coast of America, the obstruction of heavy ice, which presses down from Melville Island through M'Clintock Channel (not then known to exist) upon King William's Island had finally arrested his progress. It must be remembered that in the chart carried out by Franklin this island was laid down as a part of the mainland of Boothia, and he therefore could pursue his way *only* down its western coast. The record that revealed all which has been briefly stated was written upon one of the forms supplied by the Admiralty to surveying vessels, to be thrown overboard after the required data had been filled in. But upon the margin around the printed form was an addendum dated the 25th April, 1848, which extinguished all hopes of a successful termination of their grand enterprise. The facts are best conveyed by the terse and expressive words of the record, which is therefore given *verbatim*:—"April 25th, 1848. H. M. Ships 'Terror' and 'Erebus' were deserted on 22d April, five leagues N.N.W. of this, having been beset since 12th September, 1846. The officers and crews, consisting of 105 souls under the command of Captain F. R. M. Crozier, landed here in lat. 69° 37′ 42″ N., long. 98° 41′ W. Sir John Franklin died on the 11th June, 1847; and the total loss by deaths in the expedition has been to this date 9 officers and 15 men." The handwriting is that of Captain Fitzjames, to whose signature is appended that of Captain Crozier, who also adds the words of chief importance, namely, that they would "start on tomorrow 26th April, 1848, for Back's Fish River." A briefer record has never been told of so tragic a story. Thus it was reserved for the latest effort of Lady Franklin to develop not only the fate of her husband's expedition, but also the steps of its progress up to crowning success, mingled indeed with disaster almost unprecedented.

All of the party had without doubt been greatly reduced through want of sufficient food, and the injurious effects of three winters in these regions. They had greatly overrated their strength in attempting to drag with them two boats, besides heavily laden sledges, and doubtless had soon been compelled to abandon much of their burden, and leave one boat on the shore of King William's Island, where it was found, near the middle of the west coast, by M'Clintock; it contained two skeletons. From the Eskimo we learn that the men dropped down as they walked, and often had to be left unburied. Although many relics were found in possession of the Eskimo, there seems no reason to believe that the retreating crews met with foul play. From all that can be gathered, one of the vessels must have been crushed in the ice and the other stranded on the shore of King William's Island, where it lay for years, forming a mint of wealth for the neighboring Eskimo. M'Clintock examined all the shores of the island with the greatest care, but found no trace of a stranded vessel.

This is all we know of the fate of Franklin and his brave men. His memory is cherished as one of the most conspicuous of the naval heroes of Britain, and as one of the most successful and daring of her explorers. He is certainly entitled to the honor of being the first discoverer of the North-West passage; the point reached by the ships brought him to within a few miles of that attained from the westward by the explorations of earlier years; he had indeed all but traversed the entire distance between Baffin's Bay and Behring's Strait. On the monument erected to Franklin by his country, in Waterloo Place, London, the honor of discovering the passage is justly awarded to him and his companions,—a fact which was also affirmed by the president of the Royal Geographical Society, when presenting to Lady Franklin in 1860 their gold medal. More recently a fine monument, erected in 1875 in Westminster Abbey, commemorates the heroic deeds and fate of Sir John Franklin, the death (which occurred in that year) of Lady Franklin, and the inseparable connection of her name with the fame of her husband. Most of the Franklin relics brought home by M'Clintock were presented by Lady Franklin to the United Service Museum, while those given by Dr. Rae to the Admiralty are deposited in Greenwich Hospital. Captain Hall, so well known in connection with the "Polaris" expedition, spent five years with the Eskimo, and made two journeys in endeavoring to trace the remnant of Franklin's party, bringing back in 1869 a number of additional relics and some information confirmatory of that given by M'Clintock. In 1878 a search expedition was sent out from America in consequence of a tale told to Mr. Barry, the mate of a whaler, by some Nechelli Eskimo, met by him at Whale Point, Hudson's Bay. He obtained from these Eskimo some spoons bearing Franklin's crest. The Eskimo were understood to say that these were received from a party of white men, who passed a winter near their settlement, and all died. The white men, the Eskimo stated, left a number of books with writing in them, which were buried. The story has some points about it that make one inclined to doubt its accuracy. Still it is satisfactory that the search party has been sent out, and we can only hope that it will be rewarded by discovering some of the records of the unfortunate expedition.[1] (J. S. K.)

FRANKS, The. When, in the year 241 A.D., the soldiers of Aurelian, who just before had been on the north German frontier, marched out of Rome on their way to the Persian war, they sang (Vopiscus *in Aureliano*, c. 7) a rough barrack song—

> "Mille Sarmatas, mille *Francos*, semel et semel occidimus;
> Mille mille mille mille mille Persas quærimus;"

[1] The first portion of this notice is mainly from Sir John Richardson's article in last edition, and the whole has been revised by Miss Cracroft, Sir John Franklin's niece.

and the words, caught up by the admiring mob, became a street boys' ballad in those days of debased imperialism. Unless we give to Peutinger's *Itinerary* an earlier date than is probable, this street song marks the first appearance in history of the Frankish name. Cæsar, Tacitus, Ptolemy, are alike silent as to it, although they often speak of other tribes which occupied the very districts in which we afterwards find the Franks. It is therefore probable, though Jacob Grimm (*Geschichte der Deutschen Sprache*, p. 518) says that the view has "only a moderate value," that Frank is the newest of all German names, and represents, somewhat vaguely, a group of tribes who dwelt about the lower and middle Rhine. The Frank lived in districts previously occupied by tribes bearing other names; nor have we proof of any incursion of a strange tribe called Franks from north or east. The old Frankish legend that they came from the Danube to the Rhine probably arose from the fact that a colony of the Sicambrian cohort was planted by the Romans on the spot where Buda-Pesth now stands; nor need we seriously consider the usual annalist statement that they were "reliquiæ Troianorum." The meaning and origin of the term also lends itself to the view above stated,—the words "frank and free," usually grouped together, are in fact the same in origin and meaning (*fri, frech*, M.H.G.; *frekkar*, Scand.; *friks*, Goth. = *audax, avidus;* then by insertion of *n*, cp. *linquo* from

The Salians and Ripuarians, *cir.* 400.

root of *liqui*, we get *frank*). The two words thus grouped together form an epithet rather than a proper name; the "frec Franks" are those tribes whose freedom suffered most attack; the name probably came into being in the 3d century A.D. as a part of the resistance of northern and north-western Germany to the ceaseless attempts of Rome. "Franens habet nomen a feritate sua," says Ermoldus Nigellus (i. 344); and the word carries the sense of boldness, defiance, freedom. As it did not lend itself well to Latin verse-endings, and as its origin was late, we find the silver and leaden poets delighting to call the Franks Sicambri, as in the famous speech of St. Remi to Hlodowig, "Depone mitis colla, Sicamber," etc.

When their history begins, the Franks are in three groups, mostly on the left bank of the Rhine, from Mainz to the sea. It is, however, quite clear that in earlier days they dwelt also on the right or German bank; for if at first the Romans pressed on them, ere long they began to press on the Romans in return. The oldest Frankish land was then on the Rhine; some of it lay to the north of the Betuwe (the island between Meuse and Rhine), having the river Yssel as its eastern limit, and a line drawn through Dorstede, Utrecht, and Muyden as its western boundary. The Franks of this district, afterwards called Salians (a name derived either from Sala, an inheritance, or from the river Saal, or Yssel), filled the parts called the Veluwe and the territory of the Sicambri; south-east of these was a second group, the Chamavi, Bructeri, Attuarii, also at first on the right bank of the Rhine; beyond these, a group of Chatti and Suevi, from a little above Cologne to the Main, filling up all the country between the Taunus hills and the Rhine. It is to this group of tribes, says Watterich (*Germanen des Rheins*, p. 166), that the title Frank was first given. This view of their geographical distribution is supported by the evidence of Peutinger's *Itinerary*, in which Francia stands on the right bank of the Rhine from just above Nimwegen to a little below Coblentz; and though this famous map is a road-chart rather than a record of ethnology and tribal distribution, still it may fairly be urged that its author would not have placed the Franks on the very outside of his map had their home been on the left bank of the Rhine.

In the middle of the 3d century these Franks began to press into the First and Second Germany, two tracts of land on the left bank of the Rhine from Alsace to the sea. In 240 the Chatti crossed at Mainz; in 258 Franks are in the army of Postumus as well as opposed to him; with them he drove their brethren across the Rhine and made Cologne his capital. By degrees they filled the whole district from the Moselle to the Betuwe, occupying the lands of the Ubii and Tungri, that is, from the Ardennes to the Rhine and Meuse. These Franks are known to history as the Ripuarians, receiving, as was not unnatural, a partly Latin name (Ripuarii, Riparii, bank-men; or possibly Rip-wehr-ii, bank-defenders). About the same time the Salian Franks also moved southward, crossing the Rhine, which in those days was slow and shallow in its lower course, the main waters having been diverted into the Meuse. They occupied the whole Betuwe, and spread down to the sea, inhabiting the marshy delta of the rivers ("paludicolæ Sigambri," or "Franci inviis strati paludibus," *circa* 280 A.D.); and presently (287) they took part in naval expeditions down the coast of Gaul. Then, passing the Meuse also, they seized on Toxandria, which was given over to them in 358 by the emperor Julian, who defeated them, and admired their bravery and independent spirit. Henceforth we find plenty of Franks taking service under the empire: Frankish chiefs, like Bald, Mellobald, Arbogast, rise to high places in court and army; their names appear even in the Consular Fasti; they make or unmake emperors. By the end of the 4th century the frontiers of the empire to the north had permanently receded: Andernach was the outmost Rhine station held by the Romans; Tournay was still theirs; they had a fleet on the Sambre; all beyond was Frankish land. Before long the Franks advanced again: in 429 we hear (in Gregory of Tours) that the Salians, coming "from Dispargum (Disiburg, the city of the goddesses), in Toringia," won a great battle at Cambrai under Chlodion their king, and penetrated even as far as the Loire. This Toringia is probably a confusion with Tongria, a little district on the Meuse; the Franks were never in Thuringia. With their two capitals, the Salians at Dispargum, the Ripuarians at Cologne, the Franks now became the bulwark of the Romans: they resisted the barbarians who crossed the Rhine at Mainz in 406; and in 451 again joined the legions to repel at Chalons the hideous invasion of Attila. Thus feeling their strength, it was not long before, under their young king Hlodowig, or Clovis, the Salian Franks became masters of northern Gaul, while their brethren the Ripuarians remained for the time near the Rhine. And "as the son of Childerich, following in the steps of his kinsfolk, pressed southwards, in mid career of victory he met the Christians' God. The Disi, the wild goddesses, abandoned him; he trusted in the god of Hlotehild, and conquered all his foes" (Watterich *Die Germanen des Rheins*, p. 238). These Christianized Salians, under the Merwing house, became in time lords of all Gaul, and gave it a new name, Francia Occidentalis, or Interior, or Latina, to distinguish it from the older Francia Orientalis, the Germany of the middle Rhine; the latter name drifted off towards the east, and has found a home in that central district of Franconia, which lies far away from the true Frankish land.

Henceforth the history of the Franks falls under that of France; while their institutions were mainly those of all Germans. (See FRANCE and GERMANY). Their physical features were also those of the race in general; the fierceness of their looks; the wrinkled scowl about their brows, "torvi Sicambri;" their wild blue eyes; their large limbs, which contrasted with the little stature of the Romans; their long fair hair, which was a choice commodity at Rome, being bought eagerly by the ladies of fashion in those late imperialist days,—all these things had little in them that was specially Frankish. Their weapons were more characteristic, being their own and connected closely with their name. They fought either with the "framea" (a word which is almost certainly a copyist's error for "franca"), which was a light javelin, tipped with iron sharpened on either side, a weapon fit for casting or smiting, and sometimes spoken of as a little axe; or with the francisca, which was a heavy battle-axe. It is to the Franks that the great Siegfried Saga properly belongs; and their early history is hopelessly mixed up with legend. It is not till the days of Hlodowig that any light is thrown on their institutions,—the *Lex Salica*, the law of the Salian Franks, and the *Lex Ripuaria*, of which the origin was a little later, belonging probably to the end of the 5th and the early part of the 6th centuries. The *Lex Salica* was afterwards enlarged and altered; in its earliest form it presents to us the Franks in their Toxandrian or Tongrian time, before Christianity had touched them. This law shows no trace of a feudal nobility or a "feudal system" of any kind; as Waitz (*Deutsche Verfassungsgeschichte: Das alte Recht der Salischen Franken*, p. 103) says, "Das Salische Gesetz kennt keinen Adel; auch nicht die leiseste Spur desselben findet sich." The tribes had chiefs or kings, elected by the whole body of free men from one family (as Hlodowig from among the Merwings); there were also sundry officers of justice and administration, rachimburgs or grafs, but these are no more noble than the rest of the free Franks, who formed a republic of fighting men, each man's voice being as potent in the mall as his arm was in the battle. The "læti," or the "pueri regis," the king's "damsels," and the antrustions belong to the later editions of the law. King, free Frank, and slave of war,—these are the only grades. The code endeavors, always by imposition of carefully graduated fines, to protect the sanctity of the Frank's family, to determine his duties towards the king, the graf, and the tribal council or mall, to provide for the security of his property, whether personal or landed. It is in this last part of the code that we find the famous clause (*Lex Salica*, lix., De Alodis, § 5; Waitz, p. 266) on which the so-called Salic law of France was afterwards based: "De terra vero nulla in muliere hereditas est, sed ad virilem sexum qui fratres fuerint tota terra perteneat." This special limitation as to the inheriting of Salic land (the Stamm-land as the Germans call it, the Odal of the Icelanders) is but a scanty basis on which to build a great law of royal succession, which lasted in France as long as the monarchy continued, and might still reappear, were the present republic to prove untrue to itself. Up to the time of the Revolution, the French noblesse prided themselves on being the "proud descendants of the conquerors;" but though it is possible, in earlier times, to trace or to fancy distinctions of feature and character, marking off the noble from the *roturier* or the peasant, still in the later days of the monarchy "the noble race of conquerors" was so much changed, so many old houses had become extinct, so many had been diluted with foreign blood, so many new patents of nobility had been issued, that it would require no small ingenuity and imagination to see in the courtiers of Louis XVI. the representatives of the Franks of Hlodowig or Charles the Great.

The chief authorities for the Franks are Jakob Grimm, *Geschichte der deutschen Sprache*, Leip., 1848; Waitz, *Das alte Recht der Salischen Franken: Beilage zur deutschen Verfassungsgeschichte*, Kiel, 1846; Gohm, *Fränkische Reichs- und Gerichts-Verfassung*, Weimar, 1871; Watterich, *Die Germanen des Rheins*, Leip., 1872. There is also an ingenious lecture by Giesebrecht. In modern days not much has been written on the Franks, except in connection with the history of institutions. (G. W. K.)

FRANZÉN, FRANS MICHAEL (1772–1847), Swedish poet, was born at Ulcåborg in Finland, 9th February, 1772. At thirteen he entered the university of Åbo, where he graduated in 1789, and became "eloquentiæ docens" in 1792. Three years later he started on a tour through Denmark, Germany, France, and England, returning in 1796 to accept the office of university librarian at Åbo. In 1801 he became professor of history and ethics, and in 1808 was elected a member of the Swedish Academy. On the cession of Finland to Russia Franzén removed to Sweden, where he was successively appointed parish priest of Kumla in the diocese of Strengnäs (1810), minister of the Clara Church in Stockholm (1824), and bishop of Hernösand (1831). He died at Säbrå parsonage, 14th August, 1847. From the autumn of 1793, when his *Till en ung Flicka* and *Menniskans anlete* were inserted by Kellgren in the *Stockholmspost*, Franzén grew in popular favor by means of many minor poems of singular simplicity and truth, as *Till Selma*, *Den gamle knekten*, *Riddar St. Göran*, *De Små*, *Blommorna*, *Modren vid vaggan*, *Nyårsmorgonen*, and *Stjernhimmelen*. His songs *Goda gosse glaset töm*, *Sörj ei den gryende dagen förut*, *Champagnevinet*, and *Bevaringssång* were widely sung, and in 1797 he won the prize of the Swedish Academy by his *Sång öfver grefve Filip Creutz*. This noble lyric is the turning-point of Franzén's poetic life. Henceforth his muse, touched with the academic spirit, grew more reflective and didactic. His longer works, as *Emili eller en afton i Lappland*, and the epics *Sven Sture eller mötet vid Alvastra*, *Kolumbus eller Amerikas upptäckt*, and *Gustaf Adolf i Tyskland* (the last two incomplete), though rich in beauties of detail, are far inferior to his shorter pieces. Franzén was a true lyric poet, fixing with masterly art the fleeting traits of common life in a glorified and fascinating form. At a time when revolution shrieked against every traditional bond of society, the lyre of Franzén breathed innocence and peace. With gentle earnestness and naïveté he sang the sweetness of love and family life—his highest human type the prattling child, the flowery meadows his elysium. His innocence is his peculiar charm; "his very *espièglerie*," says Malmström, "is but the laugh of children's lips."

The poetical works of Franzén are collected under the title *Skaldestycken* (7 vols., 1824–61; new ed., *Samlade dikter*, with a biography by A. A. Grafström, 1867–69). A selection is published in 2 vols. (1871). His prose writings, *Om svenska drottningar* (1823), *Skrifter i obunden stil* (vol. i., 1835), *Predikningar* (5 vols., 1841–45), and *Minnesteckningar*, prepared for the Academy (3 vols., 1848–60), are marked by faithful portraiture and purity of style. See Malmström, *Inträdestal i Svenska Akademien* (1850); Hollander, *Minne af F. M. Franzén* (1868); Cygnæus, *Teckningar ur F. M. Franzéns lefnad* (1872); and Gustaf Ljunggren, *Svenska vitterhetens häfder efter Gustaf III.'s död*, vol. ii. (1876).

FRANZENSBAD, KAISER-FRANZENSBAD, EGERBRUNNEN, and formerly SCHLADAER SÄURLING a well-known Bohemian watering-place which owes its most popular name to the emperor Francis II. It is a little over three miles N. W. of Eger, at the height of about 1500 feet above the sea, in the neighborhood of the Fichtelgebirge, the Böhmerwald, and the Erzgebirge. There are altogether eight mineral springs, of which the first known was the Franzensquelle or Francis's fountain. The Poltersbrunnen gives off carbonic acid gas, which is utilized for medical purposes in a building erected in 1826. Besides the great *cursaal* or pump-room, the village contains several bathing establishments, one of which belongs to the town of Eger. In the park, which is also the property of the Eger municipality, there is a bronze statue of Francis I. by Schwanthaler. The mineral waters are saline and alkaline, and act as mild aperients and tonics. They have a great reputation, and have given rise to a considerable literature. See the works of Cartellieri (1869), Hamburger (1873), and Klein (1874). Population (1900), 2,330.

FRASCATI, a town of Italy, in the province of Rome and about 10½ miles south of the city, with a station at the terminus of a branch railway from the main line between Rome and Naples. It is the seat of a bishop, and a favorite summer residence of the Roman nobility. Among the public buildings are the old cathedral of S. Rocco, dating from the beginning of the 14th century; the new cathedral of San Pietro, founded about 1700 by Innocent XII.; the church of Santa Maria, of the 9th century; and seven old conventual establishments. But the interest of the place is due rather to its palatial villas. The villa Aldobrandini takes its name from Cardinal Pietro Aldobrandini, was designed by Della Porta, contains frescoes by Arpino, and now belongs to the Borghese family. The villa Ruffinella or Tusculana dates from the 16th century

was for some time in the possession of Lucien Bonaparte, and afterwards passed into the hands of King Victor Emmanuel. In the chapel are the tombs of Lucien Bonaparte, his wife, his father, and his son Joseph. The villa Mondragone, the largest of all, was erected by Cardinal Altemps in the 16th century, now belongs to the Borghese family, and is partly occupied by a Jesuit school. The villa Conti, formerly known as the Ludovisi, is the property of the Torlonia family. The villa Falconieri, having been founded in 1550 by Cardinal Ruffini, ranks as the oldest in Frascati; and the villa Piccolomini is interesting as the place where Baronius composed part of his *Annals*. About 3 miles from Frascati is the Greek monastery of Grotta Ferrata, interesting mainly for the frescoes of Domenichino in the chapel of St. Nilus, the best of the Greek manuscripts formerly contained in its library having been removed to Rome. The extensive gardening operations of the people of Frascati have rendered the name "Frascatese" almost equivalent to garden-girl. In 1901 the population was 9,132. For Roman remains and history see TUSCULUM.

FRASER, JAMES BAILLIE (1783–1856), Scottish diplomatist, traveller, and author, was born at Reelick or Relig in the county of Inverness, in June, 1783. He was the eldest of the four sons of Edward S. Fraser of Reelick, all of whom found their way to the East, and gave proof of their ability. When Reza Kooleé Murza and Nejeff Kooleé Murza, the exiled Persian princes, visited England, he was appointed to be their *mehmindar*, and on their return he accompanied them as far as Constantinople. He was afterwards sent to Persia on a diplomatic mission by Lord Glenelg, and effected a most remarkable journey on horseback through Asia Minor to Teheran. His health, however, was impaired by the fatigue and exposure; and he consequently retired to his estate in Scotland. In 1823 he married a daughter of Lord Woodhouselee, and sister of Patrick Fraser Tytler. He died at Reelick in January, 1856. Fraser is said to have displayed great skill in water-colors, and several of his drawings have been engraved; and the astronomical observations which he took during some of his journeys did considerable service to the cartography of Asia. The works by which he attained his literary reputation were accounts of his travels and fictitious tales illustrative of Eastern life. In both he employed a vigorous and impassioned style, which was on the whole wonderfully effective in spite of minor faults in taste and flaws in structure. Some of his tales have not yet altogether lost their popularity.

In 1820 there appeared a *Journal of a Tour through part of the Snowy Range of the Himala Mountains;* in 1825, a *Narrative of a Journey into Khorasan in the years 1821 and 1822, including an Account of the Countries to the North-East of Persia;* and in 1826, *Travels and Adventures in the Persian Provinces on the Southern Banks of the Caspian Sea.* The first part of *The Kuzzilbash, a Tale of Khorasan*, was published in 1828, and the second part or continuation in 1830, under the title of the *Persian Adventurer.* These were followed in 1833 by *The Khan's Tale*, of which the scene is laid in Khorasan. In 1834 appeared a *History of Persia* (in the Edinburgh Cabinet Library), and in 1838 a *Narrative of the Residence of the Persian Princes in London, 1835–6*, and *A Winter Journey (Tâtar) from Constantinople to Teheran, with Travels through various parts of Persia.* Next came *Travels in Koordistan and Mesopotamia*, 1840; *The Highland Smugglers*, 1842; *Allee Neemroo*, 1842; *The Dark Falcon, a Tale of the Attruck*, 1844; *Mesopotamia and Assyria* (Edinburgh Cab. Lib.), 1847; *Military Memoirs of Lieut.-Col. Skinner*, 1851.

FRASER, SIMON. See LOVAT.

FRASERBURGH, a seaport town of Scotland, Aberdeenshire, on the south side of Kinnaird's Head, 42 miles north of Aberdeen. It is built nearly in the form of a square, and most of the streets cross each other at right angles. The cross is a fine structure of an hexagonal form, covering an area of 500 feet, and surmounted by a stone pillar 12 feet high, ornamented by the British arms and the arms of Fraser of Philorth. Fraserburgh is one of the chief stations of the herring fishing in Scotland, the number of herring boats engaged by the curers of the port averaging about 900. During the herring season the increase to the population of the town is upwards of 10,000. In 1877 the number of barrels of herrings cured in Fraserburgh was 180,000, and the value of the herring landed was about £280,000. The harbor, originally constructed as a refuge for British ships of war, is one of the best on the east coast of Scotland, and has lately been improved by the widening of the piers and the extension of the breakwaters. The total sum expended on the harbor from 1857 to 1877 was £87,485. It has an area of upwards of six acres, is easy of access, and affords anchorage for vessels of every size. Still further improvements are proceeding, which, when completed, will afford outside the harbor an area of 8 acres of sheltered water, with a depth of from one to two fathoms at low tide. The population of Fraserburgh in 1901 was 9715.

Fraserburgh takes its name from Sir Alex. Fraser of Philorth, who in 1613 obtained for it a charter as a burgh of regality, and whose representative, Lord Saltoun, is now superior of the town. The same Sir A. Fraser obtained in 1592 a charter for the institution and endowment of a college and university here; and at the west end of the town is a quadrangular tower of three stories which formed part of the building designed for this seminary. The intention was subsequently abandoned, probably from want of funds.

FRATRICELLI was a common name given to a number of obscure mediæval sects who flourished in the 13th and 14th centuries. They were also called Bioschi, Bighini, Bocasoti, Frérots, etc., and included such sects as the Brethren of the Full Spirit, the Brethren of the Free Spirit, the Beghards, the Brethren of the Common Life, etc. The history of these mediæval sects is very obscure; but it seems now made out that while they had some relation to and sympathy with the older Cathari and other Manichæan heretics, they had a distinct origin in the Franciscan order, and that their real aim was to carry out the principles of St. Francis even in defiance of the court of Rome. Their origin has been traced to Peter of Macerata and Peter of Fossombrone, who put themselves at the head of certain malcontent Franciscans, who, having been condemned by Pope Celestine in 1294, declared that the rule of Francis was of more authority than any pope, and that papal opposition only showed that the pope himself might become anti-Christian. They soon began to teach opposition to the pope, the clergy, and the church. They held millenarian views, and preached and practised communism after the fashion, they said, of the early Christians. Their opinion soon spread among the Franciscan Tertiaries, and the common people everywhere favored them. Boniface VIII. ordered the Inquisition to look after them, and on a report of Matthew of Chieti they were condemned in 1297 and handed over to the Inquisition. This only roused opposition. They held a general meeting in Rome, elected a pope of their own, organized themselves, spread over Europe, and by preaching missions made converts everywhere. Their ranks were continually recruited from the malcontent friars, especially from the Franciscans. Pope John XXII. condemned them under the names of Fratricelli, Fratres de pauperi vita, Bizochi, and Bighini, and issued briefs against them in 1322 and 1331. They gave great trouble to the church in Strasburg, Cologne, and the Rhineland. In Italy their headquarters were in the Mark of Ancona and in Turin, where persecutions were organized against them in 1335, 1368, 1373–88. Popes Martin V., Eugenius IV., and Nicholas V. also persecuted them. In spite of all they survived until the Reformation. Their smouldering fire probably burnt itself out in the Anabaptist movement of the 16th century.

The best collective accounts are to be found in Mosheim, *De Beguinis et Beguinabus*, and Hahn's *Gesch. der Ketzer im Mittelalter*, vol. ii. bk. iv.

FRAUD, in law, is a word of wide import, to which it is difficult to assign any exact definition. The courts have in fact deliberately refrained from defining it, because they did not wish to limit their power of dealing with fraudulent transactions. The word, however, carries its own meaning on the face of it, and there is practically no difference between fraud in the popular and fraud in the legal sense. Any course of conduct that would generally be described as dishonest, any cheating or deceiving another so that he would be injured thereby, would be fraud in law as in common parlance. In some writers, indeed, there is found an attempted distinction between *legal* and *moral* fraud. The acts of a vendor who puffs the goods he sells are, it is said, in so far as they conceal the truth or produce a false impression in the mind of the buyer, fraudulent from an ethical point of view. The law, however, regards them not, holding that the buyer must look to his bargain for himself. *Caveat emptor;* if he chooses to believe the assertions of the puffer when he might

verify the facts for himself, so much the worse for him. An examination of the case, however, shows that there is little or no value in the alleged distinction. The meaning of the maxim is that when the parties are dealing at arm's length, neither is in fact *deceived* by the exaggerations or depreciations of the other. If actual and intentional misrepresentation is proved the law will avoid the contract, but it will not readily listen to the claim of a man who, having the opportunity of examining what he bought, protests that he purchased on the strength of the vendor's recommendations.

The essential element in fraud is misrepresentation,—producing a false impression on the mind of another—causing him to believe that which is not true. And misrepresentation, to amount to fraud, must also be intentional. There is a wide difference between a false statement believed to be true by the person who makes it and a false statement known to be false by the person who makes it The latter is clearly fraudulent, and although it would not be safe to set this down as a sufficient definition of fraud, something of this sort will be found to exist in all conduct which is recognized as legally or morally fraudulent. The innocent misrepresentation of facts is, both in law and in common morality, a much less serious thing than wilful misrepresentation. The latter would include not merely the cases where the statement is known to be false by the person making it, but also the cases in which the statement is made recklessly without any belief one way or the other. He who deliberately makes a statement which he does not know or believe to be true does so at his peril, and if it turns out to be false he will find himself in the same position as if he had known it to be false from the beginning.

It is in reference to contracts that the legal treatment of fraud is of the greatest importance. The broad rule is that any contract tainted by fraud is void at the option of the party injured. Innocent misrepresentation in the sense above defined has no such effect on a contract, has in general no effect at all unless in certain exceptional cases. Thus if the representation is a *condition*, the contract is avoided if it turn out not to be true. Or if it is a *warranty*, its falsehood will give a right of action for the breach thereof. And so in certain other cases. But wilful misrepresentation or fraud taints the whole contract. Suppose a contract for the sale of goods between A and B. A, the vendor, makes statements relating to the contract which are not true. If the truth of the statements was made a condition of the contract, or if A warranted their truth, he would be responsible to B whether he in point of fact believed the statements to be true or not. In other cases he would be responsible if he knew the statements to be false or made them recklessly without any belief as to their truth or falsehood.

Statements, misrepresentations, or frauds, to be within the rule, must be such as are material to or such as have given rise to the contract. There must be *dolus dans locum contractui*. A fraudulent concealment or misrepresentation, which had no effect on the mind of the innocent party because the circumstances for which it was prepared did not arise, has no effect on the contract. And the fraud must be the fraud of one of the contracting parties or his agents. False or fraudulent statements, through which A is induced to enter into contract with B, have no effect on the contract if B was in no way privy to them. So also it has been held that the fraud must relate to the same transaction, *e.g.*, a fraudulent misrepresentation made on a former occasion by one of the contracting parties has no effect on the contract, although in point of fact it was that which induced the other party to contract.

A contract vitiated by fraud is void at the option of the party injured. He may rescind the agreement if he chooses, or he may affirm it and require the other party to place him in the same position as if the false statement had in point of fact been true. This option he must exercise within a reasonable time after discovering the misrepresentation.

Apart from contract, fraud or misrepresentation may give a right of action to the party injured thereby. A typical case is where A is induced by the false representation of B to give credit to C. A has a right of action against B for any damage he may have sustained in consequence.

It may be expedient here to notice the *Statute of Frauds* (29 Charles II., c. 3)—perhaps the most important piece of legislation in the whole statute-book. Its object is stated to be the "prevention of frauds and perjuries," and its effect is to make writing essential to the validity of many transactions. The most important sections are those relating to contracts, viz., the 4th and the 17th, almost every word of which has been the subject of numerous decisions. By the 4th section *no action shall be brought* on the contracts therein mentioned unless the agreement, or some note or memorandum thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. The contracts referred to are the following:—(1) any special promise by an executor or administrator to answer damages out of his own estate; (2) any special promise to answer for the debt, default, or miscarriage of another person; (3) any agreement made upon consideration of marriage, (4) any contract or sale of lands, tenements, or hereditaments, or any interest in or concerning them; and (5) any agreement that is not to be performed within the space of one year from the making thereof. It will be noticed that this section does not make the contract null and void, but only unactionable. The 17th section refers to sales of goods for the price (or value) of £10 and upwards, which are "not allowed to be good" unless some memorandum of the bargain has been made in writing (see CONTRACT). Arrangements by which an insolvent debtor agrees to give to one of his creditors a preference over the others without their knowledge or consent, are known as *fraudulent preferences*, and are null and void.

Fraud can hardly be said to be under that name an offence known to the criminal law; the vagueness of the conception renders it impossible to treat fraud *per se* as a crime. But there are specific offences (both at common law and by statute) of which fraud is the gist, and in dealing with these the courts have had some little difficulty in drawing the line between criminal and non-criminal fraud. At common law it would appear that only those cheats or frauds are indictable which amount to "fraudulently obtaining the property of another by any deceitful and illegal practice or token (short of felony) *which affects or may affect the public*" (Russell *On Crimes*, vol. ii.). Chief Justice Cockburn in one case stated, as the result of the authorities, that "if a person in the course of his trade, *openly and publicly carried on*, were to put a false mark upon an article so as to pass it off as a genuine one, when in fact it was only a spurious one, and the article was sold and money obtained by means of that false mark or token, that would be a cheat at common law." On the other hand, cheats by means of a bare lie or false affirmation in a private transaction are not indictable at common law; *e.g.*, when a merchant falsely pretended that a certain parcel of gum was gum seneca, whereas it was an inferior and less valuable gum, the fraud was held not indictable. And in another case where the defendant was charged with obtaining money from another by a falsehood, Chief Justice Holt said, "Shall we indict one man for making a fool of another? Let him bring his action." Frauds affecting the crown would be indictable, and so would any cheat aimed at the general public, *e.g.*, when an impostor maims himself to have a pretence for asking charity. Russell considers that the publication of false news likely to produce any *public detriment* would be criminal.

The principal criminal enactment against frauds is 24 and 25 Vict., c. 96, §§ 75–90. By § 88, "whoever shall by any false pretence obtain from any other person any chattel, money, or valuable security, with intent to defraud, shall be guilty of a misdemeanor." Other sections deal with frauds by agents, bankers, or factors, by trustees, by directors of companies (keeping fraudulent accounts, publishing false statements, etc.). Other enactments are the statutes of Elizabeth against fraudulent conveyances (13 Eliz., c. 5, and 27 Eliz., c. 4); 9 Geo. II., c. 5 (persons pretending to exercise witchcraft, tell fortunes, etc.); 25 and 26 Vict., c. 88 (forgery, trade marks, etc.); the Debtors Act, 1869 (fraudulent debtors, etc.).

The distinction between private and public frauds does not hold in the law of Scotland. Thus if a person undertake to supply an article according to sample, or an article which has been inspected and ordered, and intentionally send a substance which is not the thing contracted for at all, or which, though containing some proportion of the article ordered, is an adulterated mixture, he is guilty of falsehood, fraud, and wilful imposition (Macdonald's *Criminal Law of Scotland*). This passage may be compared with the private frauds cited above. (E. R.)

FRAUENBURG, a town of Prussia, province of East Prussia, government district of Königsberg, is situated on

the Frische Haff, and at the mouth of the Baude, 41 miles S.W. of Königsberg. It is the seat of the Roman Catholic bishop of Ermeland. The cathedral, which stands on an eminence, possesses six towers, and forms a kind of fortress. The astronomer Copernicus was canon at Frauenburg, and there is a monument to him in the cathedral. He is said to have constructed the tower containing machinery for supplying the town and neighborhood with water. The tower is no longer used for this purpose. The population of Frauenburg is 2,492.

FRAUENFELD, a town of Switzerland, capital of the canton of Thurgau (or Thurgovia), is situated in a beautiful and fertile district on the Murg, 23 miles N.E. of Zurich. It is the artillery dépôt for east Switzerland, and possesses an old castle with a tower belonging to the 10th century, an old Capuchin monastery, a townhouse, an armory, and a canton school. The chief industries are spinning and the manufacture of cotton cloth, but many of the inhabitants are engaged in agriculture. After the extinction of the countship of Alt-Frauenfeld, the town came into the possession of the counts of Kyburg, and subsequently into that of Austria. In 1799 a battle was fought there between the French and Austrians. The population in 1900, including the adjoining villages of Kurzdorf and Langdorf, was 4 629.

FRAUENLOB, the name by which a German poet of the 13th century is almost exclusively known, though his real name was Heinrich von Meissen. How he acquired the sobriquet has not been decided,—whether it was from his song in honor of the Virgin (*Die Heilige Jungfrau*), or because in another of his pieces he defended the use of the word *Frau* instead of *Wieb*, or simply because he sang much in praise of women. The last explanation is the one that has received the stamp of popular acceptance. Frauenlob was born in 1260 of a humble burgher family. His youth was spent in straitened circumstances, but he gradually acquired reputation as a singer at the various courts of the German princes. In 1278 we find him with Rudolph I. in the Marchfeld, in 1286 he was at Prague at the knighting of Wenceslaus II., and in 1311 he was present at a knightly festival celebrated by Waldemar of Brandenburg before Rostock. After this he settled in Mainz, and there, according to the popular account, founded the first school of Meister-singers. He died in 1318, and was buried in the cloisters of the cathedral at Mainz. His grave is still marked by a copy made in 1783 of the original tombstone of 1318; and in 1842 a monument by Schwanthaler was erected by the ladies of the city in another part of the cloisters. Frauenlob's poems make a great display of learning, and their versification abounds in tricks of rhyme. Ettmüller published a very full edition in 1843.

See Von der Hagen's *Minnesinger*, vol. iv.; Bartsch, *Meisterlieder der Kolmarer Handschrift;* and Schröer in Bartsch's *Germanist. Studien*. An English translation of Frauenlob's *Cantica Canticorum* by A. E. Kroeger appeared in 1877 at St. Louis, United States.

FRAUNHOFER, Joseph von (1787–1826), a celebrated optician, was born at Straubing in Bavaria, March 6, 1787. His father, a poor glazier, having died in 1798, young Fraunhofer in August of the following year was apprenticed to Weichselberger, a glass-polisher and looking-glass maker. Having by day no time that he could call his own, he studied the few old books that he possessed during leisure snatched from sleep. On the 21st of July, 1801, he nearly lost his life by the fall of the house in which he lodged, and the elector of Bavaria, Maximilian Joseph, who was present at his extrication from the ruins, gave him 18 ducats. With a portion of this sum he obtained release from the last six months of his apprenticeship, and with the rest he purchased a glass-polishing machine. He now employed himself in making optical glasses, and in engraving on metal, devoting his spare time to the perusal of works on mathematics and optics. In 1806 he obtained the place of optician in the mathematical institute which in 1804 had been founded at Munich by Joseph von Utzschneider, G. Reichenbach, and J. Liebherr; and in 1807 arrangements were made by Utzschneider for his instruction by Pierre Louis Guinand, a skilled optician, in the fabrication of flint and crown glass, in which he soon became an adept (see R. Wolf, *Gesch. der Wissench. in Deutschl.*, bd. xvi. p. 586). With Reichenbach and Utzschneider, Fraunhofer established in 1809 an optical institute at Benedictbeuern, near Munich, of which he in 1818 became sole manager. The institute was in 1819 removed to Munich, and on Fraunhofer's death came under the direction of G. Merz. Amongst the earliest mechanical contrivances of Fraunhofer was a machine for polishing mathematically uniform spherical surfaces. He was the inventor of the stage-micrometer, and of a form of heliometer; and in 1816 he succeeded in constructing for the microscope achromatic glasses of long focus, consisting of a single lens, the constituent glasses of which were in juxtaposition, but not cemented together. The great reflecting telescope at Dorpat was manufactured by Fraunhofer, and so great was the skill he attained in the making of lenses for achromatic telescopes that, in a letter to Sir David Brewster, he expressed his willingness to furnish an achromatic glass of 18 inches diameter. For his researches, published in the *Denkschriften der Münchener Akadamie* for 1814–15, by which he laid the foundation of solar and stellar chemistry, Fraunhofer is especially known. The dark lines of the spectrum of sunlight, earliest noted by Dr. Wollaston (*Phil. Trans.*, 1802, p. 378) were independently discovered, and, by means of the telescope of a theodolite, between which and a distant slit admitting the light a prism was interposed, were for the first time carefully observed by Fraunhofer, and have on that account been designated "Fraunhofer's lines." He constructed a map of as many as 576 of these lines, the principal of which he denoted by the letters of the alphabet from A to G; and by ascertaining their refractive indices he determined that their relative positions are constant, whether in spectra produced by the direct rays of the sun, or by the reflected light of the moon and planets. The spectra of the stars he obtained by using, outside the object-glass of his telescope, a large prism, through which the light passed to be brought to a focus in front of the eye-piece. He showed that in the spectra of the fixed stars many of the dark lines were different from those of the solar spectrum, whilst other well-known solar lines were wanting; and he hence concluded that it was not by any action of the terrestrial atmosphere upon the light passing through it that the lines were produced. He further expressed his belief that the dark lines D of the solar spectrum coincide with the bright lines of the sodium flame, a fact subsequently established by Brewster, Foucault, and Miller, and successfully accounted for by Kirchhoff. Fraunhofer was a member of the Academy of Sciences at Munich, and of the university of Erlangen. In 1823 he was appointed conservator of the Physical Cabinet at Munich, and in the following year he received from the king of Bavaria the civil order of merit. He died at Munich, June 7, 1826, and was buried near Reichenbach, whose decease had taken place eight years previously. On his tomb is the inscription "Approximavit sidera." His scientific papers were published in the *Denkschriften der Münchener Akadamie*, Gilbert's *Annalen der Physik*, and Schumaker's *Astronomische Nachrichten*.

See Optics; J. von Utzschneider, *Kurzer Umriss der Lebensgeschichte des Herrn Dr. J. von Fraunhofer*, Munich, 1826; and Merz, *Das Leben und Wirken Fraunhofers*, Landshut, 1865.

FRAUSTADT, a garrison town, and the chief town of a circle in the government district of Posen, Prussia, is situated in a flat sandy country 50 miles S.S.W. of Posen. It has an orphanage, a reformatory, a royal real-school of the first class, a higher ladies' school, and an agricultural school. Its manufactures include woollen and cotton goods, hats, morocco leather, and gloves, and it has a considerable trade in corn, cattle, and wool. Fraustadt was founded by the Dutch, and until 1343 belonged to the principality of Glogau. Near the town the Swedish general Reenskiöld defeated the Saxons on the 13th of February, 1706. The population in 1905, 7,462.

FRAYSSINOUS, Denis Antoine Luc, Comte de (1765–1841), a Gallician prelate and Bourbonist minister, distinguished as an orator and as a controversial writer, was born of humble parentage at Curières, in the department of Aveyron, on the 9th of May, 1765. After a course of training, first at the diocesan seminary of Rodez and afterwards in Paris under the priests of Saint Sulpice, he was ordained priest in 1789. In 1801 he began to give private lectures on dogmatic theology in the Faubourg Saint Jacques, and at the same time to deliver, in the church of the Carmelites, a series of "catechetical lectures," which afterwards developed into the "conferences" of Saint Sulpice, to which admiring crowds were attracted by his lucid exposition and by his graceful and glowing oratory. The

freedom of his language in 1809, when Napoleon had arrested the pope and declared the annexation of Rome to France, led to a prohibition of his lectures; and the dispersion of the congregation of Saint Sulpice in 1811 was followed by his temporary retirement from the capital. He returned with the Bourbons, and resumed his conferences, in 1814; but the events of the Hundred Days again compelled him to withdraw into private life, from which he did not emerge until February, 1816. As court preacher and almoner to Louis XVIII., he now entered upon the period of his greatest public activity and influence. His *Panégyrique de Saint Louis*, his *Oraison Funèbre du Prince de Condé*, and other orations are said to have profoundly impressed the public mind, and their effect was still further deepened by the publication of his *Essai sur l'Indifference en Matière Religieuse* (1818). In connection with the controversy which had been raised by the signing of the reactionary concordat of 1817, he published, also in 1818 a treatise entitled *Vrais Principes de l'Église Gallicane sur la Puissance Ecclésiastique*, which though unfavorably criticised by the Ultramontane Lamennais, was received with favor by the civil and ecclesiastical authorities. The consecration of Frayssinous as bishop of Hermopolis "in partibus," his election to the French Academy, and his appointment to the grand-mastership of the university, followed in rapid succession. In 1824, on the accession of Charles X., he became minister of public instruction and of ecclesiastical affairs under the administration of Villèle; and about the same time he was created a peer of France with the title of count. His term of office was chiefly marked by the recall of the Jesuits. In 1825 he published his conferences under the title *Défense du Christianisme*. The work passed through 15 editions within 18 years, and was translated into several European languages. In 1828 he, along with his colleagues in the Villèle ministry, was compelled to resign office, and the subsequent revolution of July, 1830, led to his retirement to Rome. Shortly afterwards he became tutor to the duke of Bordeaux at Prague, where he continued to live until 1838. The remaining years of his life were passed in great privacy on his native soil. He died at St. Géniez on the 12th of December, 1841. His biography by Henrion was published in 1842, and a posthumous volume, containing some of his earlier "conferences," appeared in 1843 (*Conférences et Discours Inédits*).

FREDERICIA, or FRIDERICIA, a fortified town of Denmark, near the south-east corner of Jutland, on the shores of the Little Belt opposite the island of Funen, about 15 miles S. of Veile. It has railway communication with both south and north, and steamboats ply regularly across the Belt. It is well built, and possesses a handsome townhall, four churches, and a synagogue. There is a considerable shipping trade, and the industries comprise the manufacture of tobacco, salt, and chicory, and of cotton goods and hats. The population in 1900 was 12,714. A small fort was erected on the site of Fredericia by Christian IV. of Denmark, and his successor, Frederick III., determined about 1650 to make it a powerful fortress. Free exercise of religion was offered to all who should settle in the new town, which at first bore the name of Frederiksodde, and only received its present designation in 1664. In 1657 it was taken by storm by the Swedish general Wrangel, and in 1659, after the fortress had been dismantled, it was occupied by Frederick William of Brandenburg. It was not till 1709–10 that the works were again put in a state of defence, and the place even then continued to be of but little importance. In 1848 an attempt was made by the Danes to oppose the Prussians, who entered on May 3, and maintained their position against the Danish cannonboats. During the armistice of 1848–9 the fortress was strengthened, and soon afterwards it stood a siege of two months, which was brought to a glorious close by a successful sortie. In memory of the victory several monuments have been erected in the town and its vicinity, of which the most noticeable are the bronze statue of the Danish Land Soldier by Bissen (one of Thorwaldsen's best pupils), and the great barrow over 500 Danes in the cemetery of the Holy Trinity Church, with a bas-relief by the same sculptor. On the outbreak of the war of 1864, the fortress was again strengthened by new works and an entrenched camp; but the Danes suddenly evacuated it on 28th April after a siege of six weeks. The Austro-Prussian army partly destroyed the fortifications, and kept possession of the town till the conclusion of peace.

FREDERICK, in German FRIEDRICH, the name, signifying Rich in Peace, borne by a considerable number of European (principally German) sovereigns. The most important of these, including the compound names Frederick Augustus and Frederick William, are noticed here in the following order:—the emperors, the electors of Brandenburg and kings of Prussia, the electors and kings of Saxony, and the electors palatine.

FREDERICK I. (1123–1190), surnamed by the Italians Barbarossa, Holy Roman emperor, and one of the greatest of German sovereigns, was the son of Frederick the One-eyed of Hohenstaufen, duke of Swabia, and of Judith, daughter of Henry the Black, duke of Bavaria, and was born most probably in 1123. He succeeded his father as duke of Swabia in 1147, and in the same year accompanied his uncle Conrad III. on his disastrous crusade. As in addition to his exceptional personal qualities Frederick possessed the advantage of uniting in himself the blood of the two great rival families, the Guelphine and the Ghibelline, Conrad III., though possessing an infant son, nominated him as his successor. On the death of Conrad this choice was unanimously ratified by the assembly at Frankfort, March 4 or 5, 1152, and on the 9th of the same month Frederick received the crown of Germany at Aix-la-Chapelle. During the reign of Conrad, the Italian and imperial rights claimed by the German kings had been almost in abeyance, and it was to establish their reality that Frederick devoted the chief energies of his life. After settling various disputes among the German princes, and making arrangements for an alliance with Manuel emperor of the East against King William of Sicily, he, in October, 1154, descended with his army through the vale of Trent to hold the diet of his imperial feudatories on the plains of Roncaglia. Before this diet the Milanese had treated with contempt his messenger sent to warn them against continuing to oppress the citizens of Lodi; and when he witnessed afterwards, on his march to Piedmont, the desolation that had been caused by the Milanese, he began to sack and burn their dependencies, and after crossing the Po razed Tortona to the ground. Then having appeared, with the iron crown on his head, in the church of St. Michael's, Pavia, he set out over the Apennines to receive the imperial crown at Rome. After apprehending Arnold of Brescia as an earnest of his intentions to support the papal cause, and adjusting certain ceremonial differences with the pope, he was crowned emperor June 18, 1155; but immediately after quelling the insurrection in Rome which followed his coronation, he was compelled, by the sudden appearance of a pestilence in his army, to march towards Lombardy, and without accomplishing more than the capture of Spoleto he disbanded his troops and returned home.

For the next three years a great variety of matters detained him in Germany. Immediately on his return from Italy he put vigorous measures into execution against the robber knights; and in September, 1156, he reconciled Henry the Lion by the restoration of the duchy of Bavaria, while at the same time he pacified Henry *Jasomirgott*, his rival, by raising Austria to the rank of a duchy. Adelaide, whom he married in 1147, he had divorced in 1153 on the pretext of kinship; and, having in 1156 married Beatrice, daughter of the count of Burgundy, he received at Besançon in 1157 the homage of the Burgundian nobles. In the same year he was successful in compelling King Boleslaus of Poland to acknowledge him as his feudal lord, obtained by persuasion the same allegiance from King Geisa of Hungary, and rewarded Duke Ladislaus of Bohemia for his faithful services by giving him the rank of a king. About this time he published a manifesto against the pretensions of the pope to confer *beneficia* upon him; and when Frederick in the beginning of 1158 was preparing for a second campaign in Italy, the pope sent an embassy to explain that he did not use the word in its feudal sense.

Frederick's chief purpose in this expedition was to quell the pride of Milan. Descending into Italy by four different roads, with an army of 100,000 foot and 15,000 horse, he in 1158 laid siege to the city, which, after defying for a month his persistent and furious attacks, was compelled from scarcity of provisions to surrender, and with humiliating forms to take the oath of allegiance. He then held another diet at Roncaglia, at which, besides settling a

number of standing disputes, he recovered the right of instituting *podestas* to administer justice in the cities, assumed the nomination of the consuls, and deprived the cities and barons of the right of going to war. The adoption of these regulations—which if within the legal prerogatives of the emperor had nevertheless fallen into abeyance, and were utterly opposed to the strong spirit of independence struggling into existence in the cities—may be said to mark the first stage of his waning influence in Italy. And a second stage was reached when, on the death of Pope Adrian IV. in 1159, he determined to support the anti-pope Victor IV.; for from that time he had to contend with the ceaseless opposition and intrigues of Pope Alexander III., who fulminated against him a sentence of excommunication, March 24, 1160. It is true that Frederick in 1162 was able to spread terror throughout Lombardy by the capture and demolition of Milan; but in 1164 the cities of Verona, Vicenza, Padua, Treviso, and Venice formed a defensive league, and expelled the *podestas* and other foreign oppressors from their territories. In 1163 Frederick had punished the rebellion of Mainz against its archbishop by razing its walls and filling up its trenches; but having, on the death of Victor IV., promoted the election of the new anti-pope Pascal III., he was detained by fresh religious and political contentions in Germany till the end of 1166. Disregarding the embers of conflagration in the north of Italy, he now pushed on towards Rome, to which Alexander had returned the previous year. Doubtful as to the propriety of at once attacking the city, he laid siege to Ancona; but when he learned that the Roman citizens had rashly allowed themselves to be defeated at Tusculum, he raised the siege, and going to Rome took forcible possession of part of the Leonine city, and attacked and captured the Vatican. On the following Sunday (August 1, 1167,) the empress received in St. Peter's the imperial diadem from Pascal III., and Frederick the circlet of gold which was the sign of patrician dignity. Meanwhile behind him the cities of Lombardy had formed their famous league; even Lodi was forced to yield its assent to the alliance; and Milan springing into existence almost as by the wand of an enchanter, gave evidence of its defiant and unquenchable hostility by the demolition of the castle of Trezzo, which contained the emperor's treasure. Even at Rome his position was far from enviable, for Alexander III., having taken refuge in the Colosseum, was prepared to offer a desperate resistance. Accordingly Frederick fell upon the curious expedient of proposing that both Alexander and Pascal should resign, and another pope be elected. The citizens clamorously supported the proposal, but Alexander prevented its accomplishment by suddenly leaving Rome for Benevento. Immediately on his departure, and, to the superstitious fancies of the time, as if in token of the wrath of heaven at his expulsion, and at the sacrilegious violence done to the most sacred edifice of the holy city, suddenly, in the midst of a day of burning and sultry splendor, the whole German army with scarcely an exception was smitten by a pestilence of unexampled virulence, to which the terrors of superstition imparted both additional horror and a more deadly fatality. Frederick led the haggard and terror-stricken crowd of survivors with great difficulty to Pavia, whence at the end of the year he set out for Germany attended by about 30 horsemen; and at Susa he only saved himself from death at the hands of the citizens by escaping during the night on foot accompanied by two followers. For nearly seven years after this luckless flight he remained in Germany. On the death of Pascal III. in September, 1168, he supported the new anti-pope Calixtus III., but by doing so he only lent additional vigor to the Lombard league, who this year had founded the city which in honor of their patron Alexander III. they named Alexandria; and in 1173 they took an oath not to leave off waging war against the emperor till they drove him out of Italy. Resolved, however, on a final effort, Frederick, having collected an immense army, set out in October, 1174, on his fifth and last Italian expedition. He burned Susa to the ground, and captured Asti; but failing in a treacherous attack on Alexandria, made after he had granted it a truce, he endeavored to negotiate a peace with the League. Final terms could not, however, be agreed upon, and notwithstanding the crushing blow which his fortunes at this time sustained through the defection of Henry the Lion, he resolved when recruited by a new army from Germany to risk the battle at Legnano, which resulted in his total defeat, 29th May, 1176. Having in this battle been crushed beneath his horse, he was believed to have fallen, either wounded or dead, into the hands of the confederates; but on the third day afterwards he arrived at Pavia unhurt, but so worn out by hunger and fatigue as to be scarcely recognizable. Finding his case now desperate, he at last agreed to acknowledge the pontificate of Alexander, and also at Venice, 25th July, 1177, concluded a truce of six years with the cities. He then turned his attention to Henry the Lion, who owned himself vanquished in 1181, and was banished to England. On the expiry of the treaty of Venice, the famous treaty of Constance was signed, 25th June, 1183, by which, while the supremacy of the empire was formally recognized, the independent jurisdiction of the cities was substantially guaranteed. Henceforth, Frederick resolved to rule Italy more by conciliation than by compulsion, and while re-establishing his influence in Lombardy by granting such favors to the Milanese as secured their lasting alliance and friendship, he virtually placed Sicily under his immediate government by arranging a marriage between Constance, heiress of that kingdom, and Henry his eldest son, who, having been elected King of the Romans in his infancy, received the crown of Italy on the day of his marriage, 27th June, 1186, from the patriarch of Aquileia.

Having thus at last brought his long life-struggle to an honorable if not very triumphant close, it might have been expected that Frederick would now have been content to doff his armor, and to pass his remaining days in peace. But hearing in 1187 of the victorious progress of Saladin against the Christians in Syria, his martial ardor was again kindled, and he resolved to enter the lists against the redoubtable Saracen conqueror. This purpose he was, however, unable to carry fully out, for after two successful battles in Asia Minor, he was drowned before reaching Syria while crossing a small river in Pisidia, June 10, 1190.

Frederick I. is said to have taken Charlemagne as his model; but the contest in which he engaged was entirely different both in character and results from that in which his great predecessor achieved such a wonderful temporary success. Though Frederick failed to subdue the republics, the failure can scarcely be said to reflect either on his prudence as a statesman or his skill as a general, for his ascendency was finally overthrown rather by the ravages of pestilence than by the might of human arms. In Germany his resolute will and sagacious administration subdued or disarmed all discontent, and he not only succeeded in welding the various rival interests into a unity of devotion to himself against which papal intrigues were comparatively powerless, but won for the empire a prestige such as it had not possessed since the time of Otto the Great. The wide contrast between his German and Italian rule is strikingly exemplified in the fact that, while he endeavored to overthrow the republics in Italy, he held in check the power of the nobles in Germany, by conferring municipal franchises and independent rights on the principal cities. Even in Italy, though his general course of action was warped by wrong prepossessions, he in many instances manifested exceptional practical sagacity in dealing with immediate difficulties and emergencies. Possessing great physical beauty, frank and open manners, untiring and unresting energy, and a prowess which found its native element in difficulty and danger, he seemed the embodiment of the chivalrous and warlike spirit of his age, and was the model of all the qualities which then won highest admiration. Stern and ambitious he certainly was, but his aims can scarcely be said to have exceeded his prerogatives as emperor; and though he had sometimes recourse when in straits to expedients almost diabolically ingenious in their cruelty, yet his general conduct was marked by a clemency which in that age was exceptional. His quarrel with the papacy was an inherited conflict, not reflecting at all on his religious faith, but the inevitable consequence of inconsistent theories of government, which had been created and could be dissipated only by a long series of events. His interference in the quarrels of the republics was not only quite justifiable from the relation in which he stood to them, but seemed absolutely necessary. From the beginning, however, he treated the Italians, as indeed was only natural, less as rebellious subjects than as conquered aliens; and it must be admitted that in regard to them the only effective portion of his procedure was, not his energetic measures of repres-

sion nor his brilliant victories, but, after the battle of Lignano, his quiet and cheerful acceptance of the inevitable, and the consequent complete change in his policy, by which if he did not obtain the great object of his ambition, he at least did much to render innoxious for the empire his previous mistakes.

The principal contemporary authorities for the reign of Frederick I. are the chronicle of Otto bishop of Freisingen, to which is prefixed a letter of Frederick containing a summary of the early events of his reign; the continuation of this chronicle from 1158 to 1160 by Radevic, one of the canons of Otto; the chronicle of Otto Morena of Lodi, continued from 1162 to 1167 by his son Acerbus; and the life of Pope Alexander III. by the cardinal of Aragon. The chief modern writers are Muratori, *Annali d'Italia;* Sismondi, *Histoire des Républiques Italiennes;* H. v. Bünau, *Leben und Thaten Friedrichs I.*, Leipsic, 1722; Cherrier, *Histoire de la lutte des papes et des empereurs de la maison de Souabe*, etc., 2d edition, Paris, 1856; F. von Raumer, *Geschichte der Hohenstaufen und ihrer Zeit*, 4th ed., Leipsic, 1871; P. Scheffer-Boichorst, *Friedrichs letzter Streit mit der Curie*, Berlin, 1866; K. Fischer, *Der Kreuzzug Friedrichs I.*, Leipsic, 1870; H. Prutz, *Kaiser Friedrich I.*, 3 vols., Dantzic, 1871–73; Fr. X. Wegele, *Kaiser Friedrich I. Barbarossa, ein Vortrag*, Nordlingen, 1871; Dettloff, *Der erste Römerzug Kaiser Friedrichs I.*, Göttingen, 1877; Bryce, *Holy Roman Empire;* Milman, *History of Latin Christianity;* C. Vignati, *Storia diplomatica della lega Lombarda*, Milan, 1866; Teste, *History of the Wars of Frederick I. and the Communes of Lombardy*, English translation, 1877; and E. A. Freeman in his first series of *Essays.* (T. F. H.)

FREDERICK II. (1194–1250), Holy Roman Emperor, surnamed the Hohenstaufen, the most remarkable historic figure of the Middle Ages, grandson of the preceding, and son of Henry VI. and of Constance, heiress of the throne of Sicily, was born at Jesi, near Ancona, 26th December, 1194. He was elected king of the Romans in 1196; and, his father having died 28th September, 1197, he was in May, 1198, crowned king of Sicily, his mother obtaining for him the recognition and support of Pope Innocent III. by acknowledging the feudal supremacy of the papacy, by the sacrifice of certain ecclesiastical rights, and by the payment of a yearly tribute. Dying the same year, she bequeathed his guardianship to the pope; but for some time after this Sicily was the scene of hopeless political anarchy, and the custody of the young king at Palermo was the occasion of continual and complicated intrigues, and of a confused and protracted civil war which had very varying results. The pope could thus only fulfil his trust imperfectly, but the education of his ward, so far from suffering on this account, was exceptionally thorough and complete; and the different nationalities with which he came into contact contributed each its quota to the instruction and development of his strong and many-sided character.

Though crowned in infancy king of the Romans, he actually inherited from his father no other throne than that of Naples and Sicily. In 1208 he entered upon the personal government of his kingdom, and in the following year he was married to Constance of Aragon. About this time, Otto, second son of Henry the Lion, had, on account of the murder of Philip of Hohenstaufen by Otto of Wittelsbach, obtained undisputed possession of the throne of Germany; but immediately after his coronation at Rome in 1209 the inevitable jealousy between pope and emperor led to the usual results, and when Otto was meditating the subjugation of Naples and Sicily, he was met in 1211 by a bull of excommunication. At a diet held at Nuremberg in October of the same year it was resolved to offer the crown of Germany to the young king of Sicily. Innocent III. on certain conditions gave his sanction to the offer; and to Frederick, even had he seen in it nothing to incite his imaginative ardor, it must have appeared almost in the form of an unexpected deliverance from impending ruin. Having therefore resolved to dispute his ancestral throne with his rival, he set out in the spring of 1212 on his romantic and hazardous quest. Landing at Genoa on the 1st of May accompanied by only a few adherents, he made his way over the Alps by unfrequented passes to Coire, and learning at St. Gall that Otto was about to occupy Constance, he by great good fortune was able to anticipate him by three hours. The town at once declared in Frederick's favor, and Otto, without seriously attempting to resist his progress in southern Germany, retired to Saxony. In November of the same year Frederick made a treaty with Philip of France, and in December he was elected king at Frankfort, and crowned at Mainz. By inherent force of character, aided by his unrivalled diplomatic skill and his bold and rapid movements, he had won success almost without striking a blow; and his task was at least denuded of all difficulty through Otto's disastrous defeat by Philip at Bouvines, near Tournay, 27th July, 1214. Any further organized resistance was thus rendered impossible against the progress of the Hohenstaufen, who in July, 1215, ascended the marble throne of Charlemagne at Aix-la-Chapelle, and received the silver crown. At a solemn ceremony which followed he took the cross; but even after the death of Otto in May, 1218, he was fully occupied in establishing his influence in Germany. In 1220 he succeeded in obtaining the election of his son Henry to the German throne, but the favor was dearly rewarded by the charter which by the independent privileges it conferred upon the princes virtually dissolved the unity of the kingdom. The election was contrary to a promise made to Pope Innocent III. to appoint Henry king of Sicily, but Pope Honorius III., anxious for the success of the crusade, was pacified without much difficulty, and Frederick leaving Germany in the autumn of 1220 was crowned emperor at Rome on the 22d November, renewing at the same time his oath to set out on the crusade with all possible speed. His absence in Germany had permitted the growth of disorder and confusion in his southern kingdom; and to restrain the license of the Apulian nobles he now established at Capua a tribunal to revise their privileges, while, to deliver the Christians in Sicily from the attacks to which they were continually exposed from the Saracen mountain tribes, he transferred 2000 Saracens to Luecra, an expedient which also established in Italy a convenient instrument of resistance to the papal power.

The departure of the crusade, at first fixed for 1223, was deferred till 1225, and even then it was found necessary to delay it for two years longer; but, his wife Constance having died in 1222, he gave a pledge that his ambition coincided with the papal wishes by marrying in 1225 Yolande, daughter of King John of Jerusalem; and he also bound himself by heavy penalties to set out with a stipulated force in August, 1227. The hostilities between him and the Lombard league, begun in 1226, were suspended through the intercession of Pope Honorius in February, 1227, and the Lombards agreed to furnish a certain number of knights for the expedition. In March Honorius died, and was succeeded by Gregory IX., who on the very day of his accession addressed a new and imperative warning to the emperor against delay in the fulfilment of his oath. Frederick actually set out at the time agreed upon, but returned three days afterwards, and, asserting as his reason a serious illness, permitted the armament to be dissolved, whereupon Gregory without further negotiation launched against him, September 30, the solemn bull of excommunication. The appeal to Christendom with which Frederick met the church's fulmination is remarkable in that, so far from contenting himself with defending his own conduct, he, besides denouncing the temporal pretensions of the pope as menacing the whole of Christendom with an "unheard-of tyranny," asserted that instead of rolling in wealth and aspiring to worldly influence the church's representatives ought to cultivate the simplicity and self-denial of the early Christians. In resolving to set out on the crusade, notwithstanding his excommunication, Frederick was therefore actuated, not merely by the wish to take possession of a secular throne, or to demonstrate the sincerity of his purpose to keep his oath, but by the determination to assert his right still to act as the temporal head of the church. His preparations were not delayed by the death of his wife Yolande in April, 1228, and he set sail from Otranto on the 29th June. Meanwhile, by securing the favor of the Frangipani and the other Roman patricians, he procured the expulsion of Gregory from Rome; but the subtle spiritual influence of the papal ban was not affected by this seeming victory, and tidings of his excommunication reaching the Holy Land almost simultaneously with his arrival, the Knights of the Temple and the Hospital refused to take part in the crusade. Frederick, however, by mere diplomatic tact succeeded in persuading the sultan of Egypt to agree to a treaty, by which the church obtained possession of Jerusalem and the holy places on granting to the Saracens, besides various other privileges, free access to Bethlehem; and on the 18th March, 1229, he, without any religious ceremony, crowned

himself with his own hands king of Jerusalem. Such a striking and unexpected success wrought almost immediately throughout Europe a complete revolution of opinion in his favor; and when shortly afterwards he succeeded in defeating the papal forces which had invaded his dominions the pope deemed it expedient to come to terms, and released him from the ban of excommunication 28th August, 1230.

In the interval of peace which followed, Frederick occupied himself in forming for his Sicilian kingdom a code of laws, the main features of which were the superseding of irresponsible feudal and ecclesiastical jurisdictions by a uniform civil legislation administered under direct imperial control; the toleration extended to Jews and Mahometans, and the severe enactments against schismatics; the provisions for the emancipation of the peasants; the regulations for the encouragement of commerce, which contain perhaps the first enunciation of the modern doctrine of free trade; and the establishment of annual parliaments, consisting of barons, prelates, and representatives from the towns and cities. He also devoted much of his attention to the advancement of learning and of the arts and sciences. The university of Naples, founded in 1224, but whose operations had been for some time suspended, he now restored and liberally endowed; at the medical schools of Salerno he provided Arab, Latin, Greek, and Hebrew teachers for the students of these different nationalities; and he caused the translation into Latin of the works of Aristotle and of other philosophers both Greek and Arabic. He himself was learned both in Mussulman arts and sciences and in Christian scholasticism and philosophy; he knew Latin, Greek, French, German, Arabic, and Hebrew. He had a great interest in architecture, and he fostered the infancy of Italian sculpture and painting; he and his minister Peter de Vinea were among the first cultivators of Italian poetry; he also devoted much attention to natural history, and besides forming large collections of rare and curious animals wrote a treatise on the art of falconry, which shows a minute acquaintance with the habits of birds. With the influences of Western civilization there was conjoined at his castles on the Apulian shore an Oriental luxury and splendor; and in the harem of the Christian emperor his accusers found a convenient corroboration of their insinuation regarding his secret enmity to the Christian faith.

The short period of peaceful progress was broken in 1234 by the rebellion of Frederick's son Henry, who, secretly instigated by the pope, joined the Lombard league. The revolt was, however, suppressed on the arrival of the emperor in Germany in 1235, and Henry was sent as a prisoner to the castle of San Felice in Apulia. In the same year Frederick married Isabella, sister of Henry III. of England. Conrad, second son of the emperor, was chosen king by the German princes in January, 1237; and Frederick, after the disastrous defeat of the Lombards at Cortenuova, November 27th of this year, appointed, in October, 1238, his natural son Enzio king of Sardinia. Alarmed at the success of the imperial arms, Gregory, in March, 1239, renewed against the emperor the ban of excommunication; but the latter advancing into the states of the church, captured Ravenna, Faenza, and Benevento; and after gaining, through the help of Enzio, a brilliant victory over the Genoese fleet, was nearing Rome when Gregory died, August 21, 1241. After the short pontificate of Celestine IV. and an interregnum of eighteen months, Cardinal Sinibald Fiesco, up to this time one of the emperor's chief friends, became pope as Innocent IV. in June, 1243. At once negotiations were entered into for an arrangement between them; but the papal demands were too humiliating to permit of their acceptance; and Innocent, suddenly making his escape to Lyons, not only renewed, July 17, 1245, the church's ban against the emperor, but declared his throne vacant. Henry Raspe of Thuringia, elected by the papal party king of the Romans in May, 1246, gained a victory over Conrad at Frankfort on the 5th August, but, suffering a total defeat near Ulm, February 17, 1247, died shortly afterwards; and between his successor William of Holland and Conrad the struggle was carried on with indecisive results. In this same year Peter de Vinea, the minister and most intimate friend of Frederick, was discovered plotting against his life; on 18th February, 1248, Frederick's army in Italy was surprised and utterly routed by a sally of the citizens of Parma; in May, 1249, his son Enzio was defeated and captured by the Bolognese; and, although in 1250 various successes in the north of Italy and the prospect of new and powerful alliances seemed to promise him a speedy and complete triumph, his strength had been so worn out by his arduous struggle, and his spirit so broken by such a succession of disasters, that he died somewhat suddenly on the 13th December, at his hunting lodge of Fiorentino (also called Firenzuola), near Lucera.

The general contemporary opinion regarding Frederick II. is expressed in the words *stupor mundi*; and whatever amount either of approbation or censure may be bestowed upon his career, wonder and perplexity are the predominant sentiments which its contemplation even yet awakens. It was not merely that his mental endowments were exceptionally great, but that, owing to his mingled German and Italian blood, the various influences to which he was subjected in his early years, the strange times in which he lived, and the events with which destiny had connected him, his character was exhibited in such multiform aspects and in such an individual and peculiar light that in history we look in vain for his parallel. As to the nature of his religious faith there are no data for arriving at a certain conclusion. The theory of M. Huillard-Bréholles that he wished to unite with the functions of emperor those of a spiritual pontiff, and aspired to be the founder of a new religion, is a conjecture insufficiently supported by the isolated facts and statements and the general considerations on which it is made to rest. Indeed the character of Frederick seems to have been widely removed from that of a religious enthusiast; and at every critical period of his life he was urged to daring and adventurous projects rather by external circumstances than by either the promptings of ambition or the consciousness of any divine commission. On any theory his enactments in reference to religion are, however, somewhat enigmatical. His persecution of heretics may not have been entirely due to a desire to vindicate his orthodoxy before his Christian subjects; but although his ideas regarding freedom of conscience were either inconsistent or hampered in their action by a regard to expediency, his toleration of the Jews equally with the Mahometans prevents us ascribing his toleration of the latter either to secret sympathy with that form of faith or wholly to political considerations. He was in all probability a believer in astrology, and he shared in many of the other superstitious ideas of his time; but there is no indication that he dreaded any other than temporal consequences from the ban of the church; and if certain features of the Christian system had perhaps an attraction for him, yet both from his reported jests and serious conversation it is evident that his Christian belief, if he possessed one, bore little resemblance to that current in his age. In the extravagant accusations of cruelty, perfidy, and licentiousness with which the church has assailed his memory there is some nucleus of truth; but a candid judgment will arrive at the conclusion that few exposed to such pernicious influences have shown such a decided preference for goodness and truth, and that there have been almost none who against such immense difficulties have wrought to such wise purpose in behalf of human progress and enlightenment, or have fought such a resolute and advantageous battle in behalf of spiritual freedom. In this contest he was not an immediate victor; and indeed the dissolution of the imperial power in Italy which followed his death must be chiefly traced to the fact that his policy was governed by principles too much in advance of his age. But although the beneficial results of his reign are not at a first glance so palpable and undeniable as some of its injurious results, yet so far was he from being a mere untimely precursor of the new era which dawned in Europe more than two centuries after his death that, perhaps in a greater degree than any other, he was instrumental in hastening its arrival, both by sowing the first seeds of the Renaissance in Italy, and by giving to the old system of things a shock which was felt throughout Europe, and continued to work silently long after its reverberations had passed away.

After the death of Frederick the followers of Abbot Joachim continued to assert that he was still alive, and both in Sicily and Germany impostors sprang up who attempted to personate him. The superstition that the "emperor continued to haunt the castle of Kyffhäuser," at one time thought to refer to Frederick Barbarossa, has now been shown to have had its origin in the tradition that

Frederick II. still lived after he had ceased to exercise the functions of emperor.[1]

The contemporary documents bearing on the reign of Frederick are unusually numerous. Most of those not contained in the *Fœdera* of Thomas Rhymer, the *Annales eccles. post Baronium* of Raynaldus, or the historical collections of Muratori, Bouquet, Böhmer, or Pertz will be found in the great work of Huillard-Bréholles, *Historia Diplomatica Frederici Secundi*, 12 vols., Paris, 1852–1861. The principal ancient chronicles are the *Historia Major Angliæ* of Matthew Paris; the chronicle of the Franciscan monk Salimbene, first published in *Monumenta ad provincias Parmensem et Placentinam spectantia*, Parma, 1857; the *Life of Gregory IX.*, by the Cardinal of Aragon; the *Annales Mediolanenses, 1230–1402;* the *Chronicon Rerum per Orbem Gestarum* (1159–1242) of Richard de San Germano; and the *Chronicon Placentinum* and *Chronicon de rebus in Italia gestis*, published in one volume by M. Huillard-Bréholles, Paris, 1856, the former printed from the copy in the Imperial Library, Paris, and the latter never before published, and printed from the copy in the British Museum. The chief modern authorities are Muratori, Cherrier, Von Raumer, Milman, Freeman as above under FREDERICK I.; Giannone, *Storia del Regno di Napoli*, 1723; Hoeffer, *Kaiser Frederich II.*, Munich, 1844; the great work of Huillard-Bréholles, and also his *Vie et Correspondance de Pierre de la Vigne*, Paris, 1866; T. L. Kington, *History of Frederick the Second, Emperor of the Romans*, London, 1862; Schirrmacher, *Kaiser Friedrich II.*, 4 vols., Göttingen, 1859–65; Winkelmann, *Geschichte Kaiser Friedrichs II. und seiner Reiche*, vol. i., Berlin, 1863, vol. ii., Revel, 1865, and a continuation for the years 1239–41 in the *Forschungen zur deutschen Geschichte*, xii. 261–294, 521–566; A. del Vecchio, *La legislazione di Federico II. Imperatore*, Turin, 1874; and Reuter, *Geschichte der religiösen Aufklärung im Mittelalter*, vol. ii., Berlin, 1877. (T. F. H.)

FREDERICK III. (1286–1330), surnamed the Fair, son of King Albert I. of Germany, duke of Austria, and rival for the German crown with Louis IV. the Bavarian. See LOUIS IV.

FREDERICK IV. (1415–1493), German king, as emperor Frederick III., son of Duke Ernest of Styria, was born at Innsbruck, September 21, 1415. Along with his brother Albert the Prodigal he assumed in 1435 the government of Styria, Carinthia, and Carniola, and, having been elected in 1440 to succeed Albert II. as king of Germany, he was crowned at Aix-la-Chapelle in 1442. He devoted his chief attention to the study of astrology, alchemy, and botany, and was so undecided in his purposes and so deficient in energy and force of character that he almost passively submitted to the anarchy and petty external wars which during the whole of his reign disturbed the peace of the empire. At the beginning of his reign he was attacked by his brother Albert, who reigned in Upper Austria, and he found it necessary to pacify him by the payment of a large sum of money; in 1443 he was attacked by the Swiss, and called to his aid the Armagnacs from France, who, however, after their defeat by the Swiss at St. Jakob in 1444, joined his enemies against him, and in 1449 he was compelled to agree to an unfavorable treaty; from 1445 to 1452 Austria was invaded by the Hungarians; in 1447 Sforza successfully usurped the government of Milan; from 1449 to 1456 a war was carried on between Albert of Brandenburg and the city of Nuremberg assisted by the "Eidgenossen;" and from 1449 to 1462 a succession war raged in the Rhenish Palatinate. Frederick, who hoped by cultivating the friendship of the Papacy to win back some of the ancient imperial rights, concluded in 1448 the concordat of Vienna with Pope Nicholas V., and was crowned emperor in 1452. On the death of Ladislaus duke of Austria in 1457, he laid claim to the whole of Austria, and also to the crown of Bohemia and Hungary; but not only was George Podiebrad made king of Bohemia and Matthias Corvinus king of Hungary, but Sigismund of Tyrol obtained part of Carinthia, and Frederick's brother Albert, besides seizing Upper Austria in 1462, took possession of Vienna. On the death of Albert in 1463, Frederick obtained possession of the whole of Austria, with the exception of Carinthia. Notwithstanding that Frederick in 1468 went to Rome to concert measures with the pope against the Turks, they in 1469 penetrated without resistance to Carniola, and in 1475 advanced nearly to Salzburg. In 1473 he suddenly broke off a negotiation with Charles the Bold at Treves for the marriage of Charles's daughter with his son Maximilian, but the marriage finally took place after the death of Charles, and Maximilian thus became king of the Netherlands. The changeful and crooked policy of the emperor in reference to Poland and Hungary led the kings of both countries to turn their arms against him, and in 1485 Matthias of Hungary drove him from his hereditary dominions, of which he did not regain possession till after the death of Matthias in 1490. Frederick died in 1493.

FREDERICK WILLIAM (1620–1688), elector of Brandenburg, was born in Berlin in 1620. He is usually called "The Great Elector," and next to Frederick the Great he was the chief founder of the power of Prussia. A man of immense energy and determination, he devoted himself to his country, missing no opportunity, whether by intrigue or by force of arms, of adding to its extent and its influence. When at the age of twenty (1640) he succeeded to the electorate, he found it almost ruined. His father, George William, being of feeble and vacillating character, had been unable to prevent the inroads of the contending armies during the Thirty Years' War; and they had laid waste nearly the whole land, and treated the inhabitants with horrible cruelty. Frederick William, by skilful management, succeeded in getting rid of these barbarous hordes, and by slow degrees collected an army of about 30,000 men, which very effectually secured for him the respect of his neighbors. It was universally admitted that he was the true heir of the dukes of Pomerania, whose line died out in 1637; but at the Peace of Westphalia the lion's share of their territory was ceded to Sweden, Frederick William receiving only the eastern half of the country, shorn of Stettin. But he also obtained the bishopries of Halberstadt, Minden, and Camin, with a promise of the archbishopric of Magdeburg. In 1655 war broke out between Sweden and Poland. Charles Gustavus, king of Sweden, compelled Frederick William to join him, and to do homage for Prussia, which had formerly been held in fief of Poland. After a battle of three days at Warsaw, the Poles were defeated (1656). In the following year the elector turned round and concluded an alliance with the Poles, receiving, by the treaty of Wehlau, in return for the promise of his aid, an acknowledgment of the complete independence of Prussia. Charles Gustavus uttered fierce threats of vengeance, but was prevented by sudden death from attempting to execute them. Frederick William had much trouble in inducing the states of Prussia to do homage to him as their sole lawful sovereign; but by a happy mingling of severity and kindness, he overcame in the end all opposition. As duke of Prussia he was now an absolutely independent sovereign, although still owing allegiance to the emperor for his other dominions. In 1666 he received, by the settlement of the Jülich-Cleve dispute, the duchy of Cleve proper, and the counties of Mark and Ravenstein; while Jülich and Berg were to fall to Brandenburg in the event of the Pfalz-Neuburg line dying out. When Louis XIV. invaded the Netherlands in 1674, Frederick William saw the danger which threatened Germany, and his own territories in particular; he therefore persuaded the emperor, various German princes, and the king of Denmark to form an alliance against the French. He soon withdrew from this contest, but in the war which began with the second French invasion of the Netherlands in 1674 he took a leading part. The Swedes sided with France, and were persuaded by Louis XIV. to invade Brandenburg, which they easily overran and devastated. The elector was unable to leave the seat of war for some time, but at last, in the summer of 1675, set out from Franconia, hastening forward with his cavalry, directing the infantry to follow as speedily as possible. Halting at Magdeburg, he heard that the Swedes were divided into three parties, and that the middle party was not more than forty miles off. Although overtaken only by a small body of his infantry, he rapidly advanced on this middle party, and on June 18, at Fehrbellin, after a severe struggle, decisively defeated it. The rest of the Swedes were then easily disposed of. He drove them not only from Brandenburg but from Pomerania, of which he became complete master. Between three and four years afterwards (about Christmas,

[1] Regarding the *Friedrichsage*, see papers by C. Voigt, S. Riezler, and M. Brosch, in the 26th, 32d, and 35th volumes of H. von Sybel's *Historische Zeitschrift*.

1678) they invaded Prussia, threatening Königsberg. In the dead of winter Frederick started from Berlin with a powerful force, and in the middle of January, 1679, finally beat them, crossing the Frische Haff with 4000 men on sledges. After all, however, he did not obtain Pomerania, for when the peace of St. Germain-en-Laye was concluded in 1679, Louis XIV. insisted on its being restored to his ally, the king of Sweden. Frederick William, indignant at Austria for allowing this, maintained for a time an alliance with France; but he had ultimately to cultivate the friendship of the emperor, from whom he hoped to obtain the Silesian principalities of Liegnitz, Brieg, and Wohlau, which, after 1675, he claimed as his by inheritance. He received the circle of Schwiebus, in Silesia (1686), on condition that he should withdraw his claim and send 8000 men to the help of the emperor in his war with the Turks. Two years afterwards he died. Although famous as a soldier, he was even greater as an administrator. He was the most economical ruler of his age, yet did no injustice to any branch of the state service. Among the most important of his public works may be named the canal between the Oder and the Spree, which still bears his name. After the revocation of the edict of Nantes, he welcomed large numbers of French refugees to his dominions; and long before that time he had offered every encouragement to Flemish settlers, thus giving a powerful impulse to industry and commerce. He was twice married,—his first wife, Louise Henrietta, being a pious and energetic lady, endowed with so clear and penetrating an understanding that her husband took no important step without consulting her.

FREDERICK I. (1657–1713), the first king of Prussia, was born at Königsberg, 1657. He was the son of the Great Elector by his first marriage. In consequence of a fall from the arms of his nurse his spine was so seriously injured that he was deformed for life. His stepmother intrigued against him incessantly in the interests of her children; and she succeeded in persuading her husband to make a will whereby Frederick should receive only the electoral title and the electoral lands, the remaining territories being divided among his half-brothers. On his accession in 1688 this will was set aside, with the sanction of the emperor, whose support he had obtained beforehand by signing away in his father's lifetime his rights in Schwiebus, a proceeding which, he afterwards maintained, restored his claim to the Silesian principalities. Frederick, having a strong love of pomp and show, strove hard to make his court an imitation of that of Louis XIV. Although without his father's firmness and energy, he seized every occasion of increasing his dominions by purchase; and he obtained, partly in virtue of certain claims inherited from his mother, partly through the influence of William III. of England, the principality of Neufchatel. It had been the intention of the Great Elector to give William III. vigorous support both in his struggle for the English crown and in the wars with France which were seen to be inevitable. Frederick gave effect to this purpose, and his troops played an important part in the battle of the Boyne. In the course of his reign he exercised considerable influence on European politics by placing auxiliary forces at the disposal of friendly princes. The accession of Augustus the Strong of Saxony to the throne of Poland fired his ambition, and for years he endeavored to induce the emperor Leopold I. to recognize him as king of Prussia. At last, in November, 1700, the emperor consented, insisting, however, on various strict conditions, one of which was that in the approaching war of the Spanish succession Prussia should contribute a force of 10,000 men to the Austrian army. Immediately after receiving the imperial sanction, Frederick started with his whole court for Königsberg, where, on January 18, 1701, with much ceremony he crowned himself. He sent 20,000 men into the war of the Spanish succession, and a portion of them did excellent service at the battle of Blenheim. In 1706 Prince Leopold of Dessau led 6000 Prussians to victory at Turin. Frederick died on the 25th February, 1713. By his extravagance he not only exhausted the treasure amassed by his father, but burdened his country with heavy taxes. He was not, however, an unpopular sovereign, and by making Prussia a kingdom he undoubtedly advanced it several stages towards its future greatness. He founded the university of Halle and the Berlin Academy of Sciences, and was fond of protecting enlightened men who suffered persecution. He was three times married, his second wife, Sophie Charlotte, sister of George I. of England, being well known as the friend of Leibnitz and as one of the most cultivated princesses of the age.

FREDERICK WILLIAM I. (1688–1740), king of Prussia, son of Frederick I. by his second marriage, was born in 1688. He spent a considerable time in early youth at the court of his grandfather, the elector of Hanover. On his return to Berlin he was placed under General von Dohna, who trained him to the energetic and regular habits that ever afterwards characterized him. He was soon imbued with a passion for military life, and this was deepened by acquaintance with the duke of Marlborough and Prince Eugene, whom he visited during the siege of Tournay. In nearly every respect he was the opposite of his father, having frugal, simple tastes, a passionate temper, and a determined will. He intensely disliked the French, and highly disapproved the imitation of their manners by Frederick I. and his courtiers. When he mounted the throne, his first act was to dismiss from the palace every unnecessary official, and to regulate the royal household on principles of the strictest parsimony. In 1715 he was forced, in alliance with Russia, Saxony, and Denmark, into a war with Charles XII. of Sweden, in consequence of which, in return for two million thalers paid to Sweden, he obtained the islands of Wollin and Usedom, Stettin, and part of Swedish Pomerania. This was his only war. All through his reign he strenuously insisted on his right to Jülich and Berg in the event of the Pfalz-Neuburg line dying out (which it seemed certain to do), and his anxiety respecting these duchies gives the key to most of his foreign policy. For some time he inclined to an understanding with England and Hanover; but in 1726 he formed an alliance with Austria, and in the Polish war of succession (1733–35) aided her with 10,000 men. Ultimately, however, he perceived that the emperor was not acting honorably by him, and withdrew from the alliance, occupying himself solely with the internal affairs of his kingdom. He despised many things which the modern world holds in high esteem, and was often coarse, violent, and fond of hideous practical jokes. Nevertheless Prussia profited immensely by his reign. He saw the necessity of rigid economy not only in his private life but in the whole administration of the state; and the consequence was that he paid off the debts incurred by his father, and left to his successor an overflowing treasury. He did nothing for the higher learning, and even banished the philosopher Wolf at 48 hours' notice, "on pain of the halter," for teaching, as he believed, fatalist doctrines; but he established many village schools, and he encouraged industry by every means in his power, particularly agriculture. Under him the nation flourished, and although it stood in awe of his vehement spirit, it respected him for his firmness, his honesty of purpose, and his love of justice. He was devoted to his army, the number of which he raised from 48,000 to 83,500; and there was not in existence a more thoroughly drilled or better appointed force. The Potsdam guard, made up of giants collected from all parts of Europe, sometimes kidnapped, was a sort of toy with which he amused himself. The reviewing of his troops was his chief pleasure; but he was also fond of meeting his friends in the evening in what he called his "tobacco college," where he and they, amid clouds of tobacco smoke, discussed affairs of state. He died on the 31st May, 1740, leaving behind him his widow, Sophie Dorothea of Hanover, and a numerous family.

See Morgenstern, *Ueber Friedrich Wilhelm I.* (Brunswick, 1793); J. C. Droysen, *Friedrich Wilhelm I., König von Preussen* (2 vols., Leipsic, 1869); Carlyle, *History of Friedrich II. of Prussia.*

FREDERICK II. (1712–1786), king of Prussia, born on the 24th January, 1712, was the son of Frederick William I., and is usually known as Frederick the Great. He was brought up with extreme rigor, his father devising a scheme of education which was intended to make him a hardy soldier, and prescribing for him every detail of his

conduct. So great was Frederick William's horror of everything which did not seem to him practical, that he strictly excluded Latin from the list of his son's studies. Frederick, however, had free and generous impulses which could not be restrained by the sternest system. Encouraged by his mother, and under the influence of his governess, Madame de Roucoulle, and of his first tutor Duhan, a French refugee, he acquired an excellent knowledge of French, and a taste for literature and music. He even received secret lessons in Latin, which his father had invested with all the charms of forbidden fruit. As he grew up he became extremely dissatisfied with the dull and monotonous life he was compelled to lead; and his discontent was heartily shared by his sister, Wilhelmina, a bright and intelligent young princess for whom Frederick had a warm affection. Frederick William, seeing the divergence of his son's tastes from his own, gradually conceived for him an intense dislike, which often found expression in violent outbursts of anger. So harsh was his treatment that Frederick frequently thought of running away and taking refuge at the court of his uncle, George II. of England; and he at last resolved to do so during a journey which he made with the king to South Germany in 1730, when he was eighteen years of age. He was helped by his two friends, Lieutenant Katte and Lieutenant Keith; but by the imprudence of the former the secret was found out. Frederick was placed under arrest, and the king abused him so cruelly on board a yacht at Frankfort that some courtiers had to interfere, and to separate them. Warned by Frederick, Keith escaped; but Katte delayed his flight too long, and a court martial decided that he should be punished with two years' fortress arrest. The king changed this sentence into one of death, and the young soldier was executed outside the fortress of Cüstrin, in which Frederick was kept a close prisoner. On the way to the place of execution Katte had to pass the crown prince's window. "Pardonnez moi, mon cher Katte," cried Frederick, who was broken-hearted at the fate he had brought upon his friend. "La mort est douce pour un si aimable prince," replied Katte. The same court-martial which had judged him decided that as a lieutenant-colonel attempting to desert, the crown prince had incurred the legal penalty of death. For some time the king actually thought of giving effect to the sentence; and he at last relented only in consequence of grave expostulations from the emperor and the kings of Sweden and Poland.

For about fifteen months Frederick now lived in the town of Cüstrin, having an establishment of his own, but serving as the youngest councillor at the Government board there. He took great care not to offend his father, and was partially restored to favor. In 1732 he was made colonel commandant of a regiment in Ruppin, and in the following year he married, in obedience to the king's orders, the Princess Elizabeth Christina, daughter of the duke of Brunswick-Bevern. The palace of Rheinsberg in the neighborhood of Ruppin was built for him, and there he lived until he succeeded to the throne. These years were perhaps the happiest of his life. He discharged his duties with so much spirit and so conscientiously that he ultimately gained the esteem of Frederick William, who no longer feared that he would leave the crown to one unworthy of wearing it. At the same time the crown prince was able to indulge to the full his personal tastes. He carried on a lively correspondence with Voltaire and other French men of letters, and was a diligent student of philosophy, history, and poetry. Two of his best known works were written at this time,—*Considérations sur l'état présent du corps politique de l'Europe* and his *Anti-Macchiavel*. In the former he calls attention to the growing strength of Austria and France, and insists on the necessity of some third power, by which he clearly means Prussia, counterbalancing their excessive influence. The second treatise, which was issued by Voltaire in Hague in 1740, contains a generous exposition of some of the favorite ideas of the 18th century philosophers respecting the duties of sovereigns.

In 1740 he became king. He maintained all the forms of government established by his father, but ruled in a far more liberal and enlightened spirit; he tolerated every form of religious opinion, granted considerable freedom to the press even in political discussion, was most careful to secure an exact and impartial administration of justice, and allowed every one with a genuine grievance free access to his presence. The Potsdam regiment of giants was disbanded, but the real interests of the army were as carefully studied by Frederick as by Frederick William. On the year of his accession, the emperor Charles VI. died. Frederick at once began to make extensive military preparations, and it was soon clear to all the world that he intended to enter upon some serious enterprise. He had made up his mind to take possession of Silesia. For this resolution he is often abused still by historians, and at the time he had the approval of hardly any one out of Prussia. He himself, writing of the scheme in his *Mémoires*, laid no claim to lofty motives, but candidly confessed that "it was a means of acquiring reputation and of increasing the power of the state." He firmly believed, however, that he had inherited lawful claims to the Silesian principalities; and although his father had recognized the Pragmatic Sanction, whereby the hereditary dominions of Charles VI. were to descend to his daughter, Maria Theresa, Frederick insisted that this sanction could refer only to lands which rightfully belonged to the house of Austria. He could also urge that, as Charles VI. had not fulfilled the engagements by which Frederick William's recognition of the Pragmatic Sanction had been secured, Prussia was freed from her obligation. Frederick cannot fairly be charged with having let loose the elements of war which desolated Europe during the next few years, for, independently of him, the elector of Bavaria instantly protested against the Pragmatic Sanction, and there can be no doubt that in any case France would have taken advantage of so favorable a chance of breaking the power of Austria.

Frederick sent an ambassador to Vienna, offering, in the event of his rights in Silesia being conceded, to aid Maria Theresa against her enemies. The queen of Hungary, who regarded the proposal as that of a mere robber, haughtily declined; whereupon Frederick immediately invaded Silesia with an army of 30,000 men. His first victory was gained at Mollwitz on the 10th of April, 1741. Under the impression, in consequence of a furious charge of Austrian cavalry, that the battle was lost, he rode rapidly away at an early stage of the struggle,—a mistake which gave rise for a time to the groundless idea that he lacked personal courage. A second Prussian victory was gained at Chotusitz, near Czeslau, on the 17th May, 1742, by which time Frederick was master of all the fortified places of Silesia. Maria Theresa, in the heat of her struggle with France and the elector of Bavaria, now Charles VII., and pressed by England to rid herself of Frederick, concluded with him, on the 11th June, 1742, the peace of Breslau, conceding to Prussia Upper and Lower Silesia as far as the Oppa, together with the county of Glatz. Frederick made good use of the next two years, fortifying his new territory, and repairing the evils inflicted upon it by the war. By the death of the prince of East Friesland without heirs, he also gained possession of that country. He knew well that Maria Theresa would not, if she could help it, allow him to remain in Silesia; accordingly, in 1744, alarmed by her victories, he arrived at a secret understanding with France, and pledged himself, with Hesse-Cassel and the palatinate, to maintain the imperial rights of Charles VII., and to defend his hereditary Bavarian lands. Frederick began the second Silesian war by entering Bohemia in August, 1744, and taking Prague. By this brilliant but rash venture he put himself in great danger, and soon had to retreat; but in 1745 he gained the battles of Hohenfriedberg, Sorr, and Hennersdorf; and Leopold of Dessau ("Der alte Dessauer") won for him the victory of Kesselsdorf in Saxony. The latter victory was decisive, and the peace of Dresden (December 25, 1745) assured to Frederick a second time the possession of Silesia.

Frederick had thus, at the age of thirty-three, raised himself to a great position in Europe, and henceforth he was the most conspicuous sovereign of his time. He was a thoroughly absolute ruler, his so-called ministers being mere clerks whose business was to give effect to his will. To use his own famous phrase, however, he regarded himself as but "the first servant of the state;" and during the next eleven years he proved that the words expressed his inmost conviction and feeling. All kinds of questions were submitted to him, important and unimportant; and he is frequently censured for having troubled himself so much with mere details. But in so far as these details related to expenditure he was fully justified, for it was absolutely essential for him to have a large army, and with a small state this was impossible unless he carefully prevented unnecessary outlay. Being a keen judge of character, he filled the public

offices with faithful, capable, energetic men, who were kept up to a high standard of duty by the consciousness that their work might at any time come under his strict supervision. The Academy of Sciences, which had fallen into contempt during his father's reign, he restored, infusing into it vigorous life; and he did more to promote elementary education than any of his predecessors. He made canals between the Oder and the Elbe, and the Oder and the Havel, and all kinds of manufacture, particularly silk manufacture, owed much to his encouragement. To the army he gave unremitting attention, reviewing it at regular intervals, and sternly punishing negligence on the part of the officers. Its numbers were raised to 160,000 men, while fortresses and magazines were always kept in a state of readiness for war. The influence of the king's example was felt far beyond the limits of his immediate circle. The nation was proud of his genius, and displayed something of his energy in all departments of life. Lessing, who as a youth of twenty came to Berlin in 1749, composed enthusiastic odes in his honor, and Gleim, the Halberstadt poet, wrote of him as of a kind of demi-god. These may be taken as fair illustrations of the popular feeling long before the Seven Years' War.

He despised German as the language of boors, although it is remarkable that at a later period, in a French essay on German literature, he predicted for it a great future. He habitually wrote and spoke French, and had a strong ambition to rank as a distinguished French author. Nobody can now read his verses, but his prose writings have a certain calm simplicity and dignity, without, however, giving evidence of the splendid mental qualities which he revealed in practical life. To this period belong his *Mémoires pour servir à l'histoire de Brandebourg*, and his poem *L'Art de la Guerre*. The latter, judged as literature, is intolerably dull; but the former is a narrative of some value, throwing considerable light on his personal sympathies as well as on the motives of important epochs in his career. He continued to correspond with French writers, and induced a number of them to settle in Berlin, Maupertuis being president of the Academy. In 1752 Voltaire, who had repeatedly visited him, came at Frederick's urgent entreaty, and received a truly royal welcome. The famous Hirsch trial, and Voltaire's vanity and caprice, greatly lowered him in the esteem of the king, who, on his side, irritated his guest by often requiring him to correct bad verses, and by making him the object of rude banter. The publication of *Doctor Akakia*, which brought down upon the president of the Academy a storm of ridicule, finally alienated Frederick; while Voltaire's wrongs culminated in the famous arrest at Frankfort, the most disagreeable elements of which were due to the misunderstanding of an order by a subordinate official.

The king lived as much as possible in a retired mansion, to which he gave the name of Sanssouci,—not the palace so called, which was built after the Seven Years' War, and was never a favorite residence. He rose regularly in summer at five, in winter at six, devoting himself to public business till about eleven. During part of this time, after coffee, he would aid his reflections by playing on the flute, of which he was passionately fond, being a really skilful performer. At eleven came parade, and an hour afterwards, punctually, dinner, which continued till two, or later, if conversation happened to be particularly attractive. After dinner he glanced through and signed cabinet orders written in accordance with his morning instructions, often adding marginal notes and postscripts, many of which were in a caustic tone. These disposed of, he amused himself for a couple of hours with literary work; between six and seven he would converse with his friends or listen to his reader (a post held for some time by La Mettrie); at seven there was a concert; and at half-past eight he sat down to supper, which might go on till midnight. He liked good eating and drinking, although even here the cost was sharply looked after, the expenses of his kitchen mounting to no higher figure than £1800 a year. At supper he was always surrounded by a number of his most intimate friends, mainly Frenchmen; and he insisted on the conversation being perfectly free. His wit, however, was often cruel, and any one who responded with too much spirit was soon made to feel that the license of talk was to be complete only on one side.

At Frederick's court ladies were seldom seen, a circumstance that gave occasion to much scandal for which there seems to have been no foundation. The queen he visited only on rare occasions. She had been forced upon him by his father, and he had never loved her; but he always treated her with marked respect, and provided her with a generous income, half of which she gave away in charity. Although without charm, she was a woman of many noble qualities; and, like her husband, she wrote French books, some of which attracted a certain attention in their day. She survived him by eleven years, dying in 1797.

Maria Theresa had never given up hope that she would recover Silesia; and as all the neighboring sovereigns were bitterly jealous of Frederick, and somewhat afraid of him, she had no difficulty in inducing several of them to form a scheme for his ruin. Russia and Saxony entered into it heartily; and France, laying aside her ancient enmity towards Austria, joined the empress against the common object of dislike. Frederick, meanwhile had turned towards England, which saw in him a possible ally of great importance against the French. A convention between Prussia and Great Britian was signed in January, 1756, and it proved of incalculable value to both countries, leading as it did to a close alliance during the administration of Pitt. Through the treachery of a clerk in the Saxon foreign office, Frederick was made aware of the future which was being prepared for him. Seeing the importance of taking the initiative, and, if possible, of securing Saxony, he suddenly, on the 24th August, 1756, crossed the frontier of that country, and shut in the Saxon army between Pirna and Königstein, ultimately compelling it, after a victory gained over the Austrians at Lowositz, to surrender. Thus began the Seven Years' War, in which, supported by England, Brunswick, and Hesse-Cassel, he had for a long time to oppose Austria, France, Russia, Saxony, and Swedeu. Virtually, the whole Continent was in arms against a small state which, a few years before, had been regarded by most men as beneath serious notice. But it happened that this small state was led by a man of high military genius, capable of infusing into others his own undaunted spirit, while his subjects had learned both from him and his predecessors habits of patience, perseverance, and discipline. In 1757, after defeating the Austrians at Prague, he was himself defeated by them at Kolin; and by the shameful convention of Closter-Seven, he was freely exposed to the attack of the French. In November, 1757, however, when Europe looked upon him as ruined, he rid himself of the French by his splendid victory over them at Rossbach, and in about a month afterwards, by the still more splendid victory at Leuthen, he drove the Austrians from Silesia. From this time the French were kept well employed in the west by Prince Ferdinand of Brunswick, who defeated them at Crefeld in 1758, and at Minden in 1759. In the former year Frederick triumphed, at a heavy cost, over the Russians at Zorndorf; and although, through lack of his usual foresight, he lost the battle of Hochkirchen, he prevented the Austrians from deriving any real advantage from their triumph, Silesia still remaining in his hands at the end of the year. The battle of Kunersdorf, fought on August 12, 1759, was the most disastrous to him in the course of the war. He had here to contend both with the Russians and the Austrians; and although at first he had some success, his army was in the end completely broken. "All is lost. Save the royal family," he wrote to his minister Friesenstein; "the consequences of this battle will be worse than the battle itself. I shall not survive the ruin of the Fatherland. Adieu for ever!" But he soon recovered from his despair, and in 1760 gained the important victories of Liegnitz and Torgau. He had now, however, to act on the defensive, and, fortunately for him, the Russians, on the death of the czarina Elizabeth, not only withdrew in 1762 from the compact against him, but for a time became his allies. On October 29 of that year he gained his last victory over the Austrians at Freiberg. Europe was by that time sick of war, every power being more or less exhausted. The result was, that, on February 15, 1763, a few days after the conclusion of the peace of Paris the treaty of Hubertsburg was signed, Austria confirming Prussia in the possession of Silesia.

It would be difficult to overrate the importance of the contribution thus made by Frederick to the politics of Europe. Prussia was now universally recognized as one of the great powers of the Continent, and she definitely took her place in Germany as the rival of Austria. From this time it was inevitable that there should be a final struggle between the two nations for predominance, and that the smaller German states should group themselves around one or the other. Frederick himself acquired both in Germany and Europe the indefinable influence which springs from

the recognition of great gifts that have been proved by great deeds.

His first care after the war was, as far as possible, to enable the country to recover from the terrific blows by which it had been almost destroyed; and he was never, either before or after, seen to better advantage than in the measures he adopted for this end. Although his resources had been so completely drained that he had been forced to melt the silver in his palaces and to debase the coinage, his energy soon brought back the national prosperity. Pomerania and Neumark were freed from taxation for two years, Silesia for six months. Many nobles whose lands had been wasted received corn for seed; his war horses were within a few months to be found on farms all over Prussia; and money was freely spent in the re-erection of houses which had been destroyed. The coinage was gradually restored to its proper value, and trade received a favorable impulse by the foundation of the Bank of Berlin. All these matters were carefully looked into by Frederick himself, who, while acting as generously as his circumstances would allow, insisted on everything being done in the most efficient manner at the least possible cost. Unfortunately, he adopted the French ideas of excise, and the French methods of imposing and collecting taxes,—a system known as the Regie. This system secured for him a large revenue, but it led to a vast amount of petty tyranny, which was all the more intolerable because it was carried out by French officials. It was continued to the end of Frederick's reign, and nothing did so much to injure his otherwise immense popularity. He was quite aware of the discontent the system excited, and the good-nature with which he tolerated the criticisms directed against it and him is illustrated by a well known incident. Riding along the Jäger Strasse one day, he saw a crowd of people. "See what it is," he said to the groom who was attending him. "They have something posted up about your Majesty," said the groom, returning. Frederick, riding forward, saw a caricature of himself: "King in very melancholy guise," says Preuss (as translated by Carlyle), "seated on a stool, a coffee-mill between his knees, diligently grinding with the one hand, and with the other picking up any bean that might have fallen. 'Hang it lower,' said the king, beckoning his groom with a wave of the finger; 'lower that they may not have to hurt their necks about it.' No sooner were the words spoken, which spread instantly, than there rose from the whole crowd one universal huzzah of joy. They tore the caricature into a thousand pieces, and rolled after the king with loud '*Lebe Hoch*, our Frederick for ever,' as he rode slowly away." There are scores of anecdotes about Frederick, but not many so well authenticated as this.

There was nothing about which Frederick took so much trouble as the proper administration of justice. He disliked the formalities of the law, and in one instance, "the Miller-Arnold case," in connection with which he thought injustice had been done to a poor man, he dismissed the judges, condemned them to a year's fortress-arrest, and compelled them to make good out of their own pocket the loss sustained by their supposed victim,—not a wise proceeding, but one springing from a generous motive. He once defined himself as "l'avocat du pauvre," and few things gave him more pleasure than the famous answer of the miller whose windmill stood on ground which was wanted for the king's garden. The miller sturdily refused to sell it. "Not at any price?" said the king's agent; "could not the king take it from you for nothing, if he chose?" "Have we not the Kammergericht at Berlin?" was the answer, which became a popular saying in Germany. Soon after he came to the throne Frederick began to make preparations for a new code. In the year 1749–51 his grand-chancellor, Von Cocceji, a man of wide knowledge and solid judgment, finished "The Project of the Corporis Juris Fridericiani," which was afterwards made the basis of a legal system drawn up by the grand-chancellor Von Cramer—a system that came into operation in 1794 under Frederick's successor.

Looking ahead after the Seven Years' War, Frederick saw no means of securing himself so effectually as by cultivating the good will of Russia. In 1764 he accordingly concluded a treaty of alliance with the empress Catherine for eight years. Six years afterwards, unfortunately for his fame, he joined in the first partition of Poland, by which he received Polish Prussia, without Dantzic and Thorn, and Great Poland as far as the Netzefluss. Prussia was then for the first time made continuous with Brandenburg and Pomerania. Frederick would have run great risks had he refused to take part in this arrangement; but it was none the less a shameful violation of international law, the full penalty for which has perhaps not even yet been paid.

The emperor Joseph II., being of an ardent and impulsive nature, greatly admired Frederick, and visited him at Neisse, in Silesia, in 1769, a visit which Frederick returned, in Moravia, in the following year. The young emperor was frank and cordial; Frederick was more cautious, for he detected under the respectful manner of Joseph a keen ambition that might one day become dangerous to Prussia. Ever after these interviews a portrait of the emperor hung conspicuously in the rooms in which Frederick lived, a circumstance on which some one remarked. "Ah yes," said Frederick, "I am obliged to keep that young gentleman in my eye." Nothing came of these suspicions till 1777, when, after the death of Maximilian Joseph, elector of Bavaria, without children, the emperor took possession of the greater part of his lands. The elector palatine, who lawfully inherited Bavaria, came to an arrangement, which was not admitted by his heir, the duke of Zweibrücken, afterwards King Maximilian I. of Bavaria. The latter appealed to Frederick, who, resolved that Austria should gain no unnecessary advantage, took his part, and brought pressure to bear upon the emperor. Ultimately, greatly against his will, Frederick felt compelled to draw the sword, and in July, 1778, crossed the Bohemian frontier at the head of a powerful army. No general engagement was fought, and after a great many delays, the treaty of Teschen was signed on the 13th May, 1779. Austria received the circle of Burgau, and consented that the king of Prussia should take the Franconian principalities. Frederick never abandoned his jealousy of Austria, whose ambition he regarded as the chief danger against which Europe had to guard. He seems to have had no suspicion that evil days were coming in France. It was Austria which had given trouble in his time; and if her pride were curbed, he fancied that Prussia at least would be safe. Hence one of the last important acts of his life was to form, in 1785, a league of princes (the "Fürstenbund") for the defence of the imperial constitution, believed to be imperilled by Joseph's restless activity. The league came to an end after Frederick's death; but it is of considerable historical interest, as the first open attempt of Prussia to take the lead in Germany.

Frederick's chief trust was always in his treasury and his army. By continual economy he left in the former the immense sum of 70 million thalers; the latter, at the time of his death, numbered 200,000 men, disciplined with all the strictness to which he had throughout life accustomed his troops. He died at Sanssouci on the 17th August, 1786; his death being hastened by exposure to a storm of rain, stoically borne, during a military review. He passed away on the eve of tremendous events, which for a time obscured his fame; but now that he can be impartially estimated, he is seen to have been in many respects one of the greatest figures in modern history.

He was rather below the middle size, in youth inclined to stoutness, lean in old age, but of vigorous and active habits. An expression of keen intelligence lighted up his features, and his large, sparkling, gray eyes darted penetrating glances at every one who approached him. In his later years an old blue uniform with red facings was his usual dress, and on its breast was generally some Spanish snuff, of which he consumed large quantities. He shared many of the chief intellectual tendencies of his age, having no feeling for the highest aspirations of human nature, but submitting all things to a searching critical analysis. Of Christianity he always spoke in the mocking tone of the "enlightened" philosophers, regarding it as the invention of priests; but it is noteworthy that after the Seven Years' War, the trials of which steadied his character, he sought to strengthen the church for the sake of its elevating moral influence. He cannot be truly described as an atheist, for he regarded the world as probably the creation of a demiurgus,—of a demiurgus, however, who could not be supposed to take interest in the petty affairs of men. In his judgments of mankind he often talked as a misanthrope He was once conversing with Sulzer, who was a school inspector, about education. Sulzer expressed the opinion that education had of late years greatly improved. "In former times, your Majesty," he said, "the notion being that man-

kind were naturally inclined to evil, a system of severity prevailed in schools; but now, when we recognize that the inborn inclination of men is rather to good than to evil, schoolmasters have adopted a more generous procedure." "Ah, my dear Sulzer," replied the king, "you don't know this damned race" ("Ach, mein lieber Sulzer, er kennt nicht diese verdammte Race"). This fearful saying unquestionably expressed a frequent mood of Frederick's; and he sometimes acted with great harshness, and seemed to take a malicious pleasure in tormenting his acquaintances. Yet he was capable of genuine attachments. He was beautifully loyal to his mother and his sister Wilhelmina; his letters to the duchess of Gotha are full of a certain tender reverence; the two Keiths found him a devoted friend. But the true evidence that beneath his misanthropical moods there was an enduring sentiment of humanity is afforded by the spirit in which he exercised his kingly functions. Taking his reign as a whole, it must be said that he looked upon his power rather as a trust than as a source of personal advantage; and the trust was faithfully discharged according to the best lights of his day. He has often been condemned for doing nothing to encourage German literature; and it is true that he was supremely indifferent to it. Before he died a tide of intellectual life was rising all about him; yet he failed to recognize it, declined to give Lessing even the small post of royal librarian, and thought *Götz von Berlichingen* a vulgar imitation of vulgar English models. But when his taste was formed, German literature did not exist; the choice was between Racine and Voltaire on the one hand and Gottsched and Gellert on the other. He survived into the era of Kant, Goethe, and Schiller, but he was not of it, and it would have been unreasonable to expect that he should in old age pass beyond the limits of his own epoch. As Germans now generally admit, it was better that he let their literature alone, since, left to itself, it became a thoroughly independent product. Indirectly he powerfully promoted it by deepening the national life from which it sprang. At a time when there was no real bond of cohesion between the different states, he stirred among them a common enthusiasm; and in making Prussia great he laid the foundation of a genuinely united empire.

In 1846–57, Frederick William IV. caused a magnificent edition of Frederick's writings to be issued by the Berlin Academy, under the supervision of Preuss. It is in 30 volumes, of which 6 contain verse, 7 are historical, 2 philosophical, and 3 military, 12 being made up of correspondence.

See Carlyle, *History of Friedrich II. of Prussia;* Droysen, *Friedrich der Grosse* (2 vols., Leipsic, 1874–76, forming Part v. of his *Geschichte der Preussischen Politik*); F. Förster, *Friedrich der Grosse, geschildert als Mensch, Regent, und Feldherr* (4th ed., Berlin, 1860); Rigollot, *Frédéric II., Philosophe* (Paris, 1875); Schröder, *Friedrich der Grosse in seinen Schriften* (3 vols., Leipsic, 1875–76). (J. SI.)

FREDERICK WILLIAM II. (1744–1797), king of Prussia, was the nephew of Frederick the Great. His father, Augustus William, the second son of Frederick William I., having died in 1757, Frederick William was nominated by the king successor to the throne. He was of an easy-going nature, fond of pleasure, and without the capacity for hard work that characterized his foremost predecessors. His loose mode of life alienated from him the sympathies of his uncle, into whose presence he was not admitted for several years. In the war of the Bavarian succession in 1778, however, he received an expression of approval from Frederick in consequence of an act of personal courage. When he mounted the throne, Prussia held a high place on the Continent; her military fame was splendid; and the national finances were in a flourishing condition. The young king had some good impulses, and made himself popular for a time by lightening a few of the burdens of the people, abolishing the tyrannical method of collecting taxes which Frederick had instituted, and encouraging trade. He gave himself up, however, to the advice of unworthy favorites, and soon lost the goodwill both of his subjects and of Europe. For a time he continued the decided policy of his uncle towards Austria, vigorously supporting Turkey against her in 1790. But in the same year he concluded the Reichenbach convention, whereby a nominally good understanding was effected between the two countries, various difficulties being removed during a personal interview of Frederick William with the emperor Leopold II. at Pillnitz in 1791. In 1792, associating himself with the emperor in the war with France, Frederick William sent across the Rhine an army of 50,000 men under the duke of Brunswick. A separate peace was concluded by Prussia in 1795. The dilatoriness with which he prosecuted this war was due to jealousy respecting the policy of Austria and Russia towards Poland. He had formally recognized in 1790 the integrity of Poland; but in 1793, after a vast amount of intrigue, he took part with Russia in the second partition, gaining thereby what is now called South Prussia, with Dantzic and Thorn. The following year brought the third partition, which extended Prussia from the Niemen to Warsaw. Some time before these partitions, in consequence of an understanding with the margrave, signed December 2, 1791, the king had gained possession of the principalities of Baireuth and Anspach. The size and population of Prussia were thus largely increased under Frederick William II.; but, except in the case of Baireuth and Anspach, he attained his aims by means which the more intelligent class of his subjects did not approve, and by his vacillating policy he greatly lowered the state in the esteem of the world. He not only exhausted the resources accumulated by Frederick the Great, but imposed on the country a burden of debt; and he excited much ill-feeling by introducing a severe censorship of the press, and by subjecting the clergy to laws conceived in a spirit of the narrowest orthodoxy. He died on the 16th November, 1797. His first wife having been divorced in 1769, he married the Princess Louise of Hesse-Darmstadt, by whom he had five sons.

FREDERICK WILLIAM III. (1770–1840), king of Prussia, was the eldest son of Frederick William II., and was born on the 3d August, 1770. He was carefully trained under the supervision, in early youth, of his grand-uncle, Frederick the Great. As crown prince he accompanied his father in 1791, to the interview with the emperor at Pillnitz, and in the following year visited with him the army in the Rhine country which was making war with France. In 1793 he married the Princess Louise, daughter of the duke of Mecklenburg-Strelitz. She became a highly popular queen, and thoroughly deserved the affection and respect with which she was regarded. Simple and unostentatious in manner, she was of a refined and gentle disposition, yet endowed with a quick and keen intelligence, and with an heroic spirit which the greatest disasters could not break. Her husband's character was not nearly so interesting. He was rather dull and slow; but he had a sincere desire for the welfare of his people; was capable in emergencies of undertaking a great enterprise, and allowed himself to be freely influenced by the loftier impulses of his wife. When he succeeded to the throne he at once removed the principal grievances due to the weakness of his father, and called to his aid capable and honest ministers. By the treaty of Lunéville, in 1801, he was obliged to concede to Napoleon his territory on the left bank of the Rhine; but he received some compensations. In 1805 he was brought for a short time into conflict with England for accepting Hanover from Napoleon in return for certain concessions. Up to this time he had remained at peace with France; but the formation of the Confederation of the Rhine in 1806 filled him with alarm and indignation, and, giving way to a sudden impulse, he demanded that all French troops should forthwith quit German soil. The result was the battles of Jena and Auerstädt, followed by those of Eylau and Friedland; and on July 9, 1807, he had to sign the treaty of Tilsit, which deprived him of half his kingdom. Early in the war he had been obliged to leave Berlin with the queen, and not till the end of 1809 were they able to return. In 1810 the queen died. Meanwhile, under the guidance of the great minister Stein, who was succeeded by Hardenberg, he had begun thoroughly to reorganize the state; while, through the exertions of Scharnhorst and Gneisenau, the army, in which the traditions of a past age had survived too long, was raised to a state of high efficiency. The king was forced in 1812 to conclude an alliance with Napoleon, and to aid him with an auxiliary corps in his expedition to Russia; but seeing the disastrous retreat of the French from Moscow, Frederick William appealed to the country to undertake a war of liberation. In due time the appeal was followed by the battle of Leipsic and the battle of Waterloo. After the conclusion of peace he labored sincerely, with the aid of competent ministers, to undo many of the evils caused by the confusion of the previous years; but he forgot that in

his time of need he had promised to set up a constitutional system of government. He only instituted (1817) provincial estates; and after the July Revolution he proved himself an uncompromising and bitter opponent of liberal ideas. He died on the 7th of June, 1840.

See W. Hahn, *Friedrich Wilhelm III. und Louise* (2d ed., Berlin, 1876); Duncker, *Aus der Zeit Friedrichs des Grossen und Friedrich Wilhelms III.* (Leipsic, 1876).

FREDERICK WILLIAM IV. (1795–1861), king of Prussia, the son of Frederick William III., was born on the 15th October, 1795. He took an active part in the War of Liberation, and in 1814 spent some time in Paris, in whose museums and picture galleries he acquired a warm love of art. On returning to Berlin he cultivated his artistic tastes under the guidance of Rauch and Schinkel, receiving at the same time instruction in jurisprudence and finance from Savigny and other distinguished teachers. He married Princess Elizabeth of Bavaria in 1823, but had no children. As he was known to be cultivated, intelligent, and generous, high hopes were formed respecting his reign; and these hopes were fostered by his first acts as king, for he conceded greater freedom of the press than had been allowed under his father, granted an amnesty to political prisoners, and invited to his capital some of the leading writers and artists of the day. He soon, however, disappointed popular expectations. He was a lover rather of large phrases than of great actions, being very willing to benefit his subjects, but on condition that they should accept what he offered them as the gift of an absolute ruler. In 1847 he assembled at Berlin a united diet, made up of representatives of the provincial diets established by his father, and created intense discontent by proclaiming that he would not allow a constitution to stand between him and his people. The revolutionary movement of 1848 took him wholly by surprise, and he was so alarmed that he not only promised to institute parliamentary government, but placed himself at the head of the agitation for the unity of Germany. When, however, in 1849 the national assembly at Frankfort offered him the title of emperor, he declined it. He formed an alliance with Hanover and Saxony for the purpose of creating a new German constitution, and summoned a national parliament at Erfurt. Austria insisted on the old Frankfort diet being re-established, and for a time war appeared to be imminent. Ultimately, by the treaty of Olmütz (1850) Austria prevailed. In 1850 the Prussian constitution was proclaimed, but it was interpreted in a narrow sense, and under the reactionary ministry of Manteuffel some of its most essential provisions were soon changed. In 1848 Neufchatel had been incorporated with Switzerland. Certain royalists having attempted in 1856 to secure it again for the king of Prussia, they were seized by the Swiss authorities and accused of high treason. After some angry negotiations they were given up, and Frederick William then formally resigned all claims to the country. On his way back from Vienna in the summer of 1857 he had a stroke of paralysis in Dresden; in October of the same year he had a second stroke in Berlin. From this time, with the exception of brief intervals, his mind was clouded, and the duties of government were undertaken by his brother William, who on October 7, 1858, was formally recognized as regent. The king spent the winter of 1858–59 in Rome, where his health occasionally improved, but when he returned to Berlin in November, 1860, his end was seen to be near, and he died at Sanssouci on the night of January 2, 1861.

See Varnhagen von Ense's *Blätter aus der Preussischen Geschichte* (5 vols., Leipsic, 1868–69); and *Briefwechsel Friedrich Wilhelms IV. mit Bunsen* (Leipsic, 1873).

FREDERICK I. (1369–1428), elector and duke of Saxony, surnamed the Pugnacious, eldest son of Landgraf Frederick the Severe of Thuringia and of Catherine countess of Henneberg, was born at Altenburg, March 29, 1369. On the death of his father in 1381, he and his two brothers succeeded to the inheritance under the guardianship of their mother, but were compelled to grant a portion of it to their father's two brothers. The death of one of their father's brothers in 1407 occasioned a renewal of the inheritance dispute with the remaining brother, and an amicable settlement was not arrived at till 1410. Previous to this Frederick had distinguished himself in wars against the Lithuanians, Hungary, and King Wenzel of Germany; and having in 1420 collected an army against the Hussites, he was for a time so uniformly successful, that in 1423 the emperor Sigismund, in recognition of his valuable services, created him elector and duke of Saxony. With these honors, however, Sigismund also laid upon him the whole burden of the Hussite war; and the result was that, by an overwhelming defeat at Aussig in 1426, nearly all the Saxons capable of bearing arms were either killed or placed *hors de combat*. Frederick did not long survive this disaster, dying at Altenburg, 4th January, 1428. The university of Leipsic was founded by Frederick in 1409.

See life by Spalatin in Menckе's *Scriptores rerum Germ.*; and life by Horn, Leipsic, 1733.

FREDERICK II. (1411–1464), elector and duke of Saxony, surnamed the Meek, son of the former and of Catherine of Brunswick, was born August 22, 1411, and succeeded his father in 1428. His reign is remarkable only for his long-continued dispute with his uncles and brothers regarding the partition of Saxony—a dispute which, though finally settled in 1451 by the interposition of the emperor in Frederick's favor, led, in 1455, to the famous attempt by a knight named Kunz von Kaufungen to abduct the two sons of Frederick, Ernst and Albert. A graphic description of the plot and its accidental frustration will be found in a paper on the "Prinzenraub" in Mr. Carlyle's *Miscellaneous Works*. Frederick died at Leipsic, 7th September, 1464.

For the literature connected with the "Prinzenraub," see W. Schäfer, *Der Montag vor Kiliani*, 1855; and J. Gersdorf, *Einige Actenstücke zur Geschichte des Sächsischen Prinzenraubes*, 1855.

FREDERICK III. (1463–1525), elector and duke of Saxony, surnamed the Wise, grandson of the preceding and son of Duke Ernst, was born at Torgau, January 17, 1463. On the death of his father in 1486, he succeeded him in the sole government of Saxony, but divided the other possessions of the Ernestine line with his brother John the Constant. Frederick founded the university of Wittenberg in 1502, and appointed Melanchthon and Luther to two of its chairs. Though he never formally adopted the principles of the Reformation, he granted to the Reformers his friendly countenance, and in 1521 he secured the safety of Luther during the diet of Worms, and afterwards sheltered him in the castle of Wartburg. In 1493 Frederick made a pilgrimage to the Holy Land, and was made in Jerusalem a knight of the Holy Sepulchre. He was three times imperial vicar, and on the death of Maximilian I. he was offered the imperial throne but declined it, and, in accordance with his recommendation, it was bestowed on Charles V. Frederick died at Lochau, 5th May, 1525.

See life published from Spalatin's manuscript by Neudecker and Preller, 1851, and another by Tutzschmann, 1848.

FREDERICK AUGUSTUS I., elector of Saxony. See AUGUSTUS II., of Poland, vol. iii. p. 74.

FREDERICK AUGUSTUS II., elector of Saxony. See AUGUSTUS III., of Poland, vol. iii. p. 74.

FREDERICK AUGUSTUS I. (1750–1827), king of Saxony, son of Elector Frederick Christian, was born at Dresden, 23d December, 1750, succeeded his father, under the guardianship of Prince Xavier, in 1763, and was declared of age in 1768. In the following year he married Princess Maria-Amelia of Deux-Ponts. On account of the claims of his mother on the inheritance of her brother, the elector of Bavaria, he sided with Frederick the Great in the short Bavarian succession war of 1778 against Austria; and he afterwards joined the league of German princes formed by that monarch. In 1791 he declined the crown of Poland. He refused to join the league against France in 1792, but when war was declared his duty to the German empire necessitated his taking part in it. He maintained his neutrality during the war between France and Austria in 1805, but in the following year he joined Prussia against France. After the disastrous battle of Jena he concluded a treaty of peace with Napoleon at Posen, 11th November, 1806, and, assuming the title of king, he joined the Rhenish confederation. Having taken part in the subsequent wars of Napoleon, he fell into the hands of the allies after the entry into Leipsic, 19th October, 1813; and although he regained his freedom after the congress of Vienna, he was compelled to give up the province of Wittenberg to Prussia. The remainder of his life was spent in developing the agricultural, commercial, and industrial resources of his kingdom, reforming the administration of justice,

establishing hospitals and other charitable institutions, encouraging art and science, and promoting education. He had a special interest in botany, and originated the beautiful botanical garden at Pillnitz. His reign throughout was characterized by justice, probity, moderation, and prudence. He died May 5, 1827.

See lives by Weisse, Leipsic, 1811; Herrmann, Dresden, 1827; and Pölitz, Leipsic, 1830.

FREDERICK AUGUSTUS II. (1797–1854), king of Saxony, eldest son of Prince Maximilian and of Caroline-Maria Theresa of Parma, was born May 18, 1797. The unsettled times in which his youth was passed necessitated his frequent change of residence, but care was nevertheless taken that his education should not be interrupted, and he also acquired through his journeys in foreign states and his intercourse with men of eminence, a special taste for art and for natural science. He was twice married—in 1819 to the Duchess Caroline, eldest daughter of the emperor Francis I. of Austria, and in 1833 to Maria, daughter of Maximilian I. of Bavaria. In 1830 a rising in Dresden led to his being named joint regent of the kingdom along with King Antony; and in this position his popularity and his wise and liberal reforms speedily quelled all discontent. On June 1, 1836, he succeeded his uncle on the throne. Though he administered the affairs of his kingdom with enlightened liberality, Saxony did not escape the political storms which broke upon Germany in 1848; and an insurrection in Dresden in May, 1849, compelled him to call in the help of Prussian troops. From that time, however, his reign was tranquil and prosperous. His death occurred accidentally through the upsetting of his carriage between Imst and Wenns, in Tyrol, 9th August, 1854. Frederick devoted his leisure hours chiefly to the study of botany. He made botanical excursions into different countries, and *Flora Marienbadensis, oder Pflanzen und Gebirgsarten gesammelt und beschrieben*, written by him in conjunction with Goethe, was published at Prague in 1837.

FREDERICK I. (1425–1476), elector palatine, surnamed the Victorious, second son of Elector Louis III., was born in 1425. He inherited a part of the palatinate on the death of his father in 1439, but delivered it up to his brother Louis IV. On the death of Louis in 1449, he became guardian of the infant heir Philip, and administrator of the kingdom. In 1452, on account of the threatening relation in which the neighboring princes stood to the palatinate, he resolved to assume the office of elector for life, on the understanding that his children should not hold the rank of princes, and that his nephew should be his successor. This led to a combination against him headed by the emperor Frederick III., but he managed to defend himself against all attacks, and in 1462 defeated at Seckenheim a combined army sent against him under the command of elector Albert Achilles of Brandenburg, after which he remained in undisturbed possession of his kingdom till his death, 12th December, 1476. Under him the palatinate received an addition of more than 60 fortresses and towns. Through his marriage with the daughter of a citizen of Augsburg he had two sons, the elder of whom, Frederick, adopted the ecclesiastical profession, and the younger, Louis, was the founder of the family of the princes and counts of Löwenstein.

See lives by Kremer, in 2 vols., Frankfort and Leipsic, 1765; and by Menzel, from 1454 to 1464, Munich, 1861.

FREDERICK II. (1482–1556), elector palatine, surnamed the Wise, fourth son of Philip the Noble-minded, was born in 1482, and succeeded his brother Louis as elector in 1544. During the siege of Vienna by Sultan Soliman II. in 1529, he held the command of the army of the empire. In 1535 he married Dorothea daughter of Christian II., ex-king of Denmark. Through the persuasion of Melanchthon he embraced the principles of the Reformation and joined the Smalkald League, but he afterwards signed the Augsburg Interim, and became reconciled with Charles V. He died in 1556.

FREDERICK III. (1515–1576), elector palatine, surnamed the Pious, eldest son of John II., palatine of Simmern, was born in 1515, succeeded his father in 1556, and became elector palatine on the death of Otto Henry in 1559. On his marriage in 1537 to the Lutheran princess Maria of Brandenburg-Baireuth, he adopted the Protestant faith, and in 1560 he replaced the Lutheran confession and worship by that of the Reformed or Calvinistic, on which account an unsuccessful attempt was made in 1566 by several of the Lutheran princes to obtain an imperial edict against him. He died 26th October, 1576.

See Kluckhohn, *Friedrich der Fromme*, Nördlingen, 1878. Two volumes of his letters were previously edited by Kluckhohn.

FREDERICK IV. (1574–1610), elector palatine, surnamed the Upright, son of Elector Louis VI and of Elizabeth of Hesse, was born in 1574, succeeded his father under the guardianship of his uncle John Casimir in 1583, and after the death of the latter in 1592 ruled as independent governor. His reign is chiefly of importance for the steadfast and firm support he rendered to the Protestant cause. Under his auspices the Protestant union of Germany was formed in 1601. Mannheim, which had greatly increased through the influx of Protestant refugees, was raised by him to the rank of a town. He died in 1610

FREDERICK V. (1596–1632), elector palatine and king of Bohemia, son of Frederick IV. and of Louisa Julia, daughter of William of Orange, was born in Amberg in 1596, and succeeded his father in 1610, under the guardianship of Duke John of Deux-Ponts. In 1613 he married Elizabeth, daughter of James I. of England; and on undertaking the government of his palatinate two years afterwards, he became the head of the Protestant union of German princes, on which account, and because of his connection with England, he was in 1619 chosen king of Bohemia. He shrank from this difficult position, but at last accepted it, partly owing to his wife's influence, but mainly in deference to the entreaties of a number of landless princes who had great power over him. When his forces were confronted at Prague, November 8, 1620, by those of the emperor under Tilly, his courage so utterly forsook him that he fled in panic from the field before the battle had commenced, and ignominiously took refuge in Holland from the dangers and difficulties of his position—the general ridicule with which he was regarded being indicated by dubbing him with the title "Winter-King." The remainder of his life was spent in vain endeavors to enlist the help of various European sovereigns to enable him to wrest his palatinate from Duke Maximilian of Bavaria, who had been invested with its sovereignty by the emperor. Frederick died at Mainz, November 19, 1632.

FREDERICK CITY, the capital of Frederick county, Maryland, U. S., is situated on Carroll's Creek, a tributary of the Monocacy, 45 miles N.W. of Washington. It is well and regularly built, and most of its houses are of brick or stone. It has a considerable agricultural trade, and its industries include iron, wood, leather, paper, and the preserving of fruit and vegetables. Among its educational institutions are the college established by the State in 1797, the female seminary, the academy connected with the convent of the Visitation nuns, and the deaf and dumb institution. During the civil war the city was occupied on different occasions by the opposing armies. The population of Frederick in 1860 was 8142, and in 1900, 9,296, of whom 1822 were colored.

FREDERICKSBURG, a city of Spottsylvania county, Virginia, U. S., on the S.W. side of the Rappahannock river, 110 miles above its mouth in Chesapeake Bay, and 61 miles N. of Richmond. The river, which is tidal up to this point, is here closed by a dam 900 feet long. It supplies motive-power for flour and other mills, and affords facilities for transportation of grain, marble, and freestone. Near the city is an unfinished monument, begun in 1833, over the grave of the mother of Washington. At Fredericksburg the Federal troops sustained a repulse by the Confederate forces, December 13, 1862. The population in 1860 was 5022, and in 1900, 5,068 of whom 1331 were colored.

FREDERICKSHALD, or FREDERICKSHALL, a maritime town of Norway, stift of Christiania, at the junction of the Iddefjord with the Tistedals, 57 miles S.S.E. of Christiania. It has an excellent harbor, and considerable trade in tobacco, sugar, iron, and wood. A regular line of steamers connects it with Christiania. Frederickshald is noted for its strong castle of Fredericksteen, which stands on a perpendicular rock 350 feet high overhanging the sea, and is considered one of the strongest fortresses in Europe. It was at the siege of this fortress that Charles XII., king of Sweden, was killed on 11th December, 1718. The town itself is not walled. Its old name was Halden, and it

received the addition of Frederick from Frederick III. of Denmark and Norway after its successful defence against the Swedes in 1665. It was almost totally destroyed by fire in 1759, and has since been rebuilt in a neat and regular manner. The castle surrendered to the Swedish crown-prince Bernadotte in 1814, and its capture was speedily followed by the conquest of the kingdom and its union with Sweden. The population in 1875 was 9956.

FREDERICKSTAD, a fortified town of Norway, stift of Christiania, is situated at the mouth of the Glommen, 48 miles S.E. of Christiania. The principal buildings are the church, the town-hall, the arsenal, and the magazine. It has manufactures of hardware, pottery, and brandy, and a considerable shipping trade and commerce in wood. About a mile and a half distant is the fall of the Glommen known as Sarpfos. Frederickstad was founded by Frederick II. in 1567. It was for a long time strongly fortified, and in 1716 Charles XII. of Sweden made a vain attempt to capture it. The population in 1900 was 14,573.

FREDERICTON, a city and port of entry of New Brunswick, Canada, capital of the province, is situated on the St. John river, 88 miles from its mouth. It stands on a plain bounded on one side by the river, which is here three-fourths of a mile broad, and on the other by a range of hills which almost encircle the town. It is regularly built with long and straight streets, and contains some handsome public buildings, among which are the province hall, the government house, the county court-house, the cathedral church, the university, and several other educational establishments. Fredericton is the principal commercial entrepôt with the interior of the province, and has also a large trade in lumber. The river is navigable for large steamers up to the city, and above it transport is effected in vessels of lighter draughts. A steam-ferry across the river connects the city with the town of St. Mary. Fredericton was incorporated in 1849. Population in 1852, 4458, and in 1901, 8,500.

FREE CHURCH OF SCOTLAND, The, is the name of a well-known ecclesiastical organization which includes a considerable proportion of the inhabitants of Scotland. In one sense the Free Church dates its existence from the Disruption of 1843, in another it claims to be the rightful representative of the National Church of Scotland as it was reformed in 1560.[1] In order to indicate the nature of the grounds on which this claim is made, it will be necessary briefly to point out how the leading facts of the ecclesiastical history of Scotland during the last 320 years are accentuated and construed by those who read them in a Free Church sense.

In that history the Free Churchman sees three great reforming periods. In his view these deserve to be called reforming on many accounts, but most especially because in them the independence of the church, her inherent scriptural right to exercise a spiritual jurisdiction in which she is responsible to her Divine Head alone, was both earnestly asserted and practically maintained. The first reformation extended from 1560, when the church freely held her first General Assembly, and of her own authority acted on the First Book of Discipline, to 1592, when her Presbyterian order was finally and fully ratified by the parliament. The second period began in 1638, when after 20 years of suspended animation, the Assembly once more shook off Episcopacy, and terminated in 1649, when the parliament of Scotland confirmed the church in her liberties in a larger and ampler sense than before. The third period began in 1834, when the Assembly made use of what the church believed to be her rights in passing the Veto and Chapel Acts. It culminated in the Disruption of 1843.

The fact that the church, as led first by Knox and afterwards by Melville, claimed an inherent right to exercise a spiritual jurisdiction is notorious. More apt to be overlooked is the comparative freedom with which that right was actually used by the church irrespective of state recognition. That recognition was not given until after the queen's resignation in 1567;[2] but, for several years before it came, the church had been holding her Assemblies and settling all questions of discipline, worship, and administration as they arose, in accordance with the first book of polity or discipline, which had been drawn up in 1560. Further, in 1581 she, of her own motion, adopted a second book of a similar character, in which she expressly claimed an independent and exclusive jurisdiction or power in all matters ecclesiastical, "which flows directly from God and the Mediator Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ the only king and governor of his church;" and this claim, though directly negatived in 1584 by the "Black Acts," which included an Act of Supremacy over estates spiritual and temporal, continued to be asserted by the Assemblies, until at last it also was practically allowed in the Act of 1592.[3] This legislation of 1592, however, did not long remain in force. An Act of Parliament in 1606, which "reponed, restored, and reintegrated" the estate of bishops to their ancient dignities, prerogatives, and privileges, was followed by several Acts of various subservient assemblies, which, culminating in that of 1618, practically amounted to a complete surrender of jurisdiction by the church itself. For twenty years no Assemblies whatever were held. This interval must necessarily be regarded from the Presbyterian point of view as having been one of very deep depression. But a second reformation, characterized by great energy and vigor, began in 1638. The proceedings of the Assembly of that year, afterwards tardily and reluctantly acquiesced in by the state, finally issued in the Acts of Parliament of 1649, by which the Westminster standards were ratified, lay-patronage was abolished, and the coronation oath itself framed in accordance with the principles of Presbyterian church government. Another period of intense reaction soon set in. No Assemblies were permitted by Cromwell after 1653; and, soon after the Restoration, Presbytery was temporarily overthrown by a series of rescissory Acts. Nor was the Revolution Settlement of 1690 so entirely favorable to the freedom of the church as the legislation of 1649 had been. Prelacy was abolished, and various obnoxious statutes were repealed, but the Acts rescissory were not cancelled; presbyterianism was re-established, but the statutory recognition of the Confession of Faith took no notice of certain qualifications under which that document had originally been approved by the Assembly of 1647;[4] the old rights of patrons were again discontinued, but the large powers which had been conferred on congregations by the Act of 1649 were not wholly restored. Nevertheless the great principle of a distinct ecclesiastical jurisdiction, embodied in the Confession of Faith, was accepted without reservation, and a Presbyterian polity effectively confirmed both then and at the ratification of the treaty of Union. This settlement, however, did not long subsist unimpaired. In 1712 the Act of Queen Anne, restoring patronage to its ancient footing, was passed in spite of the earnest remonstrances of the Scottish people. For many years afterwards (until 1784) the Assembly continued to instruct each succeeding commission to make application to the king and the parliament for redress of the grievance. But meanwhile a new phase of Scottish ecclesiastical politics commonly known as Moderatism had been inaugurated, during the prevalence of which the church became even more indifferent than the lay patrons themselves to the rights of her congregations with regard to the "calling" of ministers. From the Free Church point of view, the period from which the secessions under Erskine and Gillespie are dated was also characterized by numerous other abuses on the Church's part which amounted to a practical surrender of the most important and distinctive principles of her ancient Presbyterian polity.[5] Towards the beginning of the present century there were many circumstances, both within and without the church, which conspired to bring about an evangelical and popular reaction against this reign of "Moderatism." The result was a protracted struggle, which is commonly referred to as the Ten Years' Conflict, and which has been aptly described as the last battle in the long war which for

[1] "It is her being free, not her being established, that constitutes the real historical and hereditary identity of the Reformed National Church of Scotland." See *Act and Declaration*, etc., of Free Assembly, 1851.

[2] In the Act *Anent the true and holy Kirk, and of those that are declared not to be of the same.* This Act was supplemented by that of 1579, *Anent the Jurisdiction of the Kirk.*

[3] The Second Book of Discipline was not formally recognized in that Act; but all former Acts against "the jurisdiction and discipline of the true Kirk as the same is used and exercised within the realm" were abolished; and all "liberties, privileges, immunities, and freedoms whatsoever" previously granted were ratified and approved.

[4] The most important of these had reference to the full right of a constituted church to the enjoyment of an absolutely unrestricted freedom in convening Assemblies. This very point on one occasion at least threatened to be the cause of serious misunderstandings between William and the people of Scotland. The difficulties were happily smoothed, however, by the wisdom and tact of Carstares.

[5] See *Act and Declaration* of Free Assembly, 1851.

nearly 300 years had been waged within the church itself, between the friends and the foes of the doctrine of an exclusive ecclesiastical jurisdiction. That final struggle may be said to have begun with the passing in 1834 of the "Veto" Act, by which it was declared to be a fundamental law of the church that no pastor should be intruded on a congregation contrary to the will of the people,[1] and by which it was provided that the simple dissent of a majority of heads of families in a parish should be enough to warrant a presbytery in rejecting a presentee. The question of the legality of this measure soon came to be tried in the civil courts; and it was ultimately answered in a sense unfavorable to the church by the decision (1838) of the Court of Session in the Auchterarder case, to the effect that a presbytery had no right to reject a presentee simply because the parishioners protested against his settlement, but was bound to disregard the veto (see CHALMERS, vol. v. pp. 326, 327). This decision elicited from the Assembly of that year a new declaration of the doctrine of the spiritual independence of the church. The "exclusive jurisdiction of the civil courts in regard to the civil rights and emoluments secured by law to the church and the ministers thereof" was acknowledged without qualification; and continued implicit obedience to their decisions with reference to these rights and emoluments was pledged. At the same time it was insisted on "that, as is declared in the Confession of Faith of this National Established Church, 'the Lord Jesus Christ, as King and Head of the church, hath therein appointed a government in the hand of church officers distinct from the civil magistrate;' and that in all matters touching the doctrine, discipline, and government of the church her judicatories possess an exclusive jurisdiction, founded on the Word of God, which power ecclesiastical" (in the words of the Second Book of Discipline) "flows immediately from God and the Mediator the Lord Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ, the only spiritual King and Governor of His Kirk." And it was resolved to assert, and at all hazards defend, this spiritual jurisdiction, and firmly to enforce obedience to the same upon the office-bearers and members of the church. The decision of the Court of Session having been confirmed by the House of Lords early in 1839, it was decided in the Assembly of that year that the church, while acquiescing in the loss of the temporalities at Auchterarder, should reaffirm the principle of non-intrusion as an integral part of the constitution of the Reformed Church of Scotland, and that a committee should be appointed to confer with the Government with a view to the prevention, if possible, of any further collision between the civil and ecclesiastical authorities. While the conference with the Government had no better result than an unsuccessful attempt at compromise by means of Lord Aberdeen's Bill, which embodied the principle of a dissent with reasons, still graver complications were arising out of the Marnoch and other cases, the nature of which has been briefly indicated in vol. v. as above.[2] In the circumstances it was resolved by the Assembly of 1842 to transmit to the Queen, by the hands of the lord high commissioner, a "claim, declaration and protest," complaining of the encroachments of the Court of Session,[3] and also an address praying for the abolition of patronage. The home secretary's answer (received in January, 1843) gave no hope of redress. Meanwhile the position of the evangelical party had been further hampered by the decision of the Court of Session declaring the ministers of chapels of ease to be unqualified to sit in any church court. A final appeal to parliament by petition was made in March, 1843, when, by a majority of 135 (211 against 76), the House of Commons declined to attempt any redress of the grievances of the Scottish Church.[4] At the first session of the following General Assembly (18th May, 1843) the reply of the non-intrusion party was made in a protest, signed by upwards of 200 commissioners, to the effect that since, in their opinion, the recent decisions of the civil courts, and the still more recent sanction of these decisions by the legislature, had made it impossible at that time to hold a free Assembly of the church as by law established, they therefore "protest that it shall be lawful for us and such other commissioners as may concur with us to withdraw to a separate place of meeting, for the purpose of taking steps for ourselves and all who adhere to us—maintaining with us the Confession of Faith and standards of the Church of Scotland as heretofore understood—for separating in an orderly way from the Establishment, and thereupon adopting such measures as may be competent to us, in humble dependence on God's grace and the aid of His Holy Spirit, for the advancement of His glory, the extension of the gospel of our Lord and Saviour, and the administration of the affairs of Christ's house according to His holy word." The reading of this document was followed by the withdrawal of the entire non-intrusion party to another place of meeting, where the first Assembly of the Free Church was constituted, with Dr. Thomas Chalmers as moderator. This Assembly sat from the 18th to the 30th of May, and transacted a large amount of important business. On Tuesday the 23d, 396[5] ministers and professors publicly adhibited their names to the Act of Separation and Deed of Demission by which they renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant, and consenting to their being dealt with as such. By this impressive proceeding, the signatories voluntarily surrendered an annual income amounting to fully £100,000.

The first care of the voluntarily disestablished church was to provide incomes for her clergy and places of worship for her people. As early as 1841 indeed the leading principle of a "sustentation fund" for the support of the ministry had been announced by Dr. Candlish; and at "Convocation," a private unofficial meeting of the members of the evangelical or non-intrusion party held in November, 1842, Dr. Chalmers was prepared with a carefully matured scheme according to which "each congregation should do its part in sustaining the whole, and the whole should sustain each congregation." Between November, 1842, and May, 1843, 647 associations had been formed; and at the first Assembly it was announced that upwards of £17,000 had already been contributed. At the close of the first financial year (1843–44) it was reported that the fund had exceeded £61,000. It was participated in by 583 ministers; and 470 drew the full equal dividend of £105. Each successive year showed a steady increase in the gross amount of the fund; but owing to an almost equally rapid increase of the number of new ministerial charges participating in its benefits, the stipend payable to each minister did not for many years reach the sum of £150 which had been aimed at as a minimum. Thus in 1844–45 the fund had risen to £76,180, but the ministers had also increased to 627, and the equal dividend therefore was only £122. During the first ten years the annual income averaged £84,057; during the next decade £108,643; and during the third £130,246. The minimum

[1] This principle had been asserted even by an Assembly so late as that of 1736, and had been invariably presupposed in the "call," which had never ceased to be regarded as an indispensable prerequisite for the settlement of a minister.

[2] According to the Free Church "Protest" of 1843 it was in these cases decided (1) that the courts of the church were liable to be compelled to intrude ministers on reclaiming congregations; (2) that the civil courts had power to interfere with and interdict the preaching of the gospel and administration of ordinances as authorized and enjoined by the church; (3) that the civil courts had power to suspend spiritual censures pronounced by the courts of the church, and to interdict their execution as to spiritual effects, functions, and privileges; (4) that deposed ministers, and probationers deprived of their license, could be restored by the mandate of the civil courts to the spiritual office and status of which the church courts had deprived them; (5) that the right of membership in ecclesiastical courts could be determined by the civil courts; (6) that the civil courts had power to supersede the majority of a church court of the Establishment in regard to the exercise of its spiritual functions as a church court, and to authorize the minority to exercise the said functions in opposition to the court itself and to the superior judicatories of the church; (7) that processes of ecclesiastical discipline could be arrested by the civil courts; and (8) that without the sanction of the civil courts no increased provision could be made for the spiritual care of a parish, although such provision left all civil rights and patrimonial interests untouched.

[3] The narrative and argument of this elaborate and able document cannot be reproduced here. In substance it is a claim "as of right" on behalf of the church and of the nation and people of Scotland that the church shall freely possess and enjoy her liberties, government, discipline, rights, and privileges according to law, and that she shall be protected therein from the foresaid unconstitutional and illegal encroachments of the said Court of Session, and her people secured in their Christian and constitutional rights and liberties. This claim is followed by the "declaration" that the Assembly cannot intrude ministers on reclaiming congregations, or carry on the government of Christ's church subject to the coercion of the Court of Session; and by the "protest" that all Acts of the Parliament of Great Britain passed without the consent of the Scottish church and nation, in alteration or derogation of the government, discipline, rights, and privileges of the church, as also all sentences of courts in contravention of said government, discipline, rights, and privileges, "are and shall be in themselves void and null, and of no legal force or effect."

[4] The Scottish members voted with the minority in the proportion of 25 to 12.

[5] The number ultimately rose to 474.

of £150 was reached at last in 1868; and since then the balance remaining after that minimum has been provided has been treated as a surplus fund, and distributed among those ministers whose congregations have contributed at certain specified rates per member. In 1878 the total amount received for this fund was upwards of £177,000; in this 1075 ministers participated. The full equal dividend of £157 was paid to 766 ministers; and additional grants of £36 and £18 were paid out of the surplus fund to 632 and 129 ministers respectively.[1]

To provide for the erection of the buildings which, it was foreseen, would be necessary, a general building fund, in which all should share alike, was also organized, and local building funds were as far as possible established in each parish, with the result that at the first Assembly a sum of £104,776 was reported as already available. By May, 1844, a further sum of £123,060 had been collected, and 470 churches were reported as completed or nearly so. In the following year £131,737 was raised, and 60 additional churches were built. At the end of four years considerably more than 700 churches had been provided.

During the winter session 1843–44 the divinity students who had joined the Free Church continued their studies under Dr. Chalmers and Dr. Welsh; and at the Assembly of 1844 arrangements were made for the erection of suitable collegiate buildings. The New College, Edinburgh, was built in 1847 at a cost of £46,506; and divinity halls have subsequently been set up also in Glasgow and Aberdeen. In 1878 there were 13 professors of theology, with an aggregate of 230 students,—the numbers at Edinburgh, Glasgow, and Aberdeen respectively being 129, 69, and 32.

A somewhat unforeseen result of the Disruption was the necessity for a duplicate system of elementary schools. At the 1843 Assembly it was for the first time announced by Dr. Welsh that "schools to a certain extent must be opened to afford a suitable sphere of occupation for parochial and still more for private teachers of schools, who are threatened with deprivation of their present office on account of their opinions upon the church question." The suggestion was taken up with very great energy, and with the result that in May, 1845, 280 schools had been set up, while in May, 1847, this number had risen to 513, with an attendance of upwards of 44,000 scholars. In 1869 it was stated in an authoritative document laid before members of parliament that at that time there were connected with and supported by the Free Church 598 schools (including two normal schools), with 633 teachers and 64,115 scholars. The school buildings had been erected at a cost of £220,000, of which the committee of privy council had contributed £35,000, while the remainder had been raised by voluntary effort. Annual payments made to teachers, etc., as at 1869, amounted to £16,000. The total sum expended by the Free Church since the Disruption, for educational purposes, has been not less than £600,000. In accordance with certain provisions of the Education Act of 1872 most of the schools of the Free Church were voluntarily transferred, without compensation, to the local school boards.

It has been already seen that during the period of the Ten Years' Conflict the non-intrusion party strenuously denied that in any one respect it was departing from acknowledged principles of the National Church. It continued to do so after the Disruption. In 1846, however, it was found to have become necessary, "in consequence of the late change in the outward condition of the church," to amend the "questions and formula" to be used at the licensing of probationers and the ordination of office-bearers. These were amended accordingly; and at the same time it was declared that, "while the church firmly maintains the same scriptural principles as to the duties of nations and their rulers in reference to true religion and the Church of Christ for which she has hitherto contended, she disclaims intolerant or persecuting principles, and does not regard her Confession of Faith, or any portion thereof when fairly interpreted, as favoring intolerance or persecution, or consider that her office-bearers by subscribing it profess any principles inconsistent with liberty of conscience and the right of private judgment." The main difference between the "formula" of the Free Church and that of the Established Church is that the former refers to the Confession of Faith simply as "approven by General Assemblies of this Church," while the latter describes it as "approven by the General Assemblies of this National Church, and ratified by law in the year 1690, and frequently confirmed by divers Acts of Parliament since that time." The former inserts an additional clause,—"I also approve of the general principles respecting the jurisdiction of the church, and her subjection to Christ as her only Head, which are contained in the Claim of Right and in the Protest referred to in the questions already put to me;" and also adds the words which are here distinguished by italics,—"And I promise that through the grace of God I shall firmly and constantly adhere to the same, and to the utmost of my power shall in my station assert, maintain, and defend the said doctrine, worship, discipline, and government of this church by kirk-sessions, presbyteries, provincial synods, and general assemblies, *together with the liberty and exclusive jurisdiction thereof*, and that I shall, in my practice, conform myself to the said worship and submit to the said discipline [and] government, *and exclusive jurisdiction*, and not endeavor directly or indirectly the prejudice or subversion of the same."[2] In the year 1851 an Act and Declaration anent the publication of the subordinate standards and other authoritative documents of the Free Church of Scotland was passed, in which the historical fact is recalled that the Church of Scotland had formally consented to adopt the Confession of Faith, catechisms, directory of public worship, and form of church government agreed upon by the Westminster Assembly; and it is declared that "these several formularies, as ratified, with certain explanations, by divers Acts of Assembly in the years 1645, 1646, and particularly in 1647, this church continues till this day to acknowledge as her subordinate standards of doctrine, worship, and government."[3]

In 1858 circumstances arose which, in the opinion of many, seemed fitted to demonstrate to the Free Church that her freedom was an illusion, and that all her sacrifices had been made in vain. Mr. John Macmillan, minister of Cardross, accused of immorality, had been tried and found guilty by the Free Presbytery of Dumbarton. Appeal having been taken to the synod, an attempt was there made to revive one particular charge, of which he had been finally acquitted by the presbytery; and this attempt was successful in the General Assembly. That ultimate court of review did not confine itself to the points appealed, but went into the merits of the whole case as it had originally come before the presbytery. The result was a sentence of suspension. Mr. Macmillan, believing that the Assembly had acted with some irregularity, applied to the Court of Session for an interdict against the execution of that sentence; and for this act he was summoned to the bar of the Assembly to say whether or not it was the case that he had thus appealed. Having answered in the affirmative, he was deposed on the spot. Forthwith he raised a new action (his previous application for an interdict had been refused) concluding for reduction of the spiritual sentence of deposition, and for substantial damages. The defences lodged by the Free Church were to the effect that the civil courts had no right to review and reduce spiritual sentences, or to decide whether the General Assembly of the Free Church had acted irregularly or not. Judgments adverse to the defenders were delivered on these points; and appeals were taken to the House of Lords. But before the case could be heard there, the lord president took an opportunity in the Court of Session to point out to the pursuer that, inasmuch as the particular General Assembly against which the action was brought had ceased to exist, it could not therefore be made in any circumstances to pay damages, and that the action of reduction of the spiritual sentence, being only auxiliary to the claim of damages, ought therefore to be dismissed. He further pointed out that Mr. Macmillan might obtain redress in another way, should he be able to prove malice against individuals. Very soon after this deliverance of the lord president, the case as it had stood against the Free Church was withdrawn, and Mr. Macmillan gave notice of an action of a wholly different kind. But this last was not persevered in. The appeals which had been taken to the House of Lords were, in these circumstances, also departed

[1] Congregations, it ought to be noted, are permitted, and indeed expected, by collections or otherwise, each to "supplement" the income which its pastor derives from the general sustentation fund.

[2] It may be added that, while the Free Church requires elders to subscribe the same formula as ministers, the Established Church requires them to sign an older and shorter one.

[3] By this formal recognition of the qualifications to the Confession of Faith made in 1647 the scruples of the majority of the Associate Synod of Original Seceders were removed, and 27 ministers, along with a considerable number of their people, joined the Free Church in the following year.

from by the Free Church. It is perhaps to be regretted, from the legal point of view, that the case did not advance sufficiently to show how far the courts of law would be prepared to go in the direction of recognizing voluntary tribunals and a kind of secondary exclusive jurisdiction founded on contract.[1] But, whether recognized or not, the church for her part continued to believe that she had an inherent spiritual jurisdiction, and remained unmoved in her determination to act in accordance with that resolution "notwithstanding of whatsoever trouble or persecution may arise."[2]

In 1863 a motion was made and unanimously carried in the Free Church Assembly for the appointment of a committee to confer with a corresponding committee of the United Presbyterian Synod, and with the representatives of such other disestablished churches as might be willing to meet and deliberate with a view to an incorporating union. Formal negotiations between the representatives of these two churches were begun shortly afterwards, which resulted in a report laid before the following Assembly. From this document it appeared that the committees of the two churches were not at one on the question as to the relation of the civil magistrate to the church. While on the part of the Free Church it was maintained that he "may lawfully acknowledge, as being in accordance with the Word of God, the creed and jurisdiction of the church," and that "it is his duty, when necessary and expedient, to employ the national resources in aid of the church, provided always that in doing so, while reserving to himself full control over the temporalities which are his own gift, he abstain from all authoritative interference in the internal government of the church," it was declared by the committee of the United Presbyterian Church that, "inasmuch as the civil magistrate has no authority in spiritual things, and as the employment of force in such matters is opposed to the spirit and precepts of Christianity, it is not within his province to legislate as to what is true in religion, to prescribe a creed or form of worship to his subjects, or to endow the church from national resources." In other words, while the Free Church maintained that in certain circumstances it was lawful and even incumbent on the magistrate to endow the church and on the church to accept his endowment, the United Presbyterians maintained that in no case was this lawful either for the one party or for the other. Thus in a very short time it had been made perfectly evident that a union between the two bodies, if accomplished at all, could only be brought about on the understanding that the question as to the lawfulness of state endowments should be an open one. The Free Church Assembly, by increasing majorities, manifested a readiness for union, even although unanimity had not been attained on that theoretical point. But there was a minority which did not sympathize in this readiness, and after ten years of fruitless effort it was in 1873 found to be expedient that the idea of union with the United Presbyterians should for the time be abandoned. Other negotiations, however, which had been entered upon with the Reformed Presbyterian Church at a somewhat later date proved more successful; and a majority of the ministers of that church with their congregations were united with the Free Church in 1876.

The total income of the Free Church for the year 1877–78 was £575,718. This included (1) sustentation fund, £177,659; (2) local building fund, £99,480; (3) missionary and educational, £91,895; (4) congregational and miscellaneous, £190,775. Since 1843 an aggregate amount of nearly £13,000,000 has been raised. In 1878 the number of congregations was 997, with a total membership of 270,000. 1075 ministers participated in the equal dividend. There were also 59 missionaries employed at 21 principal mission-stations in India, Africa, Syria, and Polynesia.

Literature.—An authorized edition of the *Subordinate Standards* of the Free Church, including the *Claim of Right* and *Protest*, was published in 1851 in an easily accessible form, along with the *Act and Declaration* of that year. Of these "standards" (the Holy Scriptures being held supreme as the "rule of faith and manners") the most important is the *Confession of Faith*, which alone is imposed by subscription. The *Catechisms* (*Larger* and *Shorter*) are "sanctioned as directories for catechising;" and the *Directory for Public Worship*, the *Form of Church Government*, and the *Directory for Family Worship* are "of the nature of regulations rather than of tests." A practical application of the doctrine of the *Confession*, called the *Sum of Saving Knowledge*, is also included among the "standards." The general subject of Scottish church history is handled in a considerable number of well-known works, which need not be enumerated here. Among books professedly dealing with the Free Church question, the most valuable are Sydow's *Die Schottische Kirchenfrage* (Potsdam, 1845), and *The Scottish Church Question* (London, 1845); Buchanan's *Ten Years' Conflict* (1849); Hanna's *Life of Chalmers* (1852); and Taylor Innes on *The Law of Creeds in Scotland* (1867). See also Cockburn, *Memorials of His Time* (Continuation, 1874); Walker, *Dr. Robert Buchanan: an Ecclesiastical Biography* (1877); *Annals of the Disruption* (published by authority of a committee of the Free Church, 1876–77). (J. S. BL.)

[1] See Taylor Innes, *Law of Creeds in Scotland*, p. 258 *seq.*

[2] The language of Dr. Buchanan, for example, in 1860 was (*mutatis mutandis*) the same as that which he had employed in 1838 in moving the Independence resolution already referred to.

FREEHOLD, in the English law of real property, is an estate in land, not being less than an estate for life. An estate for a term of years, no matter how long, was considered inferior in dignity to an estate for life, and unworthy of a freeman (see ESTATE). "Some time before the reign of Henry II., but apparently not so early as Domesday, the expression *liberum tenementum* was introduced to designate land held by a freeman by a free tenure. Thus freehold tenure is the sum of the rights and duties which constitute the relation of a free tenant to his lord."[3] In this sense freehold is distinguished from copyhold, which is a tenure having its origin in the relation of lord and villain (see COPYHOLD). Freehold is also distinguished from leasehold, which is an estate for a fixed number of years only. By analogy the interest of a person who holds an office for life is sometimes said to be a freehold interest. The term *customary freeholds* is applied to a kind of copyhold tenure in the north of England, viz., tenure by copy of court-roll, but not, as in other cases, expressed to be at the will of the lord.

FREE IMPERIAL CITIES is the ordinary English translation of *Freie Reichs-Städte*, a technical expression in German history. In Germany, as in other countries of Europe, a considerable number of towns succeeded, in the midst of the dynastic confusion of the Middle Ages, in maintaining or acquiring more or less complete independence of the state or sovereign within whose territory they were situated. This they effected partly by forming defensive leagues with each other, and partly by procuring, in return for service or money, privileges and protection from the successive occupants of the imperial throne. Of these free towns a certain proportion rose by commerce and industry to a position of great influence, and ultimately took rank along with kingdoms and principalities as integral members of the body politic of the empire. They first appear distinctly in this character in the reign of Henry VII. (1308–1313). Their number was continually fluctuating, for their liberties were almost as easily lost as they were with difficulty acquired. Most of them had to maintain a continual conflict by war or diplomacy with the ecclesiastical or secular potentates of their district, and not unfrequently their interests were betrayed by the emperors themselves. Mainz, which in the 13th century was at the head of the *Rheinisches Städtebund*, or confederation of the cities of the Rhine, was conquered in 1462, and subjected to the bishop's see; Zwickau, Altenburg, and Chemnitz, put in pawn first by Frederick II. and afterwards by several of the later emperors, thus fell into the hands of the dukes of Saxony; other free cities placed themselves of their own accord under the control of prince or bishop; some, as Donauworth, were deprived of their privileges by the emperors on account of real or alleged offences; others again were separated from the empire by foreign conquest, as Hainault or Hagenau, Colmar, Schlettstedt, Weissenburg, Landau, and Besançon by Louis XIV.; and Basel notably preferred to cast in its lot with the rising confederation of Switzerland. At the diet of Augsburg in 1474 the free imperial cities divided themselves for the first time into two benches, the Rhenish and the Swabian, the former also including those of Alsace, Wetterau, Thuringia, and Saxony, and the latter those of Franconia. They were formally constituted the third collegium of the diet by the peace of Westphalia in 1648. At the time of the French Revolution they still numbered 51,—the Rhenish bench comprising Cologne, Aix-la-Chapelle or Aachen, Lübeck, Worms, Spires, Frankfort-on-the-Main, Goslar, Bremen, Hamburg, Mühlhausen, Nordhausen, Dortmund, Friedberg, and Wetzlar; and the Swabian bench, Ratisbon or

Regensburg, Augsburg, Nuremberg, Ulm, Esslingen, Reutlingen, Nördlingen, Rothenburg on the Tauber, Schwäbisch-Hall, Rothweil, Ueberlingen, Heilbronn, Gmünd, Memmingen, Lindau, Dinkelsbühl, Biberach, Ravensburg, Schweinfurt, Kempten, Windsheim, Kaufbeuern, Weil, Wangen, Isny, Pfullendorf, Offenburg, Leutkirchen, Wimpfen, Weissenburg in the Nordgau, Giengen, Gengenbach, Zell on the Hammerbach, Buchhorn, Ahlen, Buchau, Bopfingen. A large proportion of these towns had then at least as little claim to their exceptional position as the pocket-burghs of England before the passing of the Reform Act. By the decision of the imperial deputation of 1803 (*Reichsdeputationshauptschluss*) Cologne, Aix-la-Chapelle, Worms, and Spires were assigned to France; only six, Hamburg, Lübeck, Bremen, Augsburg, Frankfort-on-the-Main, and Nuremberg were allowed to retain their *Reichsfreiheit*, or, in other words, to hold directly of the empire. On the dissolution of the empire in 1806, Augsburg and Nuremberg were given to Bavaria, and Frankfort was made the seat of Count Dahlberg, the archbishop and electoral prince of Mainz, who was appointed primate of the confederation of the Rhine. On the establishment of the German confederation in 1815, Hamburg, Lübeck, Bremen, and Frankfort were recognized as free cities, and the first three still hold that position in the new German empire; but Frankfort, in consequence of the part it took in the war of 1866, has been degraded to the rank of an ordinary Prussian town.

In the earlier centuries of their existence the free cities of the empire were under the jurisdiction of two imperial officers, one of whom, the imperial advocate or *Reichsvogt*, took charge of criminal cases, and the other, the imperial procurator or *Reichs-Schultheiss* or *Schuldheiss*, dealt with the civil cases. As time went on many of the cities purchased the right of filling these offices with members of the principality; and in several instances the imperial authority fell practically into desuetude except when it was roused into action by peculiar circumstances, such as a dispute between the citizens and their magistrates. The internal constitution of the cities was organized after no common type; but there were several of them whose privileges were drawn up in imitation of those of Cologne, which had been one of the very first to assert its independence.

Wendt, *Beschreibung der kaiserl. freien Reichsstädte*, Leipsic, 1804; G. W. Hugo, *Die Mediatisirung der deutschen Reichsstädte*, Carlsruhe, 1838; Waitz, *Deutsche Verfassungsgeschichte*.

FREEMASONRY (*Fr.* Franc-maçonnerie, *Ger.* Freimaurerei) is the name given to that system of ritual and rules which Freemasons observe. It may also be applied to the masonic art, or the practice of masonic ritual and rule. The institution is not older than the beginning of the 18th century, but it has been lately said to include more than 10,000 lodges and more than 1,000,000 members. Before considering the history and actual position of the modern society itself, however, a few words are due to the really interesting and much-debated question of its origin and antecedents. It is, of course, easy to point out vague analogies between Freemasonry and the great secret organizations having social aims, which existed in antiquity. The Pythagoreans, the Eleusinians, the Essenes, and the Carmathites and Fedavi (the mystic Rationalists of Islam) have all been appealed to by uncritical masonic writers in the hope of giving to their craft the doubtful authority and prestige of ancient descent. If the resemblances were more numerous and striking than they are, they would not prove an historical connection between organizations so widely removed from one another in time, and they would admit of explanation by the general doctrine of psychical identity, one of the most important results of anthropological science. Besides this, the superficial resemblances are accompanied by radical differences. The mere conception of Freemasonry implies cosmopolitan brotherhood, and was therefore impossible in the ancient world. If indeed the genuine legends of the craft were followed, its origin would be traced to the creation, the flood, or at least the building of Solomon's temple. Accordingly, one of the most popular and voluminous masonic writers of the 19th century, the Rev. George Oliver, informs the world that Moses was a grand master, Joshua his deputy, and Aholiab and Bezaleel grand wardens. Again, a likeness, sometimes real and sometimes fanciful, between the sets of symbols and ceremonies used has led many writers to see an organic connection between Freemasonry and the Assassins, the Rosicrucians, the Templars, the Illuminati, the Carbonari, and the Hetairia, and other social and political secret societies, old and young, of the most widely differing aims. It is possible that Freemasonry copied an older ritual, which was again imitated by younger societies, who also endeavored to utilize masonic lodges as stations for proselytizing work. But these facts themselves show discontinuity of life. The true historical precursors of the modern fraternity of Freemasons were the mediæval building corporations. Of these the most distinctive type is to be found in the stone masons (*Steinmetzen*) of Germany. It is a further and more difficult question what were the relations between these mediæval societies and the Roman collegia not struck at by the law *De Collegiis Illicitis*, D. 47, 22. Krause in his *Die drei ältesten Kunsturkunden der Freimaurerbrüderschaft*[1] points out that these collegia had an exchequer, an archive, patrons, religious ceremonies, an oath, a benefit and burial fund, and a register. They had such officers as magistri, decuriones, tabularii, censores, and they instructed their apprentices to a certain extent in secret. No doubt such *sodalitia* existed for centuries in Gaul and Britain, and they may have deposited in the civilization of these countries some of their ideas and habits. Again, at a later period, there was a distinct invitation sent from the West to the building corporations of Byzantium; the movement westward was increased by the iconoclasm of Leo. But the European building societies were undoubtedly distinct growths. The *cæmentarii* or *liberi muratores* at first grouped themselves round the monasteries, especially of the Benedictine order. The abbots were in many cases the architects who employed the masons on ecclesiastical buildings and repairs. As architecture developed, and with increasing wealth the church gradually undertook larger and nobler works, these societies of craftsmen also assumed a more definite and more durable form. The taste and science of Gothic architecture were to a large extent the possession of the *Bauhütten*, or wooden booths where the stone-cutters during the progress of the work kept their tools, worked, held their meetings, and probably also took their meals and slept. In the 12th century there are distinct traces of a general association of *Bauhütten* throughout Germany, acknowledging one set of *Ordnungen* or craft laws, one set of secret signs and ceremonies (*Heimlichkeiten*) and to a certain extent one central authority in the Haupthütte of Strasburg.[2] Albertus Magnus (1205–1280) is supposed to have introduced many of the Jewish and Arabian symbols which were popular in the craft. The privileges which a *Bauhütte* was able to give to its masters, parlierer (speakers), and journeymen, were chiefly "a share in the administration of justice, in the election of officers, in the banquets, and in works of charity." The trade customs and symbolic forms of these associations have been described by Fallou in his *Mysterien der Freimaurer* (1859), Winzer in his *Deutschen Brüderschaften des Mittelalters* (1859), and Fort, *Early History and Antiquities of Freemasonry* (Philadelphia, 1877). The initiation is said to be copied from a Benedictine consecration. Instruction was given to all apprentices in both architecture and its allegory. When he had served his time and finished his "Wanderjähre," every man was entitled, if of good character, to receive the *Wortzeichen* or *der Gruss*. He took the oath of secrecy on the Bible, the compass, and the square, and drank the *Willkommen*. The three great lights,[3] the hammer or gavel, the gold, azure, and white colors, the sacred numbers 3, 5, 7, and 9, and the interlaced cords, all had their traditional meaning. The obligation to secrecy, however, probably applied to the apprentice even before initiation. See the *Constitutions of Masonry* (Halliwell's edition, l. 279–282)—

> "The prevystye of the chamber telle he no mon,
> Ne yn the logge whatsever they done;

[1] See also Rebold, *Hist. Gén. de la Franc-maçonnerie*, 1851, of which there is an American translation by Brennan, Cincinnati, 1868.

[2] The importance of this was first pointed out in Abbé Grandidier's letter, which forms App. xvii. to De Luchet's *Essai sur la Secte des Illuminés*, Paris, 1789.

[3] These candles have been derived from the cabalistic triangle formed of the *Sephiræ*, splendors or attributes proceeding from the Yodh, the Eu-Soph, or central point of light (see Ginsburg *On the Cabala*). The masonic MS. attributed to Henry VI. refers to the faculty of Abrac, *i. e.*, of the adorable name worshipped by the Basilidian heretics.

Whatsever thou heryst, or syste hem do,
Tell hyt no mon, whersever thou go."

It has been observed by Brentano,[1] that the working arrangements of the building trades at this time differed when a cathedral or palace was being built, the architect being then master of the lodge with foremen under him; and when a dwelling-house was built, the owner then engaging both masters and workmen. There was thus a nearer approach to the modern factory system; and in fact the well-known English statutes against combinations, congregations, and chapters of workmen (34 Edw. III. c. 9, and 3 Hen. VI. c. 1) were directed against the excessive wages of journeymen. The separate interests of this class found expression in the contemporary French institution of Compagnonnage.[2] The atmosphere of these societies seems, even at an early date, to have been favorable to liberty of thought and religious toleration. Hence they were prohibited by the council of Avignon in 1326. The authority of the *Haupthütte* was recognized at the great assemblies of Ratisbon and Strasburg in 1459, the statutes of which received imperial confirmation. It was legally destroyed by an edict of 1731, long before which time its practical vitality had ceased. England imported much of her lodge organization and learning from Germany. The York charter, on which she based her claim to a native system in the time of Athelstan, is a much later document. This charter contains the famous legend of the craft which derives the seven liberal sciences (masonry being a part of geometry) from the family of Lamech. This science, preserved on a stone pillar from the flood, was taught by Euclid to the Egyptians, and carried by Israel to the building of the temple. Maymus Græcus brought it to Charles Martel and to England. The early history of the English mason lodges has been illustrated by the works of Wm. J. Hughan,—*Constitutions of the Freemasons*, *History of Freemasonry at York*, etc.[3] The first instance of a gentleman or amateur being "accepted" is that of the antiquary Elias Ashmole (afterwards Windsor Herald under Charles II.), who, along with Colonel Manwaring, was entered at Warrington in 1646. The causes which led to the introduction of a new class of members, and gradually converted operative into speculative masonry, are well stated by Findel, the learned editor of the German masonic journal *Die Bauhütte*, whose *History of Freemasonry* (translated into English in 1869) is by far the most scientific and complete work upon the subject. In the first place the old secrets of Gothic masonry were rendered less valuable by the spread of Augustan and Renaissance architecture, which Inigo Jones and his patron Lord Pembroke had been studying on the Continent. Jones was patron of the Freemasons from 1607 to 1618. He invited several Italian artists to join the body. Then the disorder of the civil wars prevented meetings and broke up the masonic connection. Again the growing spirit of the Reformation in religion gave men a freedom of speech which superseded the marks and caricatures in which the old masons exposed the vices of the church. Toleration was soon a political fact. Science, too, took a new departure from the time of Bacon. The interrogation of nature was preferred to legend and allegory. At the same time a perfectly distinct current of ideas was originated by the Arabian mysticism of Paracelsus and Rosenkreuz, which, after being popularized on the Continent by one of its most decided opponents, Valentine Andreæ, was preached to the people of England by Robert Fludd in his *Tractatus Theologico-Philosophicus*. Works like Bacon's *New Atlantis* and Depuy's "History of the Condemnation of the Templars" (in his *Traitez concernant l'Histoire de France*, 1651) fostered the idea of a new humanitarian society, and at the same time suggested the adoption of ancient symbols of fellowship. The same thing is seen in the *Pantheisticon* of Toland. It was under the impulse thus communicated that a general assembly of masons was held in 1663, at which the old catechisms were revised, and a series of new statutes passed. The reconstruction of London after the fire, the building of St. Paul's, and the patronage of Sir Christopher Wren, kept up the interest in the movement; and at last a formal resolution was passed that the masonic privileges should no longer be confined to operative masons.

England.—Modern or speculative masonry may be said to have begun in London on June 24, 1717, "the high noon of the year, the day of light and of roses," when the four London lodges, having erected themselves into a grand lodge, named their first grand master. The leading spirits in this revival were Desaguliers, the well-known popularizer of natural science, and James Anderson, a Scotch Presbyterian minister, who compiled the *Book of Constitutions*, containing the ancient regulations and charges of the craft. This book is quite uncritical. It is said that the mechanical tastes and the Huguenot principles of Desaguliers are both traceable in the subsequent organization of the society. From this time new lodges could be formed only by warrant from the grand lodge, but they were empowered to create masters and fellow crafts. In 1721 the duke of Montagu was elected grand warden. He was the first noble who obtained that office. In the strange society of Gormogones, subject to the "sub-œcumenical volgi" at Rome, it is supposed that the Jesuits made a final effort to secure English Freemasonry as a channel for their political influence. At this time, also, the committee of charity was formed, which has since raised and expended very large sums for the relief of distressed brethren, and built the boys' and girls' masonic schools at Battersea Rise and Tottenham. Provincial grand masters were appointed, and charters granted to many foreign lodges. In the latter part of the 18th century the ancient York Lodge, backed by several old masons who had been indulging in irregular initiations, put forward a rival claim to be grand lodge or supreme authority. This claim was rested on the fable of an assembly at York in the year 926. The York people had also a new ritual, described in the *Book of Laws or Ahiman Rezon*, and also in *Jachin and Boaz*, *The three distinct Knocks*, and *Hiram Adonham or the Grand Master Key*[4] (1762). On the orthodox or London side appeared the well-known *Illustrations of Masonry*, by Preston, the pupil of Ruddiman. The schismatics introduced the red color of the royal arch degree, which they represented as something more exalted than the blue degrees of St. John. It belongs to the order of Templars, the legend referring to the second building of the temple. Another branch of Templarism, the grand chapter of Harodim, was founded in London in 1787. Just at the end of the century the publication of Abbé Barruel's *Memoirs pour servir à l'histoire du Jacobinisme*, translated into English by Clifford (who applied his author's principles to the United Irishmen and other Corresponding Societies of the time) and of Professor Robinson's *Proofs of a Conspiracy*, translated into French and German, made Freemasonry the subject of considerable suspicion.[5] The Act of 1799 directed against seditious societies, however, makes an exception in favor of the masonic lodges, which, according to the Act, meet chiefly for benevolent purposes. In 1813 a union was at last brought about by the dukes of Sussex, Kent, and Athole between the rival grand lodges of London and York, henceforth known as the United Grand Lodge of England. This patronage of aristocratic blood gave an impetus to Freemasonry, and in 1832 Mr. Crucefix, the editor of the *Freemason's Quarterly Review*, succeeded in founding the Freemason's Asylum. The brotherhood showed their good sense in deciding about this time that Jews might become members of the craft. They also built a hall, established their archæological institute and "The London Literary Union," and started the *Freemason's Magazine* and the *Freemason*, in which periodicals a record may be found of the most recent masonic opinion and history. Besides 60 provincial grand lodges and 1200 lodges, England has a grand chapter for the royal arch degree, a grand lodge for the mark masters, a grand conclave of the knights templars, and a superior grand council of the ancient and accepted rite of the 33 degrees.

Ireland.—The first Irish lodge of speculative masonry seems to have been opened at Dublin in 1730. The English constitutions were adopted wholesale. Nothing of interest occurs in the Irish history. A characteristic liking is shown for the most sonorous of the high degrees:—the knights of the sword, the east, and the sun, the rosicrucian or mason prince, the kadosh or philosophical mason, and

[4] The Jewish legend of the assassination of and search for Hiram, which still appears in the business of a lodge, resembles the Scandinavian story of Baldur.
[5] The earliest book of this class was Abbé Larudan's *Franc-maçon Écrasé*, 1746.

the grand general inspector. Power to grant these degrees was absurdly enough obtained from "Mother Kilwinning," a Scotch lodge which has always laid claim to a fabulous antiquity. The disputes between the grand chapter and grand consistory of Dublin have been frequent and violent. Ireland has now 350 lodges. The grand lodge, which supports two orphan schools, has an income of about £4000. A statement of the Ultramontane argument in modern Ireland will be found in Gargano's *Irish and English Freemasons*, Dublin, 1878, which is largely founded on Mgr. Dupanloup's *Study of Freemasonry* and *Secret Warfare against Church and State*. Gargano strongly urges the injustice done by the secret preference given by masons to one another in the ordinary civil and commercial relations of life. His book also contains an explanation of the pass-grip and real-grip for the three ordinary degrees, and for the mark master, the royal arch, and the knight templar, and a minute description of the modern initiation, with the text of the oaths.

Scotland.—In Scotland the history of Freemasonry closely resembles what took place in England. Before the 16th century there is not much trace of special legislation about masons.[1] Like the other crafts they enjoyed, under the Act of 1424, the right of nominating their own deacon or master-man. The deacon gave place to the warden, who represented rather the public than the trade interest. In 1493 the masons and wrights are denounced as oppressors of the lieges, because they had agreed that "they sall have fee alswcill for the haile day as for the wark day," and "that quair ony begiennis ane mannis warke ane uther sall not end it." A severe blow was struck against their privileges by an Act of 1540, which rendered legal the employment of unfreemen builders, but Queen Mary restored the jurisdiction from the trade visitors to the deacons, and confirmed their ancient right of self-regulation. In 1598–99 we have the celebrated statutes and ordinances to be observed "by all master masons, set down by William Shaw, master of work to his majesty, and general warden of the craft." These documents, one of which was preserved in the charter chest of the Eglinton family, are printed in Mr. Murray Lyon's learned *History of Freemasonry in Scotland*, Edin., 1873. They are confined to trade regulation, and do not deal with benefits. They fix the number of apprentices, the examination on entrance, the subscription to the box, the election of officers, provision for the safety of craftsmen, etc. The "Old Buik" of the Kilwinning Lodge was not really a Scotch document. It was a version of the English masonic legend and charges. The ceremony of initiation was at this time very simple; but the speaking plack, the dinner, and the pitcher of ale were exacted. The system of degrees was not developed. There was probably a pass-word, such as the squaremen word used in the "brithering" of the wrights and slaters. The individual "marks" chosen by entrants were carefully registered, but they did not indicate status. The mark degree, revived in 1869, and made the subject of a conference in 1871, was not known before 1789. In fact, the apprentices were originally present at and concurred in most of the business of the lodge. This word "lodge" occurs for the first time in a "statute anent the government of the master mason of the College Kirk of St. Giles," 1491, which is to be found in the burgh records of Edinburgh. It would appear that the deacon of the civil trade incorporation was often *ex officio* head of the lodge. The quartermaster and the intender or instructor were also officers in the old lodge. *Cowans, i.e.*, strangers, were stringently provided for in Shaw's *Statutes*. The traces of female membership are explained by the custom of the widows and daughters of freemen being admitted, at least to finish the contracts of the deceased. The Hay MSS. in the Advocates' Library contain two charters or letters of jurisdiction, dated in 1601 and 1628, by the freemen masons and hammermen in favor of the St. Clairs of Rosslyn, in virtue of which the head of that family for a long time acted as the patron, protector, and judge of the early masonic lodges. This has sometimes been inaccurately represented as a heritable conveyance of a grand mastership. As in England, there are traces of amateurs or non-operative members being gradually admitted to full privileges even in the 17th century, though such persons were charged higher entrance fees. This was called the theoric or geomatic as opposed to the domatic or operative element. Boswell of Auchinleck was a member so early as 1600. The first years of the 18th century were marked by movements of insubordination among the journeymen, who considered themselves entitled to a larger share of control over the common purse. The original theory of the lodge was that only masters, and not fellowcrafts or apprentices, were members. In 1721 the enthusiastic Desaguliers appeared in Edinburgh; and on November 30, 1736, the first general assembly of symbolical masons was held, and a grand lodge for Scotland formed. The representative of the St. Clair family then resigned his hereditary office and was elected first grand master. St. Andrew's day was substituted for the day of St. John the Baptist. Provincial grand masters were soon added, and there was a general adhesion of Scotch lodges to the new organization. The subsequent history of the brotherhood is not eventful. In Scotland they have been more remarkable for conviviality, or "refreshment," as it is technically called, than for comprehensive charity. Their gloves, aprons, sashes, and jewels are well known in festival or funeral processions. Their political relations have been peaceful. In 1757 the Associate Synod excommunicated all persons taking the secret oath, but this was only a part of the general defiance which Cameronianism gives to civil duty. In 1800, when intercourse with some Irish regiments had introduced the templar degrees to some of the Ayrshire lodges, an attempt was made by the law officers of the crown to convict certain templars at Maybole of sedition and the administration of unlawful oaths. The case only resulted in the disclosure of the extremely absurd ceremonies connected with the two degrees of this royal order, viz., Heredom of Kilwinning and Rosy Cross. One of them consisted in drinking porter out of a human skull. Again, when political feeling ran high at the beginning of the present century, the authority of the grand lodge was seriously shaken by the revolt of the associated lodges headed by Canongate Kilwinning. The Court of Session, Lawson *v.* Gordon, July 7, 1810, F. C., refused to recognize a masonic lodge as a corporation, and in another case they rejected the argument that lodges certified by the grand lodge were alone entitled to the protection of the excepting clause in the Act of 1799. The quarrel was speedily arranged. In 1811 a supreme grand royal arch chapter of Scotland was founded at Edinburgh, but its degrees were denounced and have never been recognized by the grand lodge. Scotland has altogether 400 lodges.[2]

France.—The astronomer Lalande, in his article on this subject in the *Encyclopédie*, says that the first masonic lodge in France was founded by Lord Derwentwater at Hurre's Tavern, Paris, in 1725. The movement was at first largely patronized by the nobility. Louis XV. attempted to suppress it in 1737, and next year Clement XII. issued the bull *In Eminenti*, which denounces the *liberi muratori* and all secret societies, as the council of Trent had done before (xxv. c. 20). It is amusing to trace through the later bulls the inflated phrase of papal indignation,—*Provida* issued by Benedict XIV. in 1751, which, oblivious for the moment of the Society of Jesus, says, "honesta semper publica gaudent;" *Ecclesia a Jesus*, by Pius VII. in 1814, which refers especially to the Carbonari; *Quo Graviora*, by Leo XII. in 1826, which mourns over the corruption of the universities; and *Quanta Cura* by Pius IX. in 1864, which says, briefly but emphatically, *damnantur clandestinæ societates*. In France the tone of masonry was low. Admissions were sold at a fixed price without inquiry as to character. Salé invented a Freemason's dance for six. The order of *La Felicité* was disorderly; and the *Mopses* was invented to evade the papal prohibition. The Chevalier Ramsay in his *Relation Apologique* introduced the nonsensical *hauts grades*, with *novices*, *profès*, and *parfaits*, which he said were derived from the knights St. John of Malta, and had been preserved by "Mother Kilwinning." All this was probably a Jacobite propaganda. The nine high degrees, including Irish architect and Scotch apprentice, though discountenanced by the *Grande Loge Anglaise de France* in 1743, became very popular. The *Parfait Maçon* was published in 1744, and next year the *Maçonnerie Adonhiramique Devoilée* disclosed the intricacies of the "strict observance." There is

[1] As may be seen from the "marks" on Melrose Abbey, the older Scotch churches owe much to the skill of the Frenchman John Moreau and other foreign masons.

[2] An insight into the practical working of Freemasonry in Britain may be got from Oliver's *Institutes of Masonic Jurisprudence*, London, 1859, and from the other works of that prolific author. The *Freemason's Magazine and Masonic Mirror* is published weekly.

a tradition that Prince Charles Edward himself founded the *Chapitre Primordial de Rosecroix* at Arras. The Clermont ritual, which was elaborated under Jesuit influence, added three French degrees, which were founded on the story of the templars having taken refuge from the persecution of Philip IV. in the island of Mull. One of these degrees was *Chevalier de l'Aigle Élu*. In 1766, under the auspices of a new *Grande Loge Nationale* of France, afterwards called the *Grand Orient*, a representative system was at last adopted in which the "Souverain Conseil" was merged, and some degree of subordination among the various lodges was obtained. The confusion at this time between Dresden and Scotch rituals, between the old and simple forms of St. John and the wildest complications of Rosicrucian superstition, was increased by the appearance of Cagliostro and other systematic impostors. Cagliostro, as every one knows from Carlyle's famous essay, was the *Grand Cophta*[1] of the Egyptian system, a product of his own fertile brain. With the view of weeding the brotherhood of such rascals, the *Grand Orient* in 1777 introduced the *Mot de Semestre*, or biennial pass-word. The rivalry of such romantic systems as Martinism[2] was still, however, keenly felt, and in 1781 the Grand Orient adopted four of the higher degrees, viz., *élu, chevalier d'orient, écossais*, and *chevalier rosecroix*. All this while an active hostility was kept up between the Orient and the original Grand Lodge, each of which was supported by a separate Rosicrucian organization besides its own proper lodges. The work of both was suspended during the Revolution, but in 1799 a national union was effected by Roettiers. No sooner, however, was this done, and the statutes, originally based on the English constitutions, thoroughly revived, than French masonry again suffered from an invasion of mysticism,—first, in the form of the Scottish Philosophic Rite (including such profundities as the luminous ring and the white and black eagle), and, secondly, in the American Ancient and Accepted Scotch Rite of 33 degrees, which the charlatan De Grasse-Tilly expounded with great success, but which in 1804 was amalgamated with the *Grand Orient*, the great marshals Masséna and Kellermann being then the leading members of the two bodies. The union did not last, as Napoleon disliked the constitution of the *Suprême Conseil*, which was largely influenced by the aristocracy. His brother Joseph, assisted by Murat and Cambacérès, was allowed to take office in the older organization. An order of templars appeared in 1804, and was followed by the absurd *Rite Misraim*, which contains 90 degrees of the most fantastic kind. The French clergy in their denunciations of Freemasonry set an example of bigotry, which the masons themselves followed in their treatment of Clavel, author of *Histoire Pittoresque de la Franc-maçonnerie*, one of the few rational books on the subject in the language. During the reactionary Catholic policy of the grand master Murat the younger (1852–62), the liberties of the *Orient* were greatly interfered with and its funds almost exhausted. Since then it has slowly recovered. It has now 292 lodges; and the *Suprême Conseil*, which has become more democratic in constitution, has 50. The *Grand Orient* has lately ceased to require belief in a personal God as a test of membership.

Space does not admit of a detailed description of the advances of Freemasonry in other parts of Europe and in America. In Germany, where the chief lodge at Berlin is known as the grand royal mother lodge, *Zu den drei Welt-Kugeln*, it was patronized by Frederick the Great, and opposed by Maria Theresa. Its relations with the illuminati of Weishaupt are of extreme historical interest; and the question of the higher degrees was discussed at the great conference of Wilhelmsbad in 1782. The cause was helped by the adhesion of such great men as Lessing in his *Ernst und Falk, Gespräche für Freimaurer;* Herder in his *Adrastea;* Fichte in his *Briefe an Constant* and *Eleusinians of the 19th Century;* and Goethe, who wrote several masonic songs, and whose *Wilhelm Meister* is a favorite book among the craft. Germany has now 314 lodges, some of them, however, under the Swedish rite. The critical history of the institution and much of its general literature has been written there. The chief historians are Schröder, Krause, Fessler, and Findel. Kloss has published a bibliography which is supplemented by the American Barthelmess and by Findel. Marbach, Ritterhaus, and Löwe are the poets of the order in Germany as Morris is in America. One of the most recent German publications is *Sarsena, oder dêr Vollkommene Baumeister*, Leipsic, 1874. As regards America it is sufficient to refer to the great anti-masonic movement of 1826, which was caused by the kidnapping and supposed murder by masons of a man called Morgan of Batavia, and which continued for some time to influence the presidential elections. Convictions for abduction were obtained. There have for more than a century been negro lodges in the United States. In Brazil in 1876 the hostility between masonry and the Catholic Church was shown in the production of the play *Os Mason e os Jesuitas*, in which the dishonesty of the priest is contrasted with the manly virtue of the mason.

As regards the future of Freemasonry, it is impossible, at least for outsiders, to say much. The celebration of the brotherhood of man, and the cultivation of universal goodwill in the abstract, seem rather indefinite objects for any society in this unimaginative age. There is, on the one hand, a tendency to degenerate into mere conviviality; while, if schools, or asylums, or other charities are supported, to that extent of course the society becomes local and even exclusive in its character. In the mean time, masonry is to blame for keeping afloat in the minds of its members many of the most absolutely puerile ideas. A more accurate knowledge of its own singular and not undignified history would tend more than anything else to give worth and elevation to its aims. No one now believes the stupid slander that freemasons are engaged in any definite conspiracy against the state, religion, or social order. There is, however, something in their fundamental principles, the fraternity of men and their indifference to theological belief, and also in their recent movements, which perhaps justifies the suspicion, and even hatred, with which they are regarded by the Ultramontane party. Masonry in each country of course takes its coloring from the state of thought and feeling by which it is surrounded. But it cannot be disputed that the German, Dutch, Belgian, and French magazines of the craft occasionally exhibit a tone which is not favorable to Christianity regarded as a special revelation. The tendency of political opinion in such an association is also necessarily democratic; and while it would be absurd to make the brotherhood answerable for the opinions of Mazzini or the outrages of the commune, and while the majority of brethren are loyal subjects, and probably also orthodox Christians (in the theological sense), the institution itself undoubtedly "makes for" liberty in matters both civil and spiritual.

The singular myth that modern freemasonry is derived through Scotland from the historical order of the Templars has been treated in great detail and finally destroyed by Wilcke in his *History* of the Order, 2 vols., Halle, 1860. The claim was rested on (1) the *Charta transmissionis* or *tabula aurea Larmenii*, alleged to have been written in 1324 by Larmenius, the successor of grand-master Molay, who suffered in the persecution; (2) an old parchment copy of Templar statutes; (3) several alleged relics of the martyred Templars—all preserved in the archives of the Masonic Templars at Paris. An abstract of the controversy will be found in the appendix to Findel's *History*, which also contains the form of examination of a German Steinmetz, the Constitutions of the Masons of Strasburg (1459), including the Statutes of Parlierers and Fellows, and the Regulations of Apprentices; the Examination of the English Masons; a series of the old English Charges or Exhortations; the General Regulations of 1721; and the spurious Cologne Charter The appendix of Mr. Fort's work contains the *Règlements sur les Arts et Métiers de Paris*, of the 13th century, as collected by Étienne Boileau, provost under Louis IX. The masonic legend of *Die heiligen vier Gekrönten* is supposed to relate to the martyrdom, in the time of Diocletian, of four stonecutters named Claudius, Nicostratus, Sinforiamus, and Simplicius, to whose memory the small church *Quattro Santi Coronati* at Rome was sacred. In the second part of Mr. Fort's work will be found an accumulation of interesting facts relating to the early organization of masonic societies, their ceremonies, crypts and lodges, or places of meeting, and costumes; the payment of wages by warden, and the power of superintendence by master; the symbolic meaning of the hammer, the columns, the cord, the shoe; and the various uses of marks.

The word freemason has been derived from the Norman

[1] See Goethe's comedy of this name.

[2] Martin was connected with the *Chevaliers Bienfaisants, Amis Réunis*, and *Philosophes Inconnus*. He was a disciple of Jacob Boehme, and believed masonry to be divinely inspired. The system resembled that invented by the *Philalèthes*, of which Court de Gebelin, the Camisard historian, was a member.

French *Frère Maçon*, brother mason, and also from the expression freestone mason. The origin of the word mason is itself uncertain. The low Latin *macio* may be the German *Metz;* but Diez regards it as a modification of *marcio*, from *marcus*, a hammer. Littré suggests that the Latin *maceria*, a stone wall, may contain a radical *mac*, from which *macio* has been formed. This is rendered more probable by the Italian *macine* or *macigno*, a stone lap mill, where the root idea of mace or hammer, used for pounding corn, is referred to. Tiler, the name of a masonic officer stationed at the door of the lodge, obviously comes from *tailleur de pierre*, the lapidicine of several mediæval charters.

(W. C. S.)

FREEPORT, a city of Illinois, United States, the capital of Stephenson county, is situated on the Pekatonica river, 110 miles W.N.W. of Chicago. It is a rapidly increasing town, and possesses woollen and carpet manufactories, a foundry, a tannery, a beet-root sugar factory, and various kinds of agricultural instrument factories. The principal buildings are the court-house and the Presbyterian college, which was instituted in 1872. The population in 1850 was 1436, and in 1900, 13,258.

FREETOWN, a town of West Africa, capital of the British colony of Sierra Leone, stands on the south side of the estuary of the Sierra Leone river, about 5 miles from the cape of that name in 8° 29′ N. lat. and 13° 10′ W. long. It is situated on a plain which slopes up gradually from the river, and is closed in behind by a succession of wooded mountains. The town is divided into several quarters, the best of which is inhabited by Europeans, half-castes, and immigrants, who are either tradesmen or artificers, and the remainder solely by the black population, who congregate together in separate tribes. From the fact that both the houses in the best quarter and also the negro huts are surrounded by a court-yard or garden, the town covers an unusually large amount of space for the number of its inhabitants. The decomposed vegetable matter which is carried down the river, and driven back to the town by the tide, renders it very unhealthy, and unsuited for European residents, of whom there are only a small number. Freetown is the chief seat of the Sierra Leone trade, and a considerable sum of money has lately been expended on the construction of a new wharf. The principal buildings are the governor's residence and government offices, the barracks, the cathedral, the missionary institutions, and the grammar school. About two miles above Freetown, at Fourah Bay, the English Church Missionary Society has its principal West-African College, built in 1840, the ground having been purchased in 1827, and the work commenced in a temporary building. In 1876 the college was reorganized and affiliated to Durham university. The population is (1901) 34,463.

FREE TRADE. This expression has been appropriated, in a somewhat technical manner, to denote an unimpeded intercourse between such manufacturing and commercial communities as, having reciprocal interests, are under separate governments, and thereupon have separate financial systems. Thus the term is not applied to the facilities which town and country, laborer and capitalist, have obtained for reciprocal exchange, though these facilities have been acquired only in comparatively recent times. It is not used to describe the commercial intercourse of the three kingdoms, though restraints on the trade between Scotland and Ireland on the one side and England on the other were remitted, long after a political union between the three kingdoms had been effected, very grudgingly and very cautiously. Again, if we speak of free trade in land or free trade in banking, we use the term in a different sense from that in which it has been employed since the time of Adam Smith. But the phrase is technically used to designate such a commercial intercourse between any particular country, its colonies, and foreign countries, as gives the maximum of facilities for reciprocal exchange, and in the least degree attempts to make a fiscal system the means for stimulating and assisting domestic industry by protective enactments.

Free trade in the sense given to it above is advocated on two principal grounds, the one economical, the other political; and all arguments alleged in favor of it can be brought under one or other of these topics. It is resisted similarly for economical and political reasons,—not, indeed, in contradiction to those which are adduced in its favor, for these are absolutely irrefragable, but on the grounds that the industries of a country ought not to be defined by merely economical reasons, and that there are political interests which will not indeed annul, but must materially modify the universal and undeviating application of the free-trade principle. It will be the object of the present article to give a brief account of the controversy between the advocates of commercial freedom and those of commercial restraint, and to show how events, due to opinions which have long become obsolete, have strengthened the position of those who urge that the restraint of trade is and should be part of the function of Government. It is perhaps necessary, however, to meet an objection at once which might be taken, if it were not anticipated. Every civilized Government rightly and properly undertakes the supervision of contracts,—prohibiting some altogether, regulating others with less or greater strictness, and assuming the right to give an equitable interpretation to all; the application of the principles of equity to contracts being the most important improvement which modern civilization has induced on jurisprudence. Thus the law of civilized nations forbids any contract which would reduce one of the contracting parties to permanent slavery, though it compels the fulfilment of bargains which involve the temporary servitude of one of the parties. Again, it nullifies immoral bargains, though it does not profess to follow the consequences which a bargain that is *prima facie* innocent may have. Again, it subjects some callings to a police, either by exacting, in the case of certain professions, evidence of the individual's capacity, or by guarding continuously against any abuse which may arise from the exercise of a calling specially open to abuse, as in the case of houses for public entertainment, and the issue of paper money by banks. Furthermore, it subjects even simple contracts to revision—as, for example, cases in which exorbitant charges are made for loans. In these instances, and in others like them, a Government is only carrying out its primary duty in protecting its people from force or fraud, by controlling the free action of those who may inflict a serious injury on others. To define the extent indeed, to which such interference is necessary or desirable, is one of the hardest questions in what may be called the casuistry of politics. A country may be so over-governed by a watchful administration as to lose, to a greater or less extent, the spirit of enterprise or initiation, and thereby to be weakened in the legitimate rivalry of nations. But, on the other hand, it may be still more seriously weakened by the destruction of credit or confidence,—a result which is very likely to ensue when fraud is successful and unpunished.

Similarly a Government may control or prohibit intercourse between nations. If individuals have rights at all, one of the most obvious and important of these rights is that of choosing a market for their labor. But a Government would be admittedly justified in prohibiting the emigration of such artisans as are employed in the manufacture of munitions of war to a country with which itself was at war. It does more when it does not allow its harbors to be a refuge or a market for belligerents' ships, and prevents private individuals from supplying munitions of war to combatants. *A fortiori*, it would not allow its subjects to sell such goods to its enemies as might enable those enemies to protract their defence. It is a question whether it is not entitled to prohibit, or at least restrain, the exportation of that over which it is able to exercise a monopoly though it is very seldom, if, indeed, it is ever the case, that any country is in so advantageous a position. And, lastly, it is allowed that a Government may make the commercial intercourse of its subjects a matter of bargain with the Government of other countries, though such expedients, from an economical point of view, have been subjected to very adverse criticism. Free trade, then, must be innocuous and not hostile to the general public good.

Between nations, free trade represents the well-known principle of the Division of Employments. The advantages which result from the natural or spontaneous division of employments, and the loss which ensues from a forced division of employments are the commonplaces of economists. But the fact that exactly the same principle rules the distribution of production over such parts of the world as are occupied by industrial agents is not so frequently insisted on. That there are several commodities which a country cannot produce at all, or can only produce under circumstances so disadvantageous as to involve disproportionate expense or loss, is admitted by every Government, however anxious it may be to develop native industry by protective regulations. No European Government, however imperfectly civilized, would attempt to direct its home

industries into the production of tea, coffee, and chocolate, or to domesticate elephants for the sake of their ivory, or to breed ostriches for the sake of their plumes, or to maintain a race of wild hogs in order to obtain a due supply of bristles from native sources. But there are in most countries a number of industries the continuity of which Governments have attempted, and still attempt, to promote, by hindering the free entrance of foreign-made articles of the same kind. It will be found that, historically, this practice has had its origin in what is now understood to be a delusion as to the true functions of the currency.

The restraint of production and trade was a policy which ancient civilization never adopted. The great statesman of Athens congratulates his audience on the fact that, thanks to the extended commerce of their country, they are as familiar with the use of foreign products as they are with those of domestic industry, and use them even as freely as the country of their origin does. The public opinion of Greece was profoundly shocked when, as a measure of political animosity, Athens excluded a Greek city, Megara, from its market. The oldest public document preserved in the Roman archives was a commercial treaty with Carthage (Polybius, xii. 22), in which Roman merchants are indeed restrained from traffic in certain districts, more, we may be certain, from fear of the Carthaginian occupation of Italy than for other reasons, for the treaty expressly exempts traffic from tolls, and prescribes that Carthage shall build no factories in Latium. Nor is there any record of restraint put upon the distribution of the precious metals, except in one oration of Cicero, where the orator, defending his client from a charge of extorting money from the Asiatic Jews, comments on the public policy of hindering this people from disturbing the money market by sending great remittances of specie to Jerusalem.

Perhaps the explanation of the fact that the civilization of antiquity did not interfere with the process of international exchange is to be found in the prevalence of slavery. Setting aside for a moment the historical origin of modern protection, the influence and apparent truth of the mercantile system of which we shall speak immediately, there is a radical difference between ancient and modern civilization,—that in the former slavery was deemed natural, in the latter it has been seen to be mischievous and felt to be detestable. In modern societies, therefore, the free laborer is a factor in the interpretation of economical forces; in ancient ones he counted for nothing, or next to nothing. To have prohibited free trade in the products of foreign labor at Athens would have been to give advantage to one class of slave-holders in opposition or in contrast to another class of slave-holders, and was not to be thought of. To prohibit free trade between England and France, or England and the United States, is, in appearance at least, to assist the home labor of the country which adopts protection against the rivalry of free labor in another country which might undersell its rivals. Protection in ancient times would have been seen to be naked selfishness; in modern times it may seem to be a genuine and disinterested patriotism. And it may be observed that, for this and for other reasons, most slave-holding countries have been indifferent to protective regulations, or even unfriendly to them. This fact is sufficiently illustrated by the contrast of opinion in the northern and southern States of the American Union before the war of secession.

The control of production and trade in modern Europe is historically due to the development of what Adam Smith called the Mercantile System, *i.e.*, the effort of Government to secure as far as possible the largest possible amount of specie within the country whose affairs it administered. It is easy to discover the origin of this policy. To a Government which spends, but does not produce, the possession of treasure is of the greatest utility and service. To an individual who produces and trades, still more to one who trades only, treasure is, as a rule, the least valuable instrument of traffic, as it is an article from which, as it is affected by the least possible variation in value, the least amount of profit can be anticipated by those who deal in it as an article of trade. A trader in the Middle Ages would have readily accepted the doctrine that money was wealth as far as regarded every one but himself; as far as he was concerned, he wished to get rid of his money as soon as he could, in exchange for goods, on which he might secure his profits. The doctrine that the machinery of international trade supplied the process by which the precious metals were distributed, and that therefore, if trade were to exist, the attempts of Government to restrain the exportation of money were mischievous or nugatory, was argued as early as the middle of the 14th century by Sanuto the Venetian, and by Oresme the bishop of Lisieux, in language as precise as any used by Turgot or Adam Smith. The reasonings, however, by which protective theories were upheld, the mean and malignant arguments of restraint, as Adam Smith calls them, were always strengthened in England up to thirty years ago, by suggesting the hideous consequences which would come on the nation from a drain of gold. Protection had its origin in the reputed duty of Government towards the currency. Once established, it created artificial interests whose existence was a loss to the whole community, but whose maintenance seemed to be the satisfaction of a contract entered into between the Government and the industry which the Government had called into being or had stimulated.

It will be clear that if any particular industry is of such a character as to be very conveniently carried out by the inhabitants of a particular community or district, if the producer fears no rival in the home market, and still more if he dreads no competition in a foreign market, any protection accorded to his industry must be wholly superfluous. He might even contemplate an export duty with equanimity, though of course an export duty would be destructive of his foreign market if he had real rivals, and he would generally find that such a duty would not only limit the consumption of his produce, but would call a rivalry into existence. It is equally clear that if a protective duty were imposed on the importation of foreign commodities into a country which has already a marked superiority over other countries in these commodities, the regulation would have no effect in increasing either the profits of the producer or the cost of the article to the consumer,—that, in short, the enactment would be absolutely nugatory. It will be also plain that, in every country, there are certain commodities which are effectually shielded from foreign rivalry by the cost of carriage, and that such commodities possess the superiority which other products enjoy from the peculiar facilities which a particular country has in manufacturing them. A protective system then is inevitably concerned with such products as are liable to foreign rivalry, and a foreign rivalry can only be defeated at the cost of the consumer. But as the protective regulation can affect prices in that country only which imposes the regulation, it is obvious that the only person who can be made to bear the increased cost which the protective restraint imposes will be the home consumer. If the produce could find a market at home, there would be no need of the assistance; if it cannot subsist at home without a machinery which guarantees the profit of the producer, the domestic consumer is the only person who can be made to contribute the fund from which the profit is made.

The positions stated above receive a significant but complete illustration from the economical history of England A century ago the English landowners were free traders, the English merchants protectionists. Adam Smith rested all his hopes of a better system on the former class, but despaired of any co-operation from the latter. Twenty years after the *Wealth of Nations* was published, the mercantile and manufacturing classes, with few exceptions, were free traders; the landowners, with few exceptions, were protectionists. The explanation of the change in sentiment is to be found in the change of interests. Up to the middle of the 18th century England exported considerable quantities of agricultural produce,—sometimes naturally, at other times under the wholly indefensible stimulus of a bounty on exportation. Now it needs very little intelligence to discover that the profits of an exporter, or at any rate the extension of his trade, depend largely on the variety of imports which he can obtain in exchange for his goods. A country which puts no hindrance on imports always deals to the greatest advantage, and the advantage decreases with restraint. If a country refused to admit any import but one, *i.e.*, money, it would sell its exports in the worst possible market, and for the least possible value, receiving in return an article which the machinery of its trade takes the most effectual possible means to depreciate. Hence the landowners of the 18th century, like the agriculturists of the western and southern States of America now, were free-traders, because free trade was their best hope of profit. The manufacturers, on the other hand, were profoundly

afraid of foreign rivalry, even the rivalry of the British colonies, even the rivalry of Ireland. Perhaps the most grotesque illustration of this fear was the law which directed under strict penalties that the dead should be buried in woollen, in order to encourage the woollen manufactures.

The change of sentiment was due to the great mechanical industries of the 18th century. The discoveries of Arkwright, of Watt, of Hargreaves, of Crompton, gave England a practical monopoly of textile fabrics, and subsequently of other products nearly as important. No doubt the Berlin and Milan decrees interfered with the Continental trade of England, though it is well known that Napoleon's soldiers were clothed, in spite of these decrees, in the produce of north-eastern and west country looms. But in other parts of the world England had no rivals, while her supremacy on sea, after the great victory of Trafalgar, guaranteed her traffic. Hence, when the merchant and manufacturer, especially the latter, discovered that protection had ceased to be an advantage to them, and discovered also, for the reasons given above, that the restraint of imports was a disadvantage to production and exportation, the principles of free trade made rapid progress in the manufacturing districts of England. But on the other hand, the very reverse opinion influenced the minds of the landowners. Owing partly to the succession of late harvests, partly to the rapid growth of population consequent upon manufacturing enterprise, partly to the restriction of Continental supply, the result of war, of the great drain which war made on the agricultural population of Europe, and of hindrances put on the import of food,—rents and farmers' profits rose with amazing rapidity, and the Corn Law of 1815 was enacted in order to secure, if possible, the permanence of such rents and profits. The partisans of free trade and protection were only by accident allied to the great historical parties of English public life. The struggle for free trade was really one between town and country, as hereafter efforts in the same direction will get their advocates from the same classes.

It may be believed that, in England at least, the question of protection to manufactures is finally settled, though there are not wanting persons who advocate reciprocity, co-ordinate taxation on foreign products, retaliatory duties on reputed bounties, and the like. But the traditions of legislation are too firmly fixed, and the benefits of free trade experienced during the past thirty years are so generally admitted, that the advocacy of the exploded theory of protection is looked on as a harmless whim which has no chance of popularity. It is not perhaps equally clear that the English people are quite safe against the revival of protection to agriculture under the pretence of sanitary restraint, for that which is the inevitable result of protection to manufacture, the limitation of voluntary consumption, is not so markedly developed from the protection which may be accorded to articles of necessary consumption.
